This relativist focus has also partially influenced anthropology. It has, among other things, involved a discussion of the validity of the cultural representations of ethnography and of what form such representations can and ought to assume. This discussion of ethnographical representations, the conversion of lived life into text (Marcus & Fischer, 1986), can be seen as an illustration of the kind of meaning that is ascribed to language within the recent practice-oriented tendency: There is considerable interest in linguistic practice, text, and discourse in a more general sense, but only relatively sporadic interest in language diversity, including the significance of the various languages for epistemological knowledge (see the traditional Whorfian discussion).

Transnational and Global Approaches

There is a very strong tradition of microlevel studies in anthropology, that is, studies of local communities at different levels, including the interpersonal, interactional level. But from the 1990s some scholars developed approaches that focus on cultural processes and practices at the global and transnational macrolevels, for example Hannerz (1992) and Appadurai (1996), who are also influenced by the cultural studies movement.

Hannerz conceptualizes culture as meaning and focuses on the social organization of meaning, with particular reference to transnational cultural flows and local cultural complexity (Hannerz, 1992). In Hannerz's theory culture has two loci, an external and an internal: The external locus is meaningful, externalized forms such as speech, gestures, song, dance, and decoration. The internal locus of culture is meaning in consciousness—not perceived as an idealized consciousness but as that of concrete human beings. The individual's share in culture he mainly describes with the aid of the hermeneutical concepts of perspective and horizon: Each human being is unique in his or her experience-based, socially influenced perspective on the outside world, and his or her horizon is reflected by personal life experiences and education. At the individual level, society is thus seen as a network of perspectives. The two loci of culture are each other's prerequisites, and the cultural process takes place in the interaction between them, at the societal micro- and macrolevels. It occurs partly in the concrete interaction between people in interpersonal situations, but also at higher levels, right up to the highest level: the global level, via the distribution of goods and mass communication.

Hannerz, then, adopts a macroanthropological perspective. He studies, among other things, how cultural distribution processes of various, possibly global, extents result in local complexity. He emphasizes that cultural flow takes place in real time and has a direction; it is also socially organized and characterized by power structures. At the global level, the main cultural flow passes from the world's cultural centers to the periphery, but there is also flow that passes from the periphery toward the centers, as people on the periphery create new culture by utilizing both imported and local resources.

Appadurai takes as his starting point the idea that we are living a rupture in modernity where ordinary people, because of the intensified interplay of transnational migration and the use of transnational media representations, have begun to deploy their imaginations

in the practice of their everyday lives. Thus more people than ever before seem to imagine routinely the possibility that they or their children will live and work in places other than where they were born (Appadurai, 1996). He emphasizes that he is not so interested in the imagination of the single individual but mainly in collective imagination made possible by the mass media. He is critical of using the term “culture” as a noun, and prefers to use it as an adjective: cultural. His concept of culture is thus quite different from Hannerz’s: Whereas Hannerz’s concept of culture is focused on the production and spread of meaning in a very general sense, Appadurai chooses to see culture as difference. Among the many possible cultural differences, he suggests to focus on those that either express or set the groundwork for the mobilization of group identities. Those identities may be of any kind—ethnic, national, religious, linguistic, professional, sports related, lifestyle related, and so on—and, if they are transnational, they greatly contribute to the development of transnational imageries.

This choice makes it relevant to discuss the concept of culturalism, and Appadurai proposes that this concept be used when we are dealing with movements that involve the conscious mobilization of cultural differences in the service of a larger national or transnational politics. It may be for example the identity politics of African Americans, Pakistanis in Britain, Algerians in France, native Hawaiians, Sikhs, French speakers in Canada, and so on. Appadurai notes that culturalist movements are the most general form of the work of the imagination and frequently draw on the fact or possibility of migration or secession. Thus, Appadurai much more than Hannerz stresses the political nature of collective identity formation (Risager, 2009).

Appadurai has proposed to describe the current global situation as a fundamental disjuncture between a number of processes, and he uses the term “-scape” (from “landscape”) to bring forth a certain imagery of these more or less separate processes as fluid and irregular landscapes. He thus distinguishes between *ethnoscape*, *mediascape*, *technoscape*, *financescape*, and *ideoscape*. The first two are those to which he has given most attention. *Ethnoscape* is the landscape of people in the world, either as moving over longer or shorter distances for one reason or another (migrants, refugees, expats, tourists, students, etc.) or as more sedentary; *ethnoscape* is not only about actual physical mobility but also about fantasies about moving, wanting to settle, wanting to control migrations, and so on. *Mediascape* is both the specific distribution of media throughout the world and the images of the world created by these media. *Mediascape* contributes to the collective imagination through the proliferation of realistic and fictional representations in a wide range of genres and styles.

Political and Strategic Uses of Culture

Like Appadurai, a number of anthropologists have emphasized the importance of awareness of the power dimension in studies of culture, including the very problematic role of anthropology in colonial history. L. Abu-Lughod, for example, calls for an ethnography that writes not with culture, but against culture (1991). She argues that culture is a concept that operates to enforce separations that inevitably carry a sense of hierarchy. The concept of culture is a term for the self–other relationship, and this is always a relationship of power. Referring to experience from feminist anthropology she argues that anthropologists always have to be aware of their positionality (Western/non-Western, gender, class, race, etc.), and reflect on the actual situatedness of their knowledge. She proposes to avoid using the concept of culture, and to prefer terms like “discourse” (see Foucault) and “practice” (see Bourdieu). She also calls for a stronger emphasis on narrative ethnographies of the particular, studies that do not try to make cultural generalizations.

G. Baumann is also interested in the uses of culture, but he focuses on popular uses of the term in multicultural, multiethnic communities in big cities such as London. He coined

the expression “the double discourse of culture.” According to Baumann (1996), people’s discourses (in his empirical studies) can be categorized into two types: One type is a discourse equating community with culture. It is a reifying discourse used by everyone, and it is also found in the media and in public and political debates. Baumann calls this “the dominant discourse.” The second type is a more creative, but also reifying, discourse that attempts to question and redraw identities within and across these communities. This kind of discourse is used by many people as well, and it may be seen to contest the dominant discourse. Baumann calls this “the demotic discourse.” His major point is that both discourses are widespread and legitimate and used for specific purposes in different settings. The dominant discourse may be useful not least when people compete for funding or fight for their rights.

In a later study, Baumann (1999) introduces two other terms: “essentialist discourse” and “processual discourse.” The essentialist discourse regards national cultures, ethnic cultures, and religious cultures, for example, as finished objects, as something people have or can be members of. This discourse is very popular. The processual discourse is represented by academic discourse that describes practices in processual terms and tries to deconstruct essentialist perceptions of human groups. The processual discourse deals with culture as something people do or create. Baumann’s main point is that both discourses are legitimate and have to be incorporated in a total picture of cultural processes. Thus he says that it is not the case that we have a choice between a false but popular “theory” and a scientifically productive but unpopular theory. We have two types of discourses operating and interacting in the same field. Baumann states that ordinary people can be observed to command what he calls a double (or dual) discursive competence, and he is of the opinion that they develop this dual competence more strongly the more they expose themselves to multi-cultural practices (Risager, 2009).

In conclusion it can be said that both Abu-Lughod and Baumann represent the growing concern in anthropology about the dangers and dilemmas related to the concept of culture and its political and strategic uses. It is a hypercomplex concept that is very elusive indeed. The use of the concept seems unavoidable in some parts of applied linguistics, but it is important to be aware of the complex and conflicting meanings associated with the term as a part of European and Western thought.

Culture and Context: Overview

KAREN RISAGER

Introduction

Large parts of structural and functional linguistics have been developed and practiced without any reference to the role of language in culture and society. In applied linguistics, in contrast, the separation between language and culture is not possible because the very purpose of applied linguistics is to investigate the interface between language practices and other cultural and social practices in the real world, whether the primary aim is improvement or critique of existing practices. Thus the whole of applied linguistics can be said to be oriented toward an interest in language in relation to culture and context. For a comprehensive conceptual analysis of the relationship between language and culture in a historical and transnational perspective, see Risager (2006, 2007).

The section on culture and context in this encyclopedia emphasizes the importance of this relationship, as well as its diverse and interdisciplinary character. In order to capture the meaning of the culture and context connection in applied linguistics the section covers entries on a wide range of relevant fields and concepts such as anthropological linguistics, cultural linguistics, sociocultural theory, critical applied linguistics and postcolonial studies, cultural studies, and culture in language teaching and learning, in addition to important concepts such as ethnicity, nation, citizenship education, and intercultural competence. One of the entries is a general introduction to LANGUAGE, CULTURE, AND CONTEXT aimed at a general audience and highlighting some central issues related to the study of language and context, and the study of language and culture.

Most of the entries in this section have been written by applied linguists who are working interdisciplinarily. Others have a nonlinguistic background and write about their topics from another perspective, for example anthropology, in order to achieve an in-depth understanding of each topic. Perspectives from neighboring disciplines include anthropology, cultural studies, cultural sociology, literature studies, and literature pedagogy.

Anthropological Linguistics

Among the fields focusing on language in relation to culture one must first mention ANTHROPOLOGICAL LINGUISTICS, sometimes called linguistic anthropology. This field has forerunners in 19th-century Europe, especially in the German-speaking areas (Herder, Humboldt), but was developed as a distinct discipline in the early 20th century in the USA by German-born Boas, as one of four interrelated subdisciplines of anthropology: physical anthropology, archeological anthropology, cultural anthropology, and linguistic anthropology. Linguistic anthropology/anthropological linguistics was further developed by a long range of other scholars such as Sapir, Whorf, Goodenough, Agar, and Duranti, not only in the USA, but worldwide (Foley, 1997). This field of interest has developed from the study of American-Indian and other indigenous languages and cultures to include language and culture in and across various groups in modern society. Anthropological linguistics often uses ethnographic methods in the study of language practices seen as cultural practices, for example, conversational exchanges and their culturally specific pragmatics.

2 CULTURE AND CONTEXT: OVERVIEW

It should be added that most of British or French social anthropology has not been very interested in the role of language, with important exceptions like Malinowski, Ardener, and Lévi-Strauss.

Cultural Linguistics

Another field that deals with language and culture is **CULTURAL LINGUISTICS**, developed since the 1990s (Palmer, 1996). Whereas anthropological linguistics is often interested in language practices in communicative events embedded in specific cultural and social contexts, cultural linguistics primarily takes a cognitive perspective and focuses on the relationship between language and culture in the minds of different language groups. It is interested in the description and analysis of cultural scripts and models, such as our conceptions of time and space and how these are reflected in our language and language use, for example in metaphors and metonyms.

Sociocultural Theory

Yet another field that emphasizes the relationship between language and culture is **SOCIO-CULTURAL THEORY**, originally conceived by the Russian psychologist Vygotsky and later exploited by (among others) applied linguists, especially within the areas of language socialization and language learning (Lantolf & Thorne, 2006). This perspective emphasizes developmental and learning processes as embedded in the specific sociocultural context, and typically investigates how social interaction with people surrounding the individual—parents, teachers, peers, and so forth—plays a decisive role in developmental and learning processes, for example, concerning the learning of first, second, and foreign languages. It has been suggested that the interdisciplinary field concerned with the intersection of language, culture, and society could be called sociocultural linguistics (Bucholtz & Hall, 2005).

Critical Applied Linguistics and Postcolonial Studies

The study of language in relation to social context (whether conceived as micro or macro) has been of central concern in the vast and growing field of sociolinguistics, and this field is treated in depth in other sections of this encyclopedia. This section on culture and context, however, includes an entry on **CRITICAL APPLIED LINGUISTICS** in order to highlight the importance of studies of power in applied linguistics (Pennycook, 2001). Critical applied linguistics has developed as a special topic area since the 1990s and foregrounds studies that investigate and critique language practices (in language policy, in language teaching, and other fields) in terms of processes of marginalization, hierarchization, minorization, otherization, racialization, culturalization, and other forms of dominance, as well as resistance or struggle against them. This field often draws on perspectives from studies of globalization and **POSTCOLONIAL STUDIES**, perspectives that insist on a global and historical understanding of how power relations have developed and are developing.

Cultural Studies

The interdisciplinary field of **CULTURAL STUDIES** has also been included. This field has its origin in British studies of working class culture from the 1960s, and soon widened its scope to studies of youth culture and media culture, spreading to the United States of America and other parts of the world (Hall, 1996). It has developed into a very wide and

complex field dealing with issues of culture, identity, and power related to race, ethnicity, nationality, gender, sexuality, age, class, religion, and other sociocultural parameters. It may take local, transnational, and global perspectives, including studies of migration and diaspora studies. Until now this field has not been very interested in the study of language as a sociocultural parameter (languages in the plural), but it is very interested in human language in general, often taking a poststructuralist and social constructionist perspective on language as discourse and as one of the semiotic means in the construction of cultural representations (i.e., representations of culture and society in oral and written texts, movies, commercials, maps, museums, etc.).

Culture in Language Teaching and Learning

Last, but not least, one of the biggest areas of applied linguistics itself should be mentioned, namely foreign/second language teaching and learning. In this field there have been discussions and research on the relationship between language, culture, and society for more than a century, and especially since the 1980s. Teachers and scholars have been discussing topics such as the sociocultural content of textbooks, progression in texts and topics, different methods, the role of vocabulary teaching, the role of nonverbal communication, the importance of cultural awareness (or cultural knowledge, insight, understanding), the management of stereotypes, the role of cultural imagination, intercultural learning processes, assessment of intercultural competence, internationalization and the role of cultural experiences and personal encounters *in vivo* or via the Internet, education for intercultural citizenship, and national versus transnational perspectives.

Thus the field has seen a large number of people developing their views on language and culture in language teaching and learning, views that are so theoretically diverse that it would be somewhat problematic to introduce the whole field in a short entry (see the historical analysis in Risager, 2007, and the research timeline in Risager, 2011). Instead, there are quite a number of entries dealing with different aspects related to the field (see below).

Concepts

In addition to entries on the relevant fields of study, the section includes a number of specific entries on central concepts. First of all, the concept of CULTURE is introduced as a hypercomplex concept in Western thought. The concept of SUBJECTIVITY is introduced, as is the concept of LINGUACULTURE, that is, the cultural dimensions of language. In connection with these, the concepts CULTURAL IDENTITY, CULTURAL HYBRIDITY, and CULTURAL CAPITAL are also included.

Second, a number of important concepts are described that often occur in cultural analysis: NATION, ETHNICITY, RACE, and RELIGION. Concepts like gender, age, and class could have been included here as well, but they represent parameters that have been treated quite frequently in sociolinguistically oriented parts of applied linguistics, and we therefore refer to such sections.

Third, topics related to language teaching and learning are the following: INTERCULTURAL COMPETENCE, INTERCULTURAL LEARNING, INTERCULTURAL UNDERSTANDING WITH LITERARY TEXTS AND FEATURE FILMS, INTERCULTURAL COMMUNICATION, and MULTICULTURALISM AND SECOND LANGUAGE LEARNING. There are also entries on CRITICAL PEDAGOGY, on CITIZENSHIP EDUCATION, and on HUMAN RIGHTS. And finally there are entries on the topics CULTURAL REPRESENTATION, CULTURE IN TEXTBOOK ANALYSIS AND EVALUATION, and intercultural learning in relation to STUDY ABROAD.

A Vast Area With Many Voices

The field “language in relation to culture and context” is a vast area, and many different voices are being heard. The following renowned scholars have been chosen to feature in biographical entries from a much larger set of distinguished actors in the field: Michael AGAR, Mikhail M. BAKHTIN, Lothar BREDELLA, Michael BYRAM, A. Suresh CANAGARAJAH, Alessandro DURANTI, Manuela GUILHERME, Hartmut HABERLAND, Adrian HOLLIDAY, B. KUMARAVADIVELU, Aneta PAVLENKO, Alastair PENNYCOOK, Karen RISAGER, Edward SAPIR, and Geneviève ZARATE. Their biographies reveal a diverse set of backgrounds but also a shared interest in exploiting the possibilities of combining and synthesizing different fields of knowledge and disciplinary traditions in the interface between studies of language and studies of culture and society.

Culture and Language for Specific Purposes

ULLA CONNOR AND WILLIAM ROZYCKI

A classic definition of culture has been formulated as follows by the anthropologists Kroeber and Kluckhohn (1963):

Culture consists of patterns, explicit and implicit, of and for behavior acquired and transmitted by symbols, constituting the distinctive achievement of human groups, including their embodiments of artifacts; the essential core of culture consists of traditional (i.e., historically derived and selected) ideas and especially their attached values; culture systems may, on the one hand, be considered as products of actions, on the other as conditioning elements of further action. (p. 357)

The all-encompassing nature of culture as described above presents a problem in applying the concept to specific language learning and specific language pedagogy. Culture has for some time been a contested term, and in part this is because “culture” can mean almost anything in human experience. And, as seen above, culture can be taken as either the product or the conditioning factor of human behavior. Thus, to be of value in explaining or informing aspects of language for specific purposes (LSP), any use of the term must be accompanied by rigorous delineation and clear conceptual boundaries.

Within LSP, there are two distinct but complimentary conceptualizations of culture that are in evidence. Each has played a role in explicating the LSP process. The first, which can be called the traditional or received view of culture, derives directly from the anthropologic formulation of culture encapsulated in the definition offered above by Kroeber and Kluckhohn. This earliest and most widespread conceptualization of culture is commonly applied to the shared values, artifacts, and behaviors of an ethnic, tribal, regional, or national group. The anthropologist Mathews (2000) calls this traditional view “the way of life of the people” (p. 2). Thus we see formulations such as “Hispanic culture,” “Papua New Guinean culture,” “Asian culture,” “German culture,” and so forth.

The second view of culture has emerged from criticism that the traditional formulation easily stereotypes those considered to be different. This postmodern view problematizes the idea of culture, seen as being tainted by the subjectivity of the viewer/commentator. Some proponents of this more recent view highlight the complexity of culture, and cultures are seen as dynamic and in flux. Furthermore, diversity is seen to exist not only between ethnic and national groups, but also within such groups.

In a similar vein, instead of seeing cultures as products, Street (1993) introduced the notion of culture as a verb, whereby culture is not a fixed thing. It is seen as ever changing, subject to, and yet influencing the dynamics of instantiated interaction.

Examples of Traditional Views of Culture in ESP/LSP

The traditional and, in the 20th century, extremely common conceptualization of culture has been an important aspect of English for specific purposes (ESP). Jordan (1997) in *English*

for Academic Purposes devotes an entire chapter to discussing cultural differences in learning styles and strategies of EAP students new to Britain. He writes that EAP students “normally retain the learning style they have utilized throughout their school life” (p. 95), and this often conflicts with teacher expectations. He also mentions differences in academic cultures and how they can cause problems for ESP learners. Cultural mismatches can occur due to many aspects of academic life: different lecture styles, different means of evaluation (multiple choice examinations versus essay tests), punctuality in attending seminars and tutorials, use of libraries as quiet places, and certain expected polite conventions in addressing faculty and staff.

Basturkmen (2006) also includes cultural knowledge as part of knowledge objectives in ESP, along with language, affective, and transfer objectives. Cultural knowledge objectives refer to the control of sociocultural rules. As an example of teaching underlying knowledge in business communication, she mentions the importance of the teaching of not only strategies of buyers and sellers but also of different national cultural differences.

Barron (1991) lamented the neglect of using learners’ culture to pedagogical advantage: “ESP has so far totally ignored the traditional cultures of students” (p. 173). Barron examined an ESP for science program in Papua New Guinea, drawing on his own experience as an instructor/planner with the program. He cites one main reason for the neglect of traditional culture, namely the belief that science is culturally neutral. Barron voiced his disagreement with the view that “there is an independent scientific culture that is the same all over the world, which is secondary to particular cultures” (p. 176). According to Barron, science is an integral part of primary cultural systems. He posits that in Papua New Guinea, a less literate society, technology is concrete rather than abstract, taking shape in ways that can be seen, heard, touched, and felt. Barron underscores the important role ESP can have in effecting a smooth transition from the concrete textualization of technology in Papua New Guinea society to the abstract and theoretically based Western textualization that appears in English. Adopting this view, teachers of ESP for science and technology should encourage their students to draw upon already-present cultural resources—irrespective of the literacy level of their society—rather than starting with a blank slate in addressing Western technology and science.

Examples of Alternative Views of Culture in ESP/LSP

The second, alternative conceptualization of culture has emerged more recently from criticism of the traditional formulation. Keesing (1994) has attacked the received concept of culture because it reifies the “other,” distancing the formulator from those perceived to be different, and permitting self-identity only by labeling what one is not. This postmodern view, as proposed by Keesing and others, would discard the idea of culture as hopelessly tainted by the subjectivity of the user.

Holliday (1994, 1999) introduced a model of culture that considers both large (i.e., ethnic and national) cultures and small (i.e., disciplinary, gender) cultures. Holliday’s theory is especially helpful in understanding the complexity of a classroom where national, professional, and student cultures overlap. Other critics of the traditional view, for example, Ramanathan and Atkinson (1999), expand this concept, maintaining that tremendous diversity exists not only between ethnic or national groups, but also within such groups. Thus, the traditional concept of ethnic culture need not be discarded, but is complemented by a new conceptualization of culture. Such proponents draw from the work of Giddens (1979) the idea of multiple small cultures that cross the boundaries of traditional ethnic culture. Holliday (1999) demonstrates the sociolinguistic ramifications of small cultures. Atkinson (1999) suggests the language classroom is home to institutional, disciplinary, generational,

and other small cultures that interact and interrelate. Kramsch (2001) sees the language classroom as composed of “shifting identities and cross-cultural networks” (p. 205). This view of the flux of multiple small cultures is emphasized by Dudley-Evans and St. John, in their comprehensive reference book on ESP (1998), when they state that culture is complex, that it “comprises various aspects such as national, professional, organizational and personal cultures” (p. 66).

This newer and more encompassing view of culture, that of multiple cultures, can inform otherwise puzzling research findings in LSP. For example, Sullivan and Girginer (2002) performed a discourse analysis of international aviation radio conversations between pilots and air traffic controllers. Though there is a canonical vocabulary and grammar for civil aviation communication (Airspeak) that is prescribed and controlled by the International Civil Aviation Organization (ICAO), analysis of 9 hours of recorded radio conversations describes use of noncanonical speech (e.g., call sign “2211” was expressed as call sign “double two double one” in place of the prescribed “two two one one”; instead of the canonical term “on your frequency,” the nonstandard “with you” was used). Though Sullivan and Girginer did not analyze the reasons for this discrepancy, it may be theorized that generational culture (shared by veteran pilots) valued nonstandard language to mark experience. Since pilots and air traffic controllers begin their careers with only the input of the ICAO-approved language guidelines, it is only seasoned veterans who can pick up this type of speech and use it to demonstrate their veteran status.

An example of an ESP classroom which shows the overlapping national, disciplinary, and individual cultures, is described in Connor, Rozycki, and McIntosh (2006). The program was a six-month ESP program in business, finance, and economics, offered to staff from the Ministry of Finance of the People’s Republic of China at a US language institute. The instructors had to take account of the small cultures (e.g., age, gender, professional affiliation, and identity) issues among the participants sharing the same large (Chinese) culture background.

Adoption of a middle ground approach that recognizes national/ethnic culture while accepting the existence of myriad small cultures is recommended by Atkinson (1999) for applied linguistics in general and is especially suited for LSP. The middle ground approach sees all humans as individuals but acknowledges that individuality is also cultural. “Knowing students individually also involves knowing them culturally” (p. 643). So, even if we downplay outmoded, stereotyping views of culture, we need to know as much about our students’ local and social practices as we can.

A fertile area of research remains in LSP to explore this middle ground. With the increased globalization of business, industry, and academic disciplines, it is important that, through linguistic research, we discover language and communication strategies used in real-life intercultural encounters. From such research findings, LSP instruction can take account of the cultural and linguistic fluidity of interactions, keeping in mind the complex interactions of small and large cultures.

Culture in Textbook Analysis and Evaluation

KAREN RISAGER AND CAROL A. CHAPELLE

Introduction

Textbooks often play a central role in the formal teaching of foreign and second languages, especially at beginning level. To this day, much language teaching is structured by published textbooks, even if it is supplemented with other materials from the Internet or elsewhere. In view of the importance of textbooks in providing learners with their first authoritative glimpses of the target culture, only a little work in applied linguistics has explored issues concerning the choice of cultural content for textbooks. However, the research that has been conducted points to the importance of different ways of representing culture, the ideological dimensions of cultural choices authors make, as well as the variety of methodological perspectives that are useful.

Cultural Representation: Modernism and Postmodernism

The central culture-related question for language textbook analysis reflects the tension between modernist and postmodernist perspectives: Is it possible to define and present an objective image of the foreign culture, or is the content of the textbook always dependent on the cultural perspective of the author(s), located in time and space? The modernist approach emphasizes knowledge of facts and structures. It demands of the textbook that it present a maximally true, realistic, and representative picture of the foreign society and culture. It should present “society in a nutshell,” or present “a panorama of the culture.” Most textbook production is influenced by this perspective, trying to offer learners some basic and authoritative knowledge of the target language country/ies, written by authors who do not intend to show explicitly any subjective evaluation of the material presented.

The postmodernist approach, in contrast, emphasizes the role of different perspectives in cultural representation. In postmodernism, culture is dependent on the eyes that see. Some of the proponents of this approach take an explicit antiessentialist stance, maintaining that there is not “a culture” out there to describe, but that any descriptions and stories about others are always social and cultural constructions produced from a particular perspective and under specific historical and social circumstances.

These questions are important for textbook analysis, but they are very seldom if ever raised in the textbooks themselves, and the textbook authors remain more or less anonymous to students and teachers, who are unlikely to ask questions such as why the author chose to include characters of a particular nationality or particular locations within a particular country. Scholars in applied linguistics, however, have raised the discussion of modernism, postmodernism, and antiessentialism in textbook production and analysis (Kramsch, 1988; Zarate, 1993; Risager, 1998).

Cultural Choices: The National Tradition and Transnational Challenge

From around 1850 until around 1990, foreign and second language teaching including textbooks was entirely dominated by the national paradigm. This means that the cultural content has been focused on the country/ies in which the target language is the main first language or official language. The frame of description has been the nation-state, most often presented as "the country," seen in isolation as expressed by the metaphors "society in a nutshell" or "panorama of the culture." Prior to this period, the content of language textbooks typically had a much broader, almost encyclopedic character, encompassing for example the elements, the earth, the body, the economy, grammar, music, geography, history, and angels (Comenius, 1649; see also Risager, 2007).

A number of analyses of textbooks conceived in the national tradition have appeared, particularly in Europe, where the integration process following World War II raised awareness of the importance of cultural knowledge and understanding. It was widely realized that language teaching and the cultural content of textbooks could be important contributors to an increased awareness of cultural similarities and differences among the European nation-states. For instance, a joint British–German project conducted an analysis and evaluation of the representation of Britain in German textbooks for the teaching of English (Doyé, 1991) and a corresponding analysis of the representation of Germany in British textbooks for the teaching of German (Byram, 1993). The project was mostly conceived within the modernist approach, emphasizing accuracy, representativeness, realism, and educational potential. Other analyses along these lines were conducted by Krauskopf (1985), Friz (1991), and Wegner (1999). Risager (1991) analyzed trends in the cultural representations displayed in European language textbooks. The analysis was mainly conceived in the modernist and national tradition but underscored the need for authors to include topics on international and intercultural processes and relations in textbooks.

Sercu (2000) conducted a major empirical project on the teaching of German in Flemish-speaking Belgium, also within the national approach. She studied the development of pupils' intercultural communicative competence, and her investigation dealt both with pupils' perceptions of Germany and with the sociocultural content of six different textbooks used in the classrooms. Among the results of the analysis of the textbooks was an analytical distinction between two types of perspectives in the cultural representation of the textbooks: the outsider/tourist perspective and the insider/family perspective. The first perspective tends to focus on cultural differences, including a number of informative details about society and culture but presenting a relatively flat description of characters. The other tends to focus on both differences and similarities. It provides less information on society and culture, and the description of characters is more rounded. Among Sercu's conclusions was that intercultural competence is best supported if textbooks comprise many different perspectives, both from within and without, and if topics are clearly directed toward the knowledge and interests of the pupils.

Since the 1990s the national paradigm has been increasingly problematized, particularly within the teaching of English as an international language. The problem is illuminated by Risager's (2007) analysis of the international history of culture pedagogy since the 1880s, which includes discussion of discourses on language, culture, and nation, and which traces the transition from a national paradigm to the beginnings of a transnational and global paradigm, not only for English, but for any language taught as first, second, or foreign language.

One aspect of this development toward a more global outlook is the wish to include not only "center" countries like France in the teaching of French, but also other French-speaking countries and areas, taking a more international and perhaps postcolonial and global

perspective. An example could be the textbook for French, *Orientations*, described in Starkey (1991), which has been elaborated with a view to developing pupils' awareness of transnational and global issues.

Such a perspective toward culture in textbooks requires authors and analysts to reason in order to justify choices of cultural content. Finding little Canadian and Quebecois cultural content of beginning French language teaching materials in use in schools in the northern United States, Chapelle (2009) uses the transnational paradigm to argue that American students living in the northern United States should learn about the language and culture of Canada and Quebec. She points out the value of Canadian and Quebecois cultural content which offers opportunities to explore aspects of local historical, linguistic, and cultural diversity, such as the non-neutral, political role of language and identity in Canadian society, and the complex history of migration of French Canadians across the US–Canadian border. Such ideologically different perspectives are potentially useful in the US context, where a goal for foreign language teaching is for students to increase intercultural competence, which encompasses their ability to critically examine such American assumptions as the normality of monolingualism and the neutrality of language (Chapelle, 2010).

Such an analysis of cultural value needs to include not only the target culture but the students' own cultural background and needs. Adaskou, Britten, and Fahsi (1990) proposed, for example, that the production of textbooks for English taught as a lingua franca in Morocco focuses on the learners' own country, enabling them to describe and appreciate their own culture in communication with foreigners (see also the analysis in Cortazzi & Jin, 1999).

Research Purposes and Methods

Textbooks may be analyzed for a variety of purposes and from many different angles. First of all, it is important to distinguish between practical and scientific purposes. A practical purpose could be the evaluation of textbooks with respect to their usefulness in classroom situations, and this analysis could be guided by a set of established criteria—or could result in such criteria. The publications mentioned above, Doyé (1991) and Byram (1993), are examples of studies that are mostly evaluative in this way. In such research, the motivation is pragmatic and the methodology is chosen to produce useable, defensible results typically in the immediate context.

Research for scientific purposes can raise a number of philosophical and methodological questions: How is the object of study constructed—is it the text itself, parts of the text, parts of the context of the text, and so forth? Does the analysis focus on cultural representations, on text genres, on discourses, on the role of textbooks in society? And is the philosophical foundation of the analysis characterized by positivism, hermeneutics, critical theory, social constructionism, or other perspectives? Most of the other references in this article have scientific purposes, although not all are equally explicit about purpose and philosophy.

Methodology should be evident from the documentation of the study, and here we can see a range of different methods developing: from quantitative content analysis encompassing the counting of words or topics in larger amounts of texts (e.g., Chapelle, 2009), to more qualitative discourse analysis of selected passages (e.g., Kramsch, 1988; Chapelle, 2010) and impressionistic readings of textbooks (e.g., Risager, 1991).

Another example of a quantitative study is Dechert and Kastner's (1989) investigation of the interests of students of German (in the USA) and the actual cultural content of textbooks for German. They established a predefined list of 99 potential cultural topics

and asked 286 students at the first four semesters of German to fill out a questionnaire concerning their amount of interest in these topics. The results were then compared to the actual content of 10 textbooks, and in the discussion the authors emphasize that textbooks should reflect both students' interests and teachers' (textbook writers') views of what the students need to know. A study of teachers in Denmark and England, including their attitudes to and evaluation of the cultural content of textbooks, was undertaken both quantitatively and qualitatively by Byram and Risager (1999). Sercu (2005), with a group of teachers and researchers, conducted a cross-European quantitative study of language teachers' beliefs regarding intercultural competence teaching, including their views on teaching materials, and Sercu's (2000) study of Belgian learners' perceptions of Germany and of the sociocultural content of their textbooks was also conducted using a quantitative methodology.

Another approach to research is the critical analysis of textbooks seen as products embedded in wider institutional, cultural, and political contexts. Kramsch (1988), for example, conducted an analysis of the foreign language textbook as a social genre and a cultural product in its own right, including discussions of the role of publishers, state departments, and teachers in addition to a microanalysis of a number of textbooks for German with emphasis on the multitude of voices in dialogues and readings. Zarate (1993) emphasizes that textbooks and language teaching in general are historically embedded and therefore sensitive to the fluctuations of geopolitical relations. Dendrinos (1992) approaches textbook analysis from the perspective of critical discourse analysis, focusing particularly on the ideological content of textbooks, on the authority of the textbook, and on pedagogical and political discourse in relation to the subject of English (see also Auerbach, 1995, for a critical discussion of the authority of the textbook in ESL, English as a second language).

Sercu (2000) contains an extensive discussion of qualitative and quantitative approaches to textbook analysis, which may be useful for framing future research investigating foreign language textbooks. To date, however, analysis of cultural content in textbooks remains a relatively underexplored field of study in spite of the potentially important role of textbooks for the development of cultural knowledge and intercultural competence. A strong rationale for cultural content of textbooks seems to be an important beginning point for ultimately developing a range of relevant materials and experiences for language students to learn about and experience culture in a manner that leads to intercultural competence.

Cummins, Jim

TOVE SKUTNABB-KANGAS

Professor James (Jim) Patrick Cummins (born July 3, 1949, in Dublin, Ireland) is one of the world's most influential researchers in bilingualism studies. His research has focused on various aspects of literacy development in multilingual school contexts, particularly the relationship between students' home languages (L1) and their developing proficiency in the dominant language(s) of instruction. He has also highlighted the interactions between societal power relations and teacher-students identity negotiation, arguing that only instruction that explicitly challenges coercive power relations in the wider society will be effective in promoting subordinated group students' academic achievement.

Jim Cummins grew up in Ireland and experienced firsthand through his schooling both immersion education and the challenges of reviving an endangered language (Irish). He started his studies at The National University of Ireland (psychology). After his PhD (1974, Alberta) he worked for two years in Dublin at the Educational Research Centre and then returned to Canada. Since 1978 he has been at the Modern Language Centre, OISE (Ontario Institute for Studies in Education), Toronto (see www.iteachilearn.org/cummins).

A prolific researcher and writer, Cummins has authored close to 20 books and edited an additional 11. He has also written almost 200 book chapters and more than 100 refereed journal articles. His work has focused on issues of policy and practice relating to the education of bilingual students and has been particularly influential in supporting the significant growth of bilingual and mother-tongue oriented multilingual education in countries around the world during the past 30 years.

Cummins's most influential work has involved the synthesis of apparently contradictory research findings and the articulation of theoretical constructs to resolve these contradictory findings. An early example is his 1976 paper "The Influence of Bilingualism on Cognitive Growth: A Synthesis of Research Findings and Explanatory Hypotheses." It hypothesized that the level of bilingual proficiency that students attained mediated the effects of bilingualism on their cognitive and academic development. Thus, the apparent contradiction between early studies (1920s to 1950s) reporting negative cognitive and academic consequences associated with bilingualism and more recent studies (1960s and 1970s) highlighting the potential cognitive benefits of bilingualism could be resolved by positing two thresholds of proficiency that students needed to attain (a) to avoid the negative effects associated with instruction through a weaker language, and (b) to experience the enhancement of cognitive and linguistic functioning that knowledge of two or more languages confers on the developing child. In other words, the threshold hypothesis (developed together with Pertti Toukomaa and Tove Skutnabb-Kangas) argued that educational treatment interacts with students' academic language proficiency to produce positive or negative educational and cognitive outcomes.

This theoretical work was expanded into the emerging debate on the merits or otherwise of bilingual education. Bilingual programs for minority group students, implemented on a limited scale in contexts such as the USA in the 1960s and 1970s, had become highly controversial. Opponents argued that dilution of the instructional time between minority students' L1 and the dominant language (L2) would inevitably result in deficient L2 academic development. In a widely cited paper published in the influential *Review of Educational Research* in 1979, Cummins drew on research carried out in Scandinavia, Canada, the USA,

The Encyclopedia of Applied Linguistics, Edited by Carol A. Chapelle.

DOI: 10.1002/9781405198431.wbeal0306

and elsewhere to propose the *interdependence hypothesis*. This hypothesis (also known as the *common underlying proficiency* [CUP] hypothesis) argued that literacy-related concepts and skills in L1 and L2 are interdependent, or manifestations of a common underlying proficiency, such that academic knowledge and skills transfer across languages under appropriate conditions of development (e.g., educational support for both languages). This transfer of concepts and literacy-related skills explains the fact that instruction through a minority language exerts no adverse consequences on students' academic development in the majority language despite less instructional exposure to the majority language. This holds true for students from both minority and majority language backgrounds in various kinds of bilingual programs.

In addition to work related to bilingual education during this period, Cummins also proposed a distinction between two dimensions of proficiency in a language—*basic interpersonal communicative skills* (BICS) and *cognitive academic language proficiency* (CALP). This distinction derived from an analysis of more than 400 teacher referral forms and psychological assessments carried out on students who were learning English as an additional language in a western Canadian city. It was clear from the data that students quickly gained conversational fluency in English but took considerably longer to catch up to grade expectations in academic aspects of language (e.g., vocabulary knowledge, reading comprehension). These data were consistent with previous research in Sweden that identified the "surface fluency" developed by Finnish minority group students in Swedish (their L2) (Skutnabb-Kangas and Toukomaa, studies for UNESCO).

A subsequent reanalysis of data from the Toronto Board of Education (Cummins, 1981) showed that, on average, students required five to seven years to come within a half standard deviation of grade norms on measures of academic language. The distinction between BICS and CALP has exerted a major influence globally on issues such as the amount and duration of instructional support deemed appropriate for immigrant and second-generation students and also the use of inappropriate psychological tests with immigrant and minority group students. However, it also led to accusations by a number of researchers that the distinction constituted a "deficit" theory which attributed students' underachievement to "low CALP." This interpretation was vigorously repudiated by Cummins (see Cummins, 2000, chap. 4, for the most complete discussion).

Although Cummins consistently acknowledged the central role of broader societal factors in determining students' academic development, his early focus was on psycholinguistic and psycho-educational considerations related to bilingualism and bilingual education. This focus shifted in the early 1980s partly in response to the misinterpretation of the construct of CALP but also because of the vehement rejection of bilingual education by media commentators and many policy makers in the USA. This rejection was clearly ideological in view of the fact that the research evidence was very clear: bilingual education represented a legitimate policy option with the potential to reverse patterns of minority group underachievement.

Cummins's 1986 paper "Empowering Minority Students," initially published in *Harvard Educational Review* and expanded upon in subsequent publications (e.g., his 1996 and 2001 [2nd edition] book *Negotiating Identities: Education for Empowerment in a Diverse Society*). This body of work integrated the previous psycholinguistic analyses and theoretical constructs into a broader framework that linked identity negotiation between teachers and students in the classroom to patterns of power relations in the broader society. Cummins distinguished between coercive and collaborative relations of power which correspond to the common distinction between "power over" and "power with." The former was defined as the exercise of power by a dominant individual, group, or country to the detriment of a subordinated individual, group, or country. This process is subtractive—the more power one player gets, the less is left for others. By contrast, collaborative relations of power are additive—the more power that accrues to one partner in the relationship, the more is

available for others to share. Based on this distinction, Cummins defined *empowerment* as *the collaborative generation of power*. The implication of this analysis is that any educational reform that seeks to close the achievement gap between dominant and subordinated group students will only be effective to the extent that it challenges the operation of coercive relations of power within the school and classroom, and, ultimately, the whole society.

Cummins's recent work has involved collaboration with educators aimed at creating interpersonal spaces in schools and classrooms that generate power for minority group students. For example, within the context of English-medium instruction, educators have implemented bilingual instructional strategies such as encouraging students to create and web-publish dual language books (in L1 and English) (see www.multiliteracies.ca). These *identity texts* hold a mirror up to students in which their identities are reflected back in a positive light, a very different message from the messages that schools have typically communicated to subordinated group students and their communities (see Cummins, 2009, for a summary of his recent work).

Summing up, comparing languages competence and school achievement of English mother-tongue children in French immersion programs, and (other) immigrant and other minority children (and later also indigenous/first nations children) in English-medium submersion programs made Cummins realize how differently the educational systems treated them, and how minority children were unfairly tested and labeled as deficient in terms of their capacities, background, and environment. This led Cummins to create *theoretical concepts*, today known and used everywhere in the world. He has continued to refine the concepts, to revise ways to test their validity and reliability (often working in schools, with children and educators, in many parts of the world), to relate them to school-internal and societal unequal power relations, to develop alternatives together with educators in schools. Cummins continues to educate teachers, school authorities, parents, politicians, and colleagues all over the world about the consequences of the unfair educational treatment of children. His work has deeply influenced hundreds of thousands of educators all over the world, and, through them, millions of children.

Curriculum Development in Multilingual Schools

CAROL BENSON

This entry describes contexts calling for multilingual schools, presents agreed principles of language and literacy learning, discusses international approaches to developing appropriate curricula, and indicates new directions in the field. Multilingual schools are defined here as schools serving learners who speak or will learn to speak—as well as develop reading and writing proficiency in—two or more languages.

Schools serving linguistically diverse groups of learners are often considered multilingual, and creative approaches have emerged to support and develop learners' home languages in such contexts. For example, rather than expecting individual teachers to be multilingual, teachers proficient in each relevant language may collaborate (Coltrane, 2002), IT and translation programs may be used (García, 2009), or classrooms may be organized by home language rather than by grade (Kosonen, 2006). While many of the same principles of language learning apply to these schools, the focus here is on multilingual programs that "exert educational effort" to promote communicative competence, literacy, and thinking skills in two or more languages (García, Skutnabb-Kangas, & Torres-Guzmán, 2006, p. 14).

Multilingual Schools for Whom?

Internationally, there are two common situations calling for multilingual schools. Situation A occurs in countries with one or more national languages—hereafter known as *dominant languages* (DLs)—serving learners from communities speaking regional, immigrant, or other minority languages—hereafter known as *nondominant languages* (NDLs); these terms were developed in collaboration with Kimmo Kosonen (see e.g., Benson & Kosonen, 2010). Examples are speakers of Navajo or Spanish in the United States, Breton or Arabic in France, Sámi or Somali in Sweden. Multilingual schools for these learners incorporate and sometimes develop their home or heritage languages while facilitating learning of one or more national DLs like English, French, or Swedish in the cases just mentioned. In Europe, such learners are often expected to learn an additional DL, giving them a repertoire of at least three languages; this is known as the "1 + 2" formula (European Commission, 2005; Baetens Beardsmore, 2009). It should be noted that in some situation A communities, multilingual schools are used to revitalize languages that have lost ground to DLs among younger generations.

Situation B occurs in countries characterized by societal bi- or multilingualism, where large majorities speak NDLs at home, acquire a lingua franca or language of wider communication outside the home, and must learn official DLs at school or in other formal domains. Countries like Nigeria (Bamgbose, 2000) and India (Jhingran, 2009), for example, have histories of curriculum development based on a three-language formula. Latin American and Asian societies are often bilingual, for example Quechua/Spanish in Bolivia or Hmong/Vietnamese in Vietnam, but schools may become multilingual with increasing public pressure to add "global" languages such as English to existing repertoires. Even for learners who speak DLs at home, policies have been adopted by situation B countries

such as Bolivia and South Africa to encourage the learning of local NDLs and thus improve mutual understanding, but it has not been easy to overcome learners' neglect of NDLs in favor of "global" languages (Alexander, 2003; López, 2006).

Multilingual schools are increasingly requested in situations other than A or B, for example as enrichment programs in relatively monolingual contexts where access to additional languages and cultures is perceived to bring about cognitive, social, or occupational benefits. Language learning and cognition are clearly linked, and learners' metalinguistic awareness, or understanding of explicit properties of language (Bialystock, 2001), is thought to help them to learn additional languages as well as to think critically and flexibly. The Council of Europe (Language Policy Division, 2006) differentiates between the *multilingualism* of societies or schools and the *plurilingualism* of the individual, referring to the development of communicative competence in multiple languages over one's lifetime according to one's needs, and promotes mass plurilingualism as a means for achieving democratic citizenship, pluralist attitudes, social coherence and mutual understanding.

Multilingualism, Multiculturalism, and Multiliteracy as Curricular Aims

Because the field of bilingual education was originally designed to help speakers of NDLs to learn and use DLs, its extrapolation into multilingual contexts and practices has required a number of adaptations. Certain principles of language and literacy learning have enjoyed continued research support, while others have been held up to scrutiny. Perhaps the most important principle, particularly for speakers of NDLs, is that initial and continued literacy taught in the learner's home language (L1) provides the best platform for learning academic content as well as additional languages, while building up the learner's identity and self-esteem (Cummins, 2009). Known as "first language first" in some parts of the world (UNESCO, 2005), this principle is equally valid when applied to strengthening the learner's "first culture" and identity, even if the heritage language is not necessarily the strongest in the learner's repertoire, and even if the learner has more than one home language.

Another principle common to bilingual programs is to teach the second or foreign language (L2) orally for the first few years of school, after which learners begin to transfer literacy and learning skills across languages, a process that can be facilitated by explicit comparison and contrast of relevant aspects of the languages in question (Cummins, 2009). There is strong evidence that transfer occurs whether or not the languages are linguistically related (Cenoz, 2009) and whether or not they use the same writing system (Kenner, 2004); in addition, transfer is multidirectional, meaning that all of the learners' languages contribute to their linguistic and cognitive development (Bialystock, 2001). The traditional sequential approach (L1-to-L2), as well as the strict separation of languages which characterized the bilingual curriculum, have been challenged with the incorporation of multiple languages and literacies into the classroom (Cenoz & Genesee, 1998; Hoffmann & Ytsma, 2003). Now the most effective approaches are simultaneously additive (Baker, 2006) and dynamic (García, 2009), as they aim not only to build on the learner's strongest language(s) but also to work multidirectionally on the entire linguistic repertoire to achieve multilingualism and multiliteracies.

New conceptions of literacy have gone far beyond the acquisition of reading and writing skills in multiple languages. *Multiliteracies pedagogy* builds on the rich cultural and linguistic identities that learners bring to the classroom, exposing them to a range of new communicative modalities like information technologies and helping them gain critical insights into how knowledge and society are constructed (New London Group, 1996; Cummins, 2009). *Critical literacy* calls into question the dominance or nondominance of

languages in society and is integrally linked to *multiculturalism*, which involves respect for all languages, cultures, and people, and intercultural awareness. *Interculturalism*, the ability to mediate between languages, cultures, and peoples, has long been recognized as a feature of Latin American bilingual programs, and more recently has been operationalized to emphasize indigenous knowledge and values while challenging existing inequities between groups (López, 2006).

A final principle that applies as much to multilingual as to bilingual curricula is that instruction in an additional language as a subject is probably insufficient to prepare learners for using that language as a medium of instruction. The school curriculum is an important source of language development because it is cognitively demanding (Gibbons, 2002), but this implies that teachers must be able to scaffold meaning. Scaffolding involves such strategies as activating prior knowledge, giving learners structures or terms to use, and encouraging use of the L1 to process information, the latter resulting in higher-quality L2 or L3 output than if only that language is allowed (Cummins, 2009; Swain & Lapkin, 2005).

Promising Directions in Multilingual Curriculum Development

Based on the above principles and aims, a well-designed multilingual curriculum is likely to include the following components.

- A holistic language program that develops and assesses multilingual competencies, promoting metalinguistic awareness and multidirectional transfer.
- Content area instruction that draws on and develops languages purposefully across the curriculum while maintaining an appropriate level of cognitive challenge.
- Inter- and multicultural awareness activities that are emancipatory and strengthen learner identity, such as research projects that involve family and community members.

One such holistic language program has been adopted by the Ikastolas (Basque-medium schools) in the Basque Autonomous Region of Spain to work systematically with four languages: Basque L1, Spanish L2, English L3, and French L4. Its integrated language curriculum uses the L1 as the main language of communication and learning but gives appropriate roles to the other languages depending on their presence in the learners' environment outside school, the linguistic distance between languages, and the level of learners' cognitive development at each level of schooling (Elorza & Muñoa, 2008, p. 92). The curriculum begins with a set of common general competencies, recognizing that they can be learned in different languages, or that some—like metalinguistic awareness—can be developed during the process of multilingual learning. The curriculum includes language-specific aims for oral and written competencies that differ based on multilinguals' needs in their societies. Based on these differing aims, evaluation criteria are developed and decisions made regarding which languages are introduced at what point in the curriculum, and how much time will be given to teaching them.

Such holistic language programs require new forms of language-enhancing classroom interaction that maximize learners' and teachers' linguistic resources. One such form is translanguaging, where multiple languages and discourse styles are engaged to negotiate meaning and affirm identity (García, 2009); for example, learners may read a text in one language, collaborate through another language to assemble the main points, and use yet another language for classroom discussion. Another form is transliteration, where learners of literacy may be encouraged to use the script of one language to write another, thus developing their metalinguistic capacities through written communication (Kenner, Gregory,

Ruby, & Al-Azami, 2008). Multimodal communication is also gaining attention, as teachers become more aware of the multitude of communicative forms that can be tapped for learning, including visual, iconic, musical, linguistic, and textual forms, which are just as applicable among minority youth in the USA (Harklau, 2003) as they are among Kashinawá teachers in Brazil, whose geometric *kene* patterns and figurative *dami* drawings nuance the meanings conveyed by written words (Menezes de Souza, 2005).

Teaching languages across the curriculum requires systematic planning of which languages will be used, how meaning will be supported, which aspects of language will be developed, and how understanding will be assessed. In Europe, *content and language integrated learning* (CLIL) exposes learners to meaningful language in content domains by working at realistic proficiency levels (Marsh, 2002). In low-income situation B contexts, a similar approach is taken using bi- or multilingual content materials to support teachers, students, and parents with the terminology and language structures they need to discuss content in the relevant languages (Malone, 2003; Mbude-Shale, Wababa, & Plüddemann, 2004). Assessment can also be bi- or multilingual by presenting questions in both or all languages and allowing learners to choose the language in which they respond, or by presenting different questions in different languages depending on the level of language production required. Such strategies are not unlike those of the European Schools (Baetens Beardsmore, 2009) or of multilingual immersion programs (Fortune & Tedick, 2008) where the integration of language and content maximizes exposure to all languages, and the integration of languages with each other “can soften the boundaries and probably foster the benefits of multilingualism” (Cenoz, 2009, p. 127).

There is need for advancement in the areas of multilingual assessment and multilingual teacher preparation. While the Common European Framework of Reference (Council of Europe, 2002) is useful for identifying different levels of language proficiency based on descriptors, the challenge is to go beyond the assessment of individual languages to fully recognize and describe multilingual communicative and multiliteracies competencies. Similarly, teacher development programs need to go beyond preparation for teaching individual languages to providing all teachers with multilingual competencies along with the knowledge and strategies for cultivating the same in their students.

Cut Scores on Language Tests

JAMES DEAN BROWN

Cut Scores and Standard Setting

A frequent question raised by test developers and users is what the cut scores should be for deciding who passes and who fails a new test. What should the standards be for passing, who should decide, and how can the fairness of the decision be demonstrated? These questions are raised because test users want to identify methods of making such decisions that do not appear arbitrary, but setting cut scores can be somewhat arbitrary. For example, in 1986, when I was director of the English Language Institute (ELI) at the University of Hawai'i, I arbitrarily decided that the cut scores for the ELI placement tests would be 50 and 60 (in *t* scores based on the fall 1986 administration of our placement test) for our listening, reading, and writing placement decisions. This meant that students who scored 49 or below on the listening tests would be placed into our intermediate-level listening course, those between 50 and 59 would be placed in the advanced course, and those scoring 60 or above would be exempt. The same cut scores were used for the listening, reading, and writing tests/courses. My reasoning was that I wanted to establish cut scores and then anchor them in that 1986 administration so that the ability levels of the students placed in each level would stay the same thenceforth.

Strictly speaking, nonetheless, the cut scores were arbitrarily assigned. Is that necessarily bad? Teachers make just such arbitrary decisions based on cut scores all the time when they use the following "traditional" grading scheme: 90% or above = a grade of *A*, 80–89% = *B*, 70–79% = *C*, 60–69% = *D*, and 59% or below = *F*. These cut scores are used for grading millions of students in classrooms across the United States, and such cut scores are widely accepted, yet they are arbitrary and not always fair—a fact that teachers admit when they use strategies like "changing the curve," adding 10% points to everybody's score, etc. In other words, there is some arbitrariness inherent in setting cut scores even when teachers draw upon traditionally accepted standards. When language-test users and developers want to set new cut scores or revisit existing ones, they draw upon professional practices to undertake a standard-setting process.

What Steps Are Involved in Standard Setting?

A number of options exist for standard setting, but the basic steps used in typical standard-setting methods (SSM) are as follows:

1. Choose an SSM (one that is easy to implement and compute, and that is easy to interpret and credible to lay people).
2. Choose judges or groups of judges who have a stake in the decisions being made (e.g., teachers, administrators, etc.).
3. Clearly describe all performance categories and candidate groups so that they will be suitable for making unambiguous judgments.
4. Train judges to use the SSM.

2 CUT SCORES ON LANGUAGE TESTS

- 5. Have judges rate test items, rubrics, candidates, candidates’ work and score profiles (depending on the SSM being used), while minimizing the social effects of interactions between judges and keeping them focused on whatever data are involved.
- 6. Give feedback and discuss as appropriate (if judges will be allowed to change their ratings based on the discussion, they should do so independently).
- 7. Assemble the ratings and calculate or create cut score(s).
- 8. Have judges evaluate the standard-setting process.
- 9. Assemble validity evidence.
- 10. Report the results.

Note that some SSMs skip one or two of these 10 steps, while others add a step here or there, but most SSMs follow this general pattern (see Table 1 for an example of the actual steps involved in the Jaeger, 1982, 1989, SSM).

Table 1 Example of steps in the Jaeger (1982, 1989) SSM

1.	Sample judges from all groups of stakeholders with an interest in the testing decisions.
2.	Get judges to examine all items and decide (<i>yes</i> or <i>no</i> for each item) if students who pass the test should be able to correctly answer the item.
3.	Share real student performance test data with the judges as well as the answers of the other judges.
4.	Get the judges to once again decide (<i>yes</i> or <i>no</i> for each item) if students who pass the test should be able to correctly answer the item.
5.	Calculate the standard for each judge by adding up the number of <i>yes</i> answers.
6.	Determine the standard for each group of stakeholders by finding the median across judges in the group.
7.	Decide the overall standard by using the lowest of the medians for all groups of judges as the passing score.
8.	Report the results.

Options for Standard Setting

Over the years, numerous strategies have been proposed for mitigating the arbitrariness of standard setting (for a detailed overview of these strategies, see Hambleton & Pitoniak, 2006).

Along the line, researchers began to notice that standard-setting strategies can be classified into different categories. For instance, Berk (1986, pp. 139–40) examined 38 different SSMs and proposed that they fall into four categories: state (i.e., mastery/competency is viewed as either 0% or 100%); continuum (i.e., mastery/competency is viewed as continuously distributed); judgmental (i.e., mastery/competency is decided by one or more judges, independently of data); or judgmental-empirical (i.e., mastery/competency is decided by one or more judges based on data). Jaeger (1989, pp. 492–500) discussed state models, but argued that, for most practical situations, continuum models should be applied. He further proposed that continuum models should be divided into test-centered methods (i.e., those setting standards based primarily on test characteristics) and examinee-centered methods (i.e., those setting standards based primarily on examinee characteristics). In discussing the development of new SSMs, Hambleton, Jaeger, Plake, and Mills (2000) saw a need to further subdivide the test-centered methods and examinee-centered methods into four categories: (a) test items and scoring rubrics, (b) candidates, (c) candidate work, and (d) score profiles. Table 2 shows most of the main SSMs categorized into these four categories.

Table 2 Prominent SSMs in the literature

<i>Categories of SSMs</i> <i>Specific methods</i>	<i>Useful references for SSM</i>
<i>SSMs involving review of test items and scoring rubrics</i>	
Anghoff method	Anghoff (1971); Ferdous & Plake (2007)
Borderline examinee method	Hambleton & Plake (1995); Fowell, Fewtrell, & McLaughlin (2008)
Analytic method	Pitoniak, Hambleton, & Biskin (2003)
Ebel method	Ebel (1972); Fowell, Fewtrell, & McLaughlin (2008)
Nedelsky (1954) method	Nedelsky (1954)
Jaeger method	Jaeger (1982, 1989)
Item-mapping method	Hambleton, Swaminathan, & Rogers (1991)
Bookmark method	Karantonis & Sireci (2006)
Direct consensus method	Sireci, Hambleton, Huff, & Jodoin (2000)
<i>SSMs involving review of candidates</i>	
Borderline group method	Schoon & Smith (1996); Searle (2000)
Contrasting groups method	Livingston & Zieky (1982)
<i>SSMs involving review of candidate work</i>	
Item-by-item method	Loomis & Bourque (2001)
Body of work method	Kingston, Kahl, Sweeney, & Bay (2001)
Booklet classification method	Loomis & Bourque (2001)
Generalized examinee-centered method	Cohen, Kane, & Crooks (1999)
Analytic judgment method	Plake & Hambleton (2001)
Integrated judgment method	Jaeger & Mills (2001)
Work classification method	Pitoniak, Hambleton, & Biskin (2003)
<i>SSMs involving review of score profiles</i>	
Judgmental policy capturing method	Jaeger (1995a, 1995b)
Dominant profile method	Plake, Hambleton, & Jaeger (1997)
Item cluster method	Mills, Hambleton, Biskin, Kobrin, Evans, & Pfeffer (2000)

Standard Setting and Error

The standard-setting process provides a basis for setting cut scores. However, as in all human activities, decisions made on cut scores are error prone, especially near any given cut score. Clearly, the decisions made for examinees who are well below or above a given cut score are probably accurate. However, a problem arises for examinees near the cut score because scores are never 100% reliable, and examinees who are close to a cut score could conceivably end up on the other side of the cut score by chance alone if they were to take the test again. Fortunately, there are statistics that can help us estimate the unreliability of scores around a cut score in useful terms. The standard error of measurement (SEM) is one such statistic that can be applied if the test is norm-referenced. The SEM indicates the degree to which scores are likely to fluctuate around a cut score because of unreliable variance. For example, an SEM of 2.10 on a placement test indicates that examinees' scores would fluctuate ± 2.10 points with 68% probability if they were to take the placement test repeatedly. In other words, with a cut point of 25, the SEM of ± 2.10 points indicates that examinees who have scores between 22.90 ($25 - 2.10 = 22.90$) and 27.10 ($25 + 2.10 = 27.10$) are likely to fluctuate within that range 68% of the time, and therefore could conceivably end up on the other side of the cut point if they were to take

the test again. Indeed, students within the band of scores between 22.90 and 27.10 might well be misplaced—a fact that is far less likely for students further from the cut point.

Typically, the strategy that is used for making decisions in such cases is to identify students within the band of error (in this case, ± 1 SEM) of the cut point and gather additional information about them (e.g., a writing sample, an interview, feedback from previous teachers, etc.) to help make the decisions about them more reliable. In short, the SEM provides information that helps to identify examinees who might be categorized incorrectly because of measurement errors in norm-referenced scores so that additional data can be gathered about them that will help to make decisions about them more reliable. An analogous statistic exists for estimating the errors on criterion-referenced tests in terms of their dependability: the confidence interval (or CI). (For more information on both the SEM and CI, including how to calculate them, see Brown, 2005, pp. 188–90, p. 210, pp. 214–15; Brown & Hudson, 2002, pp. 167–8, pp. 184–7.)

Cut Scores and Reliability or Dependability

Another statistic that is useful in relation to cut scores is the $\phi(\lambda)$, or $\Phi(\lambda)$. Because the degree of consistency (reliability for norm-referenced tests, or dependability for criterion-referenced tests) of test scores varies depending on where the cut scores are found in the score range, language testers may find it useful to examine the reliability or dependability of scores at various cut scores before using the cut scores for decision making. $\Phi(\lambda)$ provides an estimate of the degree of score consistency for decisions made with a particular cut score, while taking into account the distances of the scores from the cut score. Thus, language testers may find the $\Phi(\lambda)$ useful in two ways: (a) for determining the reliability or dependability of test scores at various cut scores to help them decide where a cut score should be placed, and (b) for estimating the reliability or dependability of an established cut score as part of a decision-validity study. (For more information on $\Phi(\lambda)$, including how to calculate it, see Brown, 2005, pp. 211–15 and 2007, pp. 17–18; Brown & Hudson, 2002, pp. 195–8.)

Cyberpragmatics

FRANCISCO YUS

“Cyberpragmatics” was coined by Yus (2001, 2010a) as an attempt to study Internet-mediated communication (IMC) from a cognitive pragmatics point of view and, more specifically, from the theoretical framework of *relevance theory* (Sperber & Wilson, 1995), although other theoretical approaches were also addressed when appropriate.

Relevance theory claims that our cognition is biologically geared to the maximization of relevance from the different inputs that reach our minds. Since we cannot possibly pay attention to all the barrage of information that we can process in a specific context, human beings have developed an ability to filter out potentially irrelevant information and to focus their cognitive resources on what might provide informational reward. This biologically rooted ability is covered by the so-called *Cognitive Principle of Relevance*: “Human cognition tends to be geared to the maximization of relevance.” However, the main focus of relevance theory is verbal communication. As soon as people speak to us, their utterances create expectations of relevance, and this is covered by the *Communicative Principle of Relevance*: “Every act of overt communication conveys a presumption of its own optimal relevance.”

Crucially, aiming at optimal relevance when interpreting the speaker’s utterance involves weighing up the likelihood of several interpretations, all of which are compatible with the utterance that has been coded. For an interpretation to be selected as the most relevant one, it has to be the interpretation that provides the best balance between two conditions:

- Condition (a): An assumption is relevant to an individual to the extent that the positive cognitive effects achieved when it is optimally processed are large.
- Condition (b): An assumption is relevant to an individual to the extent that the effort required to achieve these positive cognitive effects is small.

The picture is not one of dismissing any interpretation that is more effort-demanding than others. In reality, and also in IMC, we are often ready to expend additional mental effort if we obtain some supplementary reward (cognitive effects) in exchange. One of the aims of cyberpragmatics is to analyze why Internet users often find relevance in text-based communication even though several options of contextualization (Webcam, microphone) are available. It also analyzes how users fill the gap between what is coded and what is interpreted, and the role of technological aspects of IMC in the eventual assessment of relevance (cognitive effects vs. processing effort, as mentioned above). Besides, in Yus (2011) several relevance equations of effective Internet communication are commented upon in which a number of non-propositional *cognitive rewards* are proposed that the user may find when engaging in IMC (feelings of empathy, of connectedness, of identity shaping, etc.) and might produce supplementary effects. These were contrasted to a number of *environmental constraints* that may also play a role in the eventual assessment of relevance in IMC (familiarity with software; usability of the interface; type of navigation that the user is currently engaged in; current position—typically changing—of the medium in the scales of oral–written, visual–verbal, and synchronous–asynchronous; etc.).

2 CYBERPRAGMATICS

Specifically, several aspects are stressed and addressed by cyberpragmatics:

- a In IMC, just as in face-to-face (F2F) communication, the *addresser users* have communicative intentions and have to devise their messages in such a way that the intended interpretation is selected by their *addressee users*.
- b Internet users resort to inferential strategies when interpreting messages on the Net, but these do not differ from the ones that they use in the interpretation of utterances in F2F communication with physical co-presence. There is only one biologically rooted ability to turn words into relevant interpretations, regardless of the type of utterance, the channel used, and the richness of contextual information.
- c *Addresser users* expect their virtual interlocutors to access some specific contextual information that enables them to reach the intended interpretation of their messages. Similarly, *addressee users* invariably access contextual information as an inherent part of their relevance-seeking inferential activity.
- d An important claim in cyberpragmatics is that the characteristics of the different applications for Internet communication (chatrooms, Messenger, e-mail, Web pages, etc.) affect the quality and quantity of contextual information accessed by users, the mental effort devoted to interpretation, and the choice of an interpretation. Indeed, cyberpragmatics analyzes communicative exchanges that take place in all forms of IMC and what we can label their “material qualities” (basically their position on the verbal–visual and oral–written scales in terms of options for contextualization) will have an impact on the balance of cognitive effects (i.e., interest) and mental effort obtained during the relevance-seeking interpretation.
- e There is a link between relevance and the interfaces of programs for IMC. The non-expert users who face problems in surfing the Net, using the applications, and so forth will face supplementary mental effort even before interactions with other users or the processing of documents from Web pages start. Expert users, on the contrary, will obtain the highest reward from the Internet without the burden of technology-related effort (Yus, 2003).
- f Much of cyberpragmatic research focuses on the users’ ability to connote their messages with different attributes of orality, typically found in the vocal (e.g., repetition of letters and creative use of punctuation marks) and the visual (e.g., emoticons) channels of oral interactions (see Bays, 2008, among others). Therefore, cyberpragmatics analyzes the challenges that users face when they attempt to compensate for this lack of orality. And very often more effort has to be devoted to tracking down underlying intentions, feelings, and emotions conveyed by text-based utterances (Yus, 2005).

In this sense, all the forms of IMC can be arranged on a *scale of contextualization* ranging from those with a high level of contextual support (video conference, Internet-mediated telephone, Webcam-mediated chatrooms, etc.) at one end to plain text-based communication at the other. In any case, there is always an informational gap between what is typed (i.e., coded) and what is interpreted, regardless of the level of contextual support. This accords with the so-called *underdeterminacy thesis* (Carston, 2002), which predicts gaps between what the speaker says and what the speaker intends to communicate, and also between what the speaker says and what the hearer interprets.

Needless to say, this filling of the gaps is made easier if the channel of communication is capable of providing a lot of contextual support, especially concerning visual and oral nonverbal information typically communicated in parallel with verbal utterances. If communication on the Net relies only on typed text, several additional informational gaps are generated that have to be filled inferentially.

Undoubtedly, users devise different strategies to *oralize* their messages and texts in order to make them richer in terms of contextualization, and cyberpragmatics also

addresses these strategies. For instance, in Yus (2005), it was concluded that what was labeled *textual deformation* (repetition of letters, creative use of punctuation marks, emoticons, etc.) aids in the communication of attitudes, feelings, and emotions in chatrooms. However, and not as predicted, addressee users failed to infer degrees in the intensity of these attitudes, feelings, and emotions related to the amount of text typed by the addresser user. This *textual deformation* seems to work as an “either/or strategy”; that is, if there is textual deformation more intensity is inferred, but different amounts of textual deformation do not lead to inferred degrees of intensity. Nevertheless, chatrooms offer great opportunities for language teaching. For instance, Demirbilek and Mutlu (2010) study chatrooms as purposeful communication that leads to increased language production and social interaction and, at the same time, promotes higher-order thinking skills, and hence offers nice opportunities for teaching.

- g The assessment of relevance when interpreting IMC can also be altered by the qualities of the program interface (Yus, 2008, in press), often by gratuitously increasing the users’ mental effort, since very often they have to devote supplementary cognitive resources to using that interface, besides the effort of selecting an interpretation. However, today’s adolescents, typically “digital natives,” are used to engaging in multitasking and in multithread conversations (Baron, 2008). For example, it is common to have several Messenger windows open simultaneously, and therefore this apparent constraint should pose no additional mental problem.
- h An interesting focus of cyberpragmatic research concerns how advances in the level of contextualization provided by the interface (e.g., Webcam added to the instant messenger) generate (or not) better balances of cognitive effects and mental effort in the user’s search for relevance. On paper, these improved interfaces should aid IMC by reducing the effort related to the use of the interface and by aiding in the correct choice of interpretations, but this is not always the case. For instance, avatar-mediated communication (e.g., Second Life) is supposed to be a richer medium of communication, but the effort demanded to control the avatar’s nonverbal behavior may not be offset by the number of cognitive effects obtained in return. At the same time, though, in Second Life users can type their messages or use the audio facility (the latter being an increased level of oralization and hence of contextualization).
- i Cyberpragmatics also analyzes the interpretation of discourses that have been exported to the Internet (especially from a printed format to an electronic one), and how the new medium generates alterations in the users’ assessment of relevance and also in the decisions concerning how much information is conveyed and how it is organized and offered to the user. This is the case of newspapers and advertising, both of which exhibit new formats and ways of presenting information adapted to the requirements of the screen and to the level of context accessibility that the new reader/user can access compared to the reader of the printed version. For an application to second language (L2) teaching, see Tremayne (2008).
- j Another area of research within cyberpragmatics concerns the social side of IMC, especially the way IMC is used to sustain and assess group membership and (personal) social networks (Yus, 2007). A growing number of social uses of the Internet are centered upon language as part of the effort to keep a profile in a Weblog or in a social networking site, to inform people of daily activities via Twitter, to use content generated in collective achievements such as Wikipedia, to manage virtual communities, and so forth. In these cases, the “social benefit” obtained from these forms of IMC offsets the effort required to keep this level of commitment to the other users.

Weblogs and social networking sites, as well as micro-blogging services such as Twitter, satisfy the user’s individual and social communicative needs and provide interesting insights into how optimal relevance may be obtained not only in the

interpretation of messages but also in group-related assumptions and mutual network awareness. Profiles in social networking sites such as MySpace or Facebook are an excellent way of monitoring one's personal and social identities in terms of number of contacts, access to personal news items, and embedded instant messaging services. This is why they have become so popular in the last few years, in both everyday and L2-centered interactions.

- k At the same time, one of the social qualities of the Internet involves discourses created by users for other users, the so-called Web 2.0, or the trend to user-generated content (as in Wikipedia). In terms of relevance, the proliferation of texts may be detrimental to the users' assessment of relevance. To start with, the high quantity of available information may alter the user's willingness and ability to filter it and process it in an efficient way. Besides, information on the Internet is often not structured in a hierarchical way, in the sense that there is no "authority" backing up the relevance and trustworthiness of what is about to be read (by filtering the potentially irrelevant information, trusting the source, etc.), and therefore the effort devoted to processing such information may be too high.
- l Finally, illicit or nonlegal (or simply annoying) uses of the Net may also alter the user's estimation of relevance by uselessly increasing the effort to access the most relevant information. A clear example is the *spamming* of e-mails, which makes the reading of authentic and interesting messages utterly impossible (Freeman, 2009). This is frustrating for the users and a clear threat to an optimal balance of cognitive effects and mental effort. Similarly, so-called *pop-up advertisements* intrude on the user's current task, making the access to relevant information much harder. Finally, user-generated projects such as Wikipedia have been attacked by cyber-activists altering the content of its entries and hence lowering the users' level of trust in that site as a source of relevant information.

Davies, Alan

JOHN C. MAHER

Professor Alan Davies, a founding father and major theorist of the field of applied linguistics, is Emeritus Professor of Applied Linguistics at the University of Edinburgh. Davies grew up in South Wales of Welsh- and English-speaking parents. His early linguistic experience provided an awareness of the reality and paradoxes of multilingualism, power, and the politics of language. After taking a degree in English at the University of Oxford and seven years as an English teacher in the UK and Kenya, he developed the English Proficiency Test Battery (EPTB) for the British Council at the University of Birmingham, where he was awarded a PhD on “Proficiency in English as a Second Language” (1965). He was appointed to a lectureship at Edinburgh University in 1965, has taught at universities in Nepal and Hong Kong, and in 1991 became founding Director of the Language Testing Research Centre at the University of Melbourne. He served as editor of *Applied Linguistics* and *Language Testing*. He was chair of the British Association of Applied Linguistics, Secretary-General of AILA, and President of the International Language Testing Association (ILTA). He was in 2003 the first recipient of a Lifetime Achievement Award presented by the University of Cambridge Local Examinations Syndicate and ILTA. In 2006 he was awarded a Leverhulme Emeritus Fellowship for a study entitled *Native Speakers and Native Users*.

Davies has articulated a philosophy of applied linguistics as an independent and taxonomic discipline that aims to unify our experiential and theoretical understanding of language in use. His long career and substantive interests, articulated with sustained conceptual strength, span sociolinguistics, language acquisition, and language testing. Davies’ works most relevant in this regard are: *Principles of Language Testing* (1990), *Introduction to Applied Linguistics* (2nd edition, 2007), and *The Native Speaker: Myth and Reality* (2003). In the heterogeneity and depth of Davies’ work there are recurrent themes: the identity of applied linguistics in an interdisciplinary modern/postmodern world; the issue of idealization (*sic* abstraction) in language, especially in the debate on standard languages; the analysis of speech style and register; interlanguage and second language acquisition; and the central role of testing in applied linguistics. In the field of testing he has played a preeminent role in test development and theory as well in his insistence on the need for both a professional and humanistic orientation.

Applied linguistics, Davies suggests, is a “marriage of practical experience and theoretical understanding,” specifically a) multifactorial, drawing on other disciplines such as sociology, education, politics and psychology; and b) a theorizing rather than theoretical discipline that investigates, analyzes, and offers recommendation on language problems (2004, 2005). Davies argues, radically, that being a “force field of social imperatives about language that drives speculation and theory,” applied linguistics is an “unmarked form,” a precursor of the field of linguistics, not the other way round. Responding to a relativistic or postmodern critique of applied linguistics as merely a collaborative collection of themes about language rather than a discipline, Davies argues that though, like most disciplines, it is blurred at the edges, applied linguistics has a history, professional participants, and a body of theorizing practice that constitutes the essence of the field.

There are Firthian echoes in Davies’ approach to language: the notion that speech is not the “boundless chaos” that Samuel Johnson believed, but has lines and boundaries,

prescribed rituals and episodes. Thus, abstraction from what Firth called the “mush of general goings on” is necessary for the individual both as actor and as analyst. The language teacher, Davies argues, engages in such activity (i.e. the methodics of selection)—grading and organization of materials and syllabus—which always involves various forms of sampling. Likewise, the linguist can only look at some data in the language corpus. Davies has frequently drawn attention to the fact that language use in various domains, such as reading and writing, is a single, coordinated activity of “composite nature” and something the reader or speaker “is no more aware of than is the taxi driver of the composite nature of car-driving” (Davis & Widdowson, 1974, p. 155). His study of language in “relatively-determined-contexts” led to work on textbook situations and idealized language (1978), studies of specific speech events such as the “Davies family breakfast,” and culminated in the influential analysis of verbal interactions “Talking in silence” in Quaker meetings (1988).

In matters of language, Davies has invited applied linguists and language teachers to value irony and the elegant contradiction as much as the straightforward solution. This is evident in his contribution to the issue of language knowledge and the native speaker and the issue of standard languages. In an exhaustive and lapidary critique of the native speaker, Davies expounds a philosophy of language that hinges on the connectivity of applied linguistic analysis with various fields (psycholinguistic, literary, sociolinguistic) as it tries to account for the composite nature of our language operations but also on the paradox of language. He considers whether it is possible to become a native speaker of a language that is not your mother tongue and attempts an explanation of “the native speaker.” Loss of heritage languages and the spread of world Englishes raise doubts about identity, while recent empirical work in second language acquisition and in language assessment questions the conventional view of ultimate attainment. Davies argues that while a noticeable difference exists between “native” and “non-native,” the disparity noticeably affecting second language learning, it is still possible for a non-native speaker to become a native speaker. Davies argues that, with the exception of early language exposure, all characteristics of the native speaker are contingent. How far such contingent characteristics, such as grammatical intuitions, or creativity, can be acquired without substantive early exposure is difficult and rare. Thus the fundamental opposition between native and non-native, he concludes, is one of power: native speaker membership is determined by the non-native speaker’s willingness to assume confidence and identity. We recognize the weakness of even educated native speakers to gain control over the resources of standard (written) English in order to communicate meaning, but language teachers still need to prepare materials in standard English. Thus, teachers must be made aware of the ongoing debate about conventional norms and prescription. Cognitive research investigates the native speaker, paying no attention to variation among native speakers. Sociolinguistics emphasizes variation, but when it needs to describe the native speaker (rather than native speakers), it too must idealize. Paradoxically, therefore, the cognitive and the social meet in an idealization which operationalizes itself as the standard language, the goal for both first and second or foreign language learners, achieved for both through education.

The “unacknowledged idealization of sociolinguistics” (1984) arises also when linguists discuss standard languages. The standard language, though uncertain and fugitive, is the model for language learners: the native speaker as social fact is the standard language. Indian English, Singapore English, and so on exist, but in order to gain institutional acceptability they need the confidence of their speakers. The irony of world Englishes, Davies (1999) has argued, is that while the goal of education remains British or American English, most world English users employ a local world English variety in their daily lives. However, it does not have the prestige of an exonymic variety, which is what is typically institutionally selected. This impacts on language testing. A test is an institutional event that

requires a description on which to base itself. Until world English users have sufficient confidence in their codes to proceed to description and to institutional use, world Englishes are not assessable. Pointing to such ironies Davies (1996) has eschewed linguistic imperialism, the claims of which he has characterized as being not falsifiable (what if “the dominated” wanted to adopt English and continue to want to keep it?) The unfalsifiable answer must be that they do not, they cannot, they have been persuaded against their better interests, and also that two cultures inhabit linguistic imperialism: one, a culture of guilt (“colonies should never have happened”); the other, that of romantic despair (“we shouldn’t be doing what we are doing”).

Davies has consistently highlighted the unique role of language (proficiency) testing in applied linguistics (1968, 1977). An early legacy is his development of a British Council-sponsored test for the selection of overseas students for entry to UK higher education. The English Proficiency Test Battery (EPTB) was widely referred to as the ‘Davies’ test and it remains a primary indicator of the foundation of modern professional language assessment. He has pointed out that language testing not only provides a critique of syllabi, courses, methods, and materials, measures progress among learners, and enables the selection of students for another stage of education, but that testing provides hypotheses in relation to our understanding of language and language learning. In this aspect, Davies helped connect the conceptual lines between language testing and the interlanguage studies of his Edinburgh colleague Pit Corder (1984). Language assessment provides a triple message about skill, the extent to which learners have attained proficiency; about proficiency, indicating the psycholinguistic and psychological provenance of the learner; about knowledge, indicating how native speakers and non-native speakers distinguish themselves in terms of their awareness of language (2007, p. 86).

Davies has drawn attention to the increasing need for ethicality linked to the growth of professionalism and is the leading voice in the view that language testers have an ethical responsibility to ensure that tests are fair to both test takers and score users, reliable indicators of language abilities to be measured, and supportive of the interpretations and decisions regarding test performance. Davies was a leader in the efforts of the International Language Testing Association (ILTA) to establish a Code of Ethics for the profession, and chaired the ILTA committee that drafted a set of Guidelines for Practice for language testers. For Davies, the importance of ethics is that it asks good questions. More interested in questions than in answers, he does not accept the view that applied linguistics is about promoting change: for him, its purpose is to question why the world is at it is.

de Bot, Kees

WANDER LOWIE

Kees de Bot is Professor at the University of Groningen, the Netherlands, where he holds the chair in Applied Linguistics and is Vice Dean in the Faculty of Arts of the University of Groningen. He was born on March 11, 1951 in Rotterdam. He graduated from the University of Nijmegen in General Linguistics and Applied Linguistics (1977), where he also finished his PhD (1982). He became Chair of Applied Linguistics and head of department at the University of Nijmegen in 1994. In 2002 he was appointed Chair of Applied Linguistics at the University of Groningen, where in 2008 he became director of the research school for Behavioral and Cognitive Science. Since 2009 he has been the vice dean of the Faculty of Arts and director of the graduate school of the Humanities there.

Kees de Bot is a trustee of the TESOL International Research Foundation and a member of the Program Committee of the Department of Modern Languages of Carnegie Mellon University. He is coeditor of the series *Studies in Bilingualism* (SIBIL) published by John Benjamins. He has published many books and articles in applied linguistics on such topics as language attrition, psycholinguistics, language policy, and dynamic systems approaches to second language (L2) development. He has supervised numerous PhD projects and has organized a large number of workshops and conferences. Apart from his worldwide reputation as an eminent researcher in applied linguistics, many people consider Kees de Bot as a connoisseur of fine wines and good food. He has a broad interest in literature and is a keen runner and skier.

In his professional career, Kees de Bot has worked on a variety of issues related to second language development and multilingualism. His PhD research concerned the use of visualizations of intonation as a teaching aid for L2 pronunciation. Although he has maintained a great interest in this area, his major work since his PhD has focused on foreign language attrition, language learning and language teaching policy, the psycholinguistics of bilingual language processing, and, more recently, the application of dynamic systems theory in SLD (second language development) and multilingualism. In addition, he organized a successful international symposium on gestures and second language learning in Groningen in 2006, and more recently edited an important volume in this field, together with Marianne Gullberg (Gullberg & de Bot, 2010). In the mid-1980s a group of researchers in Nijmegen developed an interest in language attrition. Initiated by Kees de Bot, Bert Weltens, and Theo van Els, this research led to numerous well-known publications over more than 20 years (e.g., Weltens, de Bot, & van Els, 1986; Schmid & de Bot, 2003). This research described the process of language attrition as a linguistic phenomenon, in addition to the processes behind attrition. In contrast to the previous *linguistic* approaches to language attrition, the Nijmegen group linked the cognitive process of language attrition to social interaction in language shift, dialect death, and foreign language attrition. Actively working in this area since the mid-1980s, Kees de Bot is seen by many as “the only constant factor in this quickly changing field” (Schmid & Köpke, 2004).

The conviction that language should primarily be regarded in the context of social interaction, which marked his contribution in language attrition, is also evident in de Bot's work on language policy. He made important contributions to the discussions on the relevance of second language acquisition and on minority languages in the Dutch and

European contexts (e.g., de Bot & Gorter, 2005). In addition to his research into the nature and process of second language acquisition, de Bot has always emphasized the importance of the application of applied linguistic research to language teaching (de Bot, Ginsberg, & Kramsch, 1991; de Bot, 2007). Partly as a result of this, he has been involved in research into bilingual education (de Bot, 2000), and also in setting up and maintaining a system of quality control of bilingual secondary schools in the Netherlands (as an independent advisor of the European Platform). In addition, he contributed to the Common European Framework of Reference (de Bot & van Els, 2001) and its implementation into secondary and tertiary education in the Netherlands. His contribution to second language acquisition as a sociopolitical phenomenon is further evidenced in his work on language policy in bilingual societies (Bongaerts & de Bot, 1997; Berns & de Bot, 2005). In 2003 he organized a successful international workshop about sociopolitical aspects of language learning and teaching in Groningen.

Perhaps the best known of de Bot's work is his application of psycholinguistics to second language acquisition and multilingualism. This line of research was initially inspired by the proximity of Willem Levelt and his colleagues of the Max Planck Instituut in Nijmegen at the time of the publication of Levelt's seminal book, *Speaking* (Levelt, 1989) (see Weltens, 2011, in Suggested Readings below). The fact that this publication focused on speech production by monolinguals incited de Bot to propose his own bilingual speech model (de Bot, 1992). This adaptation of Levelt's model, including its reprints in handbooks, is one of de Bot's most frequently cited publications and is still often referred to today. Since then, the organization of the multilingual mental lexicon has been one of his profound interests and areas of expertise, and has led to a large number of publications on the subject (de Bot, 2004; de Bot & Lowie, 2010), also in relation to neuroimaging (de Bot, 2008a).

Most recently, Kees de Bot managed to combine all of the above insights into a new and comprehensive view of language development within the framework of dynamic systems theory (DST). Inspired by the developments in developmental psychology in Groningen at the onset of this century (Van Geert, 1998), and in the wake of Larsen-Freeman's work on complex systems (Larsen-Freeman, 1997), de Bot initiated a wide range of studies that took DST as a starting point (De Bot, Lowie, & Verspoor, 2005; De Bot, Verspoor, & Lowie, 2007; De Bot, 2008b; Verspoor, De Bot, & Lowie, 2011), and (co-)organized several workshops and symposia at conferences (e.g., at AAAL 2006 in Montreal; AILA 2008 in Essen; Anéla 2009 in Kerkrade; Innsbruck in 2010 and AILA 2011 in Beijing). De Bot and his colleagues showed that the most important characteristics of the application of DST to second language development are the focus on the process rather than products of development, and consequently the recognition of the relevance of within-learner variability as an indicator of development. The DST framework provides the vocabulary and the means to come to an understanding of empirical observations in subfields of applied linguistics that had thus far been very difficult to account for. For Kees de Bot, this framework provided a means to view language development (i.e., acquisition and attrition) as truly embedded in its social and psychological context.

In addition to his renowned research, Kees de Bot is also known as an excellent and very experienced teacher. In his teaching, he always manages to actively involve his students and is famous for his thought-provoking and often provocative questions. He is frequently invited to summer schools and winter schools (Landelijke Onderzoeksschool Taalkunde, LOT; Penn State) and was nominated for the Best Teacher of the Year award in Groningen in 2009.

In 2011, two of his former PhD students and now colleagues at the University of Groningen, Monika Schmid and Wander Lowie, edited a volume in honor of Kees de Bot for his 60th birthday (Schmid & Lowie, 2011). This volume contains contributions by key

figures in applied linguistics (Judith Krol, Susan Gass, Jan Hulstijn, Diane Larsen-Freeman, Lynne Hansen, Michael Clyne, Robert Schrauf, Bert Weltens, amongst others), reflecting the breadth of research carried out by Kees de Bot. In touching upon the range of de Bot's work, this book also provides a cross-section of research into applied linguistics between 1985 and 2010.

DeKeyser, Robert

PATRICK REBUSCHAT

Robert DeKeyser is a Belgian applied linguist who is best known for his influential research and publications on the cognitive aspects underlying second language acquisition (SLA) and teaching. DeKeyser's work covers a variety of topics, including implicit and explicit learning, the role of practice in second language (L2) acquisition, language learning in study-abroad settings, and age effects in L2 acquisition. The linguistic focus in DeKeyser's work is usually on the acquisition of L2 morphosyntax (see, e.g., DeKeyser, 1995, 1997, 1998, 2005a; Goldschneider & DeKeyser, 2001). His research has been funded by many grants, including highly competitive awards from the National Institutes of Health, the Spencer Foundation, and the United States Department of Education.

DeKeyser was born in Varsenare, Belgium, in 1957. He pursued his undergraduate studies at the Catholic University of Leuven, where he obtained a BA in Romance Philology (1979), a Diploma in Spanish Studies (1979), a Certificate of Specialization in Psycholinguistics (1980), and his teaching credentials (French, 1980). He then moved to the United States to study at Stanford University, where he first obtained an MA (1982) and then a PhD in Education, with a minor in Linguistics (1986). After his doctorate, DeKeyser returned to Belgium to work on a research project funded by the Belgian National Science Foundation, before returning to the United States in 1988 to take up a faculty position at the Department of Linguistics, University of Pittsburgh. He moved to the University of Maryland, College Park, in 2005, where he is currently professor of Second Language Acquisition.

DeKeyser has published a substantial number of widely cited studies in journals such as *Studies in Second Language Acquisition*, *Language Learning*, *Applied Psycholinguistics*, *TESOL Quarterly*, *Annual Review of Applied Linguistics*, *Modern Language Journal*, and *Language Testing*. He has contributed a large number of invited chapters to influential state-of-the-art volumes (e.g., Doughty & Williams, 1998; Robinson, 2001) and handbooks (e.g., Doughty & Long, 2003; Kroll & de Groot, 2005). DeKeyser's review articles have been particularly influential and represent the first—and sometimes the only—port of call for researchers and students interested in major topics in SLA, for example automaticity and automatization (DeKeyser, 2001), implicit and explicit learning (DeKeyser, 2003), age effects in L2 acquisition (DeKeyser & Larson-Hall, 2005; DeKeyser, in press), and skill acquisition theory (DeKeyser, 2007a). In addition to his article publications, DeKeyser also edited three influential volumes, *Practice in a second language* (DeKeyser, 2007b), *Morphosyntactic development in second language learning* (2005b), and *Testing second language acquisition theory in the lab* (Hulstijn & DeKeyser, 1997).

DeKeyser is also well known for his extensive service to the profession, especially in his role as editor of *Language Learning* (2005–10), one of the flagship journals in the field. He is on the advisory board of several book series and the co-editor of the *Studies in Bilingualism* series, published by John Benjamins. He has also served as external PhD examiner and external referee for promotion and tenure committees at many universities, and as ad hoc reviewer for funding bodies.

Topics and Ideas

Age Effects in Second Language Acquisition

One of the most widely debated questions in SLA research concerns the role of age in L2 acquisition. The debate focuses on a key difference between first and second language acquisition, namely the fact that language acquisition in childhood usually results in native-like competence in one or more languages, whereas language acquisition in adulthood is unlikely to be as successful. This difference between child and adult learners, also known as the age-of-acquisition (AoA) effect, has often been explained in terms of a critical period for language development. The idea that there might be a critical age period for the acquisition of language is usually traced back to researchers such as Lenneberg. According to Lenneberg (1967), language acquisition from mere exposure to the linguistic environment is only possible before the critical period. After this period, learners cannot rely on the same learning mechanism to acquire language, with the consequence that their levels of ultimate attainment in the L2 will necessarily fall short of native-like ability.

The debate has centered on a series of questions, for example: Is there a critical period for language acquisition, as suggested by Lenneberg (1967), or can the age effects in L2 acquisition be explained by other factors (differences in quality and quantity of input, practice, social-psychological factors, etc.)? If there is a critical period, when does this period occur and how should it be explained? How does age affect the acquisition of the different elements of language (syntax, morphology, phonology, lexicon, etc.)? While these and other questions continue to be subject to debate, there is empirical evidence to suggest that younger learners do, in fact, have an advantage in ultimate attainment (though not in rate of learning), and that this advantage holds for both pronunciation and grammar learning. The decline of language learning ability seems to take place gradually, from ages 6–7 to 16–17. And, importantly, it appears that the AoA effect cannot be fully explained by factors such as input, use of L1 and L2, social-psychological factors, or length of residence. For comprehensive reviews of the literature see DeKeyser and Larson-Hall (2005) and DeKeyser (in press).

DeKeyser has been an active contributor to the debate on age effects in L2 acquisition (see, e.g., DeKeyser, 2000, 2007a). One of his widely cited studies, DeKeyser (2000), had two aims. The first was to extend Johnson and Newport's (1989) correlational study. Johnson and Newport asked native speakers of Chinese and Korean who had immigrated to the United States at various ages (3–39) to perform on an auditory grammaticality judgment test. Performance on the latter was used to assess their knowledge of a range of morpho-syntactic structures in English. This allowed them to relate proficiency (as measured by performance on the grammaticality judgments) to the age at which subjects began learning L2 English. Johnson and Newport found a strong negative correlation of $-.77$ between AoA and L2 proficiency. DeKeyser (2000) extended this study by looking at a different population and avoiding certain methodological problems. Another aim of DeKeyser (2000) was to test the fundamental difference hypothesis (Bley-Vroman, 1988), which states that, while children are able to learn their native language(s) through implicit learning mechanisms, adults have largely lost this ability and have to rely on general learning mechanisms and analytic abilities instead. If this is the case, then one might expect verbal aptitude to play an important role in adult, but not in child, language learning. DeKeyser thus sought to determine whether the aptitude effect varies with age and the age effect with aptitude.

DeKeyser (2000) recruited 57 native speakers of Hungarian who were residing in the United States. The age of arrival range was 1–40, all participants had resided in the US for at least 10 years (average length of residence 34 years), and levels of education and occupational status varied widely. Subjects performed on an adapted version of Johnson

and Newport's (1989) grammaticality judgment test. In addition, subjects also completed a Hungarian verbal ability test (Ottó, 1996). DeKeyser found a strong negative correlation between AoA and proficiency (as assessed by the grammaticality judgments), $r = -.63$, which replicated Johnson and Newport's (1989) findings. DeKeyser also found that, after the age of 16, only those learners with high verbal aptitude scores also achieved high scores on the grammaticality judgment test. This suggests that the only way that an adult learner can achieve grammatical competence similar to that of a native speaker is by using analytical, problem-solving abilities, as predicted by the fundamental difference hypothesis. Aptitude does not predict ultimate attainment by child learners because the latter can rely on implicit learning mechanisms. More recently, DeKeyser, Alfi-Shabtay, and Ravid (2010) provide crosslinguistic support for these findings.

Second Language Acquisition as Skill Learning

If language acquisition in adults is qualitatively different, then how can this process be characterized? DeKeyser contributed to this question in several studies, the most influential being his experiment on the automatization of explicit L2 grammar rules. DeKeyser (1997) trained 61 subjects on an artificial language (*Autopractan*) that consisted of 32 vocabulary items and four morphosyntactic rules. At the beginning, subjects received explicit training on how the artificial language worked. Once they reached criterion on a set of metalinguistic tests, subjects received comprehension and production training for a period of eight weeks. Comprehension practice consisted of choosing between pictures displayed on a computer screen to match a sentence. Production practice consisted of typing the correct sentence corresponding to the picture. Subjects were divided into three groups: Group A received comprehension practice on rules 1 and 2, and production practice on rules 3 and 4. Group B did the reverse, that is, comprehension practice on rules 3 and 4 and production practice on rules 1 and 2. Group C received comprehension and production practice on all four rules. DeKeyser (1997) found that the learning of morphosyntactic rules was highly skill-specific, that is, large amounts of practice in comprehension and production led to great improvements in the practiced skill but not in the reverse skill. Importantly, he also found that these skills develop gradually over time, following the same power function learning curve as the acquisition of other cognitive domains (e.g., geometry, computer programming). DeKeyser (1997) interpreted these results as being consistent with skill acquisition theory, an information-processing approach that defines learning as the gradual conversion of declarative (explicit) knowledge into procedural (implicit) knowledge by means of practice (automatization) (see DeKeyser, 2001, for an overview).

Conclusion

DeKeyser's work has important implications for our understanding of L2 acquisition. His work on age effects has provided strong evidence for a quantitative decline of language learning ability and a qualitative shift in learning mechanisms (implicit vs. explicit) as a function of age before adulthood, at least for the case of morphosyntax. Moreover, his research on L2 acquisition has shown that providing adults with explicit knowledge can be beneficial, assuming this is followed by ample opportunities to practice. DeKeyser's work thus provides evidence for an interface between explicit and implicit knowledge. Furthermore, DeKeyser's research suggests that adult L2 acquisition can, in fact, be conceived of as an explicit learning process, that is, a learning process in which subjects rely on their analytic abilities and not on an implicit process of induction. This process is skill-specific and highly dependent on language aptitude, with adult learners who score high on verbal ability measures significantly outperforming learners with low verbal ability

scores. In terms of pedagogical implications, DeKeyser's (2000, 2010) observation that explicit learning processes are a necessary condition for achieving a high degree of proficiency in the L2 after childhood suggests that teaching approaches that deny adult learners the value of explicit, form-focused instruction are flawed. His work on automatization confirms that there is, in fact, a place for systematic and extended practice of rules in the teaching curriculum.

Depth of Vocabulary Knowledge

STUART WEBB

Depth of vocabulary knowledge refers to how well words are known. Developing vocabulary depth typically involves the accumulation of knowledge through encountering and using words in a variety of different contexts in order to learn the forms, meanings, and uses of words. Knowledge of a word's spelling, pronunciation, derivations and inflections, meaning senses, semantic associations, collocations, and grammatical functions, and when it may be appropriate or inappropriate to use it are all required to fully know words (Nation, 2001). Vocabulary depth is indicated by the extent to which these aspects of vocabulary knowledge are present, and this in turn signals the extent to which words may or may not be used successfully.

The term "depth of knowledge" was introduced as one dimension of vocabulary knowledge by Anderson and Freebody (1981) in contrast to a second dimension, breadth of knowledge. Breadth refers to how many words are known and is typically indicated by scores on tests of vocabulary size, such as the Eurocentres Vocabulary Size Test (Meara & Jones, 1990) and the Vocabulary Size Test (Nation & Beglar, 2007). Breadth is usually determined by the degree to which learners are able to link form to meaning. Being able to link form to meaning is an important step in vocabulary development because it increases the likelihood that words may be understood and used. However, it does not ensure that these words will be understood and used correctly and this is why there is also a need for learners to develop vocabulary depth. Several studies have found positive correlations between depth and breadth of knowledge (Nurweni & Read, 1999; Qian, 1999; Vermeer, 2001). However, in each of these studies there was partial overlap between the constructs measured by the tests making further research warranted.

It is important for teachers to consider depth when planning the vocabulary learning component of a course because accumulating the knowledge necessary to understand and use words fluently may often be a long process. Awareness of how different types of learning may affect vocabulary knowledge can help teachers to design and sequence activities to promote depth. Teachers may also look at depth of knowledge when diagnosing language weaknesses. Measuring depth of knowledge can show us what learners know and do not know about words. For example, unusual word combinations in speech and writing often signal limitations in knowledge of collocation, while an inability to produce different derived forms of a word may indicate a lack of knowledge of word parts. Awareness of vocabulary depth can also help teachers to see how tasks and activities contribute to learning and the need for different types of tasks to be used together to develop richer knowledge of words. It is also essential for researchers to take vocabulary depth into consideration when measuring learning. Measuring learning with a single test of form and meaning may only measure a fraction of what may be known about a word.

What Is Depth of Knowledge?

There have been many descriptions of vocabulary knowledge (Richards, 1976; McCarthy, 1990; Nation, 1990, 2001; Aitchison, 1994; Laufer, 1997; Henriksen, 1999; Miller, 1999;

2 DEPTH OF VOCABULARY KNOWLEDGE

Table 1 Description of vocabulary knowledge (from Nation, 2001, p. 27)

Form	Spoken	R	What does the word sound like?
		P	How is the word pronounced?
	Written	R	What does the word look like?
		P	How is the word written and spelled?
	Word parts	R	What parts are recognizable in this word?
		P	What word parts are needed to express the meaning?
Meaning	Form and meaning	R	What meaning does this word form signal?
		P	What word form can be used to express this meaning?
	Concept and referents	R	What is included in the concept?
		P	What items can the concept refer to?
	Association	R	What other words does this make us think of?
		P	What other words could we use instead of this one?
Use	Grammatical functions	R	In what patterns does this word occur?
		P	In what patterns must we use this word?
	Collocation	R	What words or types of words occur with this one?
		P	What words or types of words must we use with this one?
	Constraints on use	R	When, where, and how often would we expect to meet this word?
		P	Where, when, and how often can we use this word?

Note. R = receptive knowledge, P = productive knowledge.

Schmitt, 2000; Read, 2004). However, there is no definition of vocabulary depth that is widely agreed upon. Nation's (2001) description of what is involved in knowing a word is the most comprehensive account of depth. He classifies vocabulary knowledge according to form, meaning, and use; each category contains three aspects of knowledge and each aspect of knowledge can be broken down into receptive and productive components. This results in 18 unique components of vocabulary knowledge. Vocabulary depth is the extent to which each of these components is present. Table 1 shows Nation's description of vocabulary knowledge.

Receptive or passive knowledge is what is required to understand words when they are encountered in listening and reading. Productive or active knowledge is the knowledge necessary to use a word in speech and writing. For example, receptive knowledge of written form involves recognizing the spelling of a word when it is encountered and receptive knowledge of form and meaning involves recognizing the meaning that a particular form conveys. On the other hand, productive knowledge of written form involves being able to spell a word correctly and productive knowledge of form and meaning involves being able to produce a word that conveys the intended meaning.

There is often an assumption that receptive knowledge precedes productive knowledge. However, this may only be true if we look at the individual aspects of vocabulary knowledge rather than the broader construct of knowing words. For example, the ability to recognize the spelling of the written form of a word is likely to precede the ability to spell it correctly, or the ability to recognize that a specific written form conveys a specific meaning is likely to precede the ability to convey a specific meaning using the correct word form. In contrast, it may be possible to spell a word correctly (productive knowledge of written form) or use the word with grammatical accuracy (productive knowledge of grammatical functions) before the meaning of the word is understood (receptive knowledge of form

and meaning). Thus, to examine receptive and productive vocabulary knowledge, it is necessary to differentiate between receptive and productive knowledge of individual aspects of knowledge rather than receptive and productive knowledge of words as a whole.

When considering vocabulary depth, it is important to differentiate between strength of knowledge and depth of knowledge (Nation & Webb, 2011). Strength of knowledge refers to how well a single aspect is known. Each of the aspects can be learned to different degrees, from no knowledge to varying degrees of partial knowledge to full knowledge. For example, being able to identify the correct spelling of a word (receptive knowledge of written form) from among a number of unrelated spellings may indicate minimal knowledge of written form. Identification of the correct spelling of the word from among a number of closely related spellings may indicate greater knowledge of written form, and correctly spelling the word may indicate full knowledge of written form. Strength of knowledge may move in both directions. Knowledge is likely to increase the more a word is encountered and used, but if there are long gaps between encounters, knowledge may decrease. Strength of knowledge provides some indication of depth of knowledge. However, because measuring strength of one aspect involves assessing only a portion of the construct of depth, researchers should be careful not to generalize from strength to depth. Gaining depth of knowledge involves learning all nine aspects of knowledge.

Measuring Depth of Knowledge

Research on assessing vocabulary depth is still in its infancy. Read (2004) reports that depth has been operationalized in research in three ways: precision of meaning, comprehensive word knowledge, and network knowledge. These categories provide some direction on how depth might be measured. However, each one is limited in the degree to which depth is measured, and overlap between the categories suggests that together they may still not provide an accurate assessment of depth.

The Vocabulary Knowledge Scale (VKS: Wesche & Paribakht, 1996) and the Word Associates Test (WAT: Read, 1993, 1998) are established tests designed with the purpose of measuring vocabulary depth. Both tests were useful improvements on traditional measures of form and meaning. However, both are limited in the degree to which they indicate depth. The VKS uses the following scale to measure depth:

1. I don't remember having seen this word before.
2. I have seen this word before, but I don't know what it means.
3. I have seen this word before, and I think it means _____.
4. I know this word. It means _____.
5. I can use this word in the sentence: _____.

Although different points on the scale may indicate an increase in knowledge, it is impossible to tell if there is an ordinal progression in any aspect of knowledge besides form and meaning. For example, at only point 5 on the scale is grammatical accuracy required. However, knowledge of the grammatical functions of an item may be present at a lower point on the scale; it is possible to use a word correctly in a sentence without knowing its meaning.

The WAT measures knowledge of three aspects—form and meaning, concept and referents, and collocation—and provides an overall score indicating how well items are known. However, it does not provide a separate measure of each of these aspects, so it is not clear to what extent each aspect is known. For example, one testee could score solely on their knowledge of form and meaning for all items, and another could score solely on

their knowledge of collocation. The test would show that both testees had a similar amount of knowledge and lacked some degree of depth (a useful finding) but would not differentiate between what was known and what was lacking. Moreover, if the known aspect was always form and meaning then the test would have little value as a measure of depth. Separate tests focusing on individual aspects may provide a more accurate measurement of depth.

A more useful approach to measuring depth is to examine multiple aspects of knowledge and measure the strength of knowledge of each of those aspects. A series of studies by Norbert Schmitt and his colleagues (Schmitt & Meara, 1997; Schmitt 1998, 1999; Pigada & Schmitt, 2006) and Webb (2005, 2007a, 2007b, 2008, 2009a, 2009b) have used this approach. Schmitt's (1998) study was particularly innovative as he used interviews to measure different degrees of strength of knowledge of written form, associations, grammatical information, as well as form and meaning. By measuring strength of each aspect of knowledge he was able to show that there is movement in multiple aspects of knowledge over time; thus knowledge of an aspect is not a dichotomy (complete or incomplete) but tends to gradually increase or decrease in degrees of knowledge. Webb (2005, 2007a, 2007b, 2009a, 2009b) examined the effects of different vocabulary-learning activities on five aspects of knowledge. He created receptive and productive tests to isolate and measure written form, form and meaning, association, collocation, and grammatical functions. In a study examining the effects of repetition on vocabulary knowledge, Webb (2007b) showed the value of measuring different aspects of knowledge to evaluate learning. As the number of repetitions increased, vocabulary knowledge increased to different degrees; measuring multiple aspects indicated significantly greater knowledge of some aspects but not others. The results would not always have indicated differences in knowledge if only a single aspect had been assessed. The research also highlighted the need for multiple measures at different sensitivities to measure strength of knowledge of each aspect. Often there was no difference in knowledge between groups at one level of sensitivity (receptive or productive), but there was a difference at the other level. This finding builds on Nagy, Herman, and Anderson's (1985) research, which demonstrated the importance of using multiple tests at different sensitivities to provide an accurate assessment of form and meaning.

Meara and Wolter (2004) argue for a different approach to measuring depth. They report that using a battery of tests to measure depth for a small number of words is impractical, and instead suggest measuring depth for sets of words in a similar way to how vocabulary size is examined. They use the V_Links software version 2.00 to measure knowledge of associations for sets of 20 words taken from the most frequent 1,000 words. The study provides a useful approach to how depth and vocabulary size could be measured individually to provide a more comprehensive measurement of vocabulary knowledge.

Developing Vocabulary Depth

Planning vocabulary learning is essential if learners are to develop vocabulary depth. Teachers must decide which words are to be learned during a course and how they will provide the opportunities necessary to develop knowledge of those words (Nation, 2008). A lack of planning may lead to an inability of students to successfully use the words that they have learned—a situation common to many foreign-language classrooms. Nation's (2001, 2007) four strands (meaning-focused input, meaning-focused output, language-focused learning, fluency development) provide a useful approach to developing vocabulary depth. Each strand may contribute to vocabulary development in different ways, and allocating a similar amount of time to learning in each strand is likely to lead to deeper learning than learning solely in one strand.

Language-focused learning includes deliberate learning of new words. Although activities can be created and modified to focus on multiple aspects of vocabulary knowledge, many activities focus on strengthening the link between form and meaning. This is a logical place to start with learning. The other strands can build upon this initial learning of form and meaning to develop the comprehensive vocabulary knowledge necessary to use and understand words fluently.

In the meaning-focused input strand, words should be encountered repeatedly in a variety of original contexts. It is well established that repeated encounters in context contribute to learning form and meaning but are also likely to help develop all other aspects of knowledge (Pigada & Schmitt, 2006; Webb, 2007b) with the mode of input (spoken or written) having an effect on the degree to which spoken and written form is learned. Meaning-focused input is likely to have a greater effect on increasing receptive knowledge than on productive knowledge.

Meaning-focused output involves using language in speech and writing. The meaning-focused output strand may help to push vocabulary knowledge from receptive understanding to productive use. The fluency development strand probably receives the least attention in courses. However, it also plays an important role in facilitating vocabulary depth. In this strand, the aim is to use or understand words in a native-like manner. Time pressure is one of the criteria to help facilitate increased processing speed and vocabulary fluency. It may be that this move toward native-like lexical access speed in each of the four skills may indicate the degree of word mastery.

Few teaching techniques are designed to develop all aspects of knowledge, and most are focused on strengthening the link between form and meaning. For example, to successfully complete matching activities, multiple-choice questions, and crossword puzzles, students typically need to correctly link form and meaning. There is justification for focusing on form and meaning because it allows the meaning of words encountered to be understood. Also, if there is overlap in L1 and L2 vocabulary knowledge, learners may gain knowledge of other aspects by linking L1 meaning to L2 form (Webb, 2007c). One aspect of knowledge that receives little attention in vocabulary-learning activities but deserves more attention is word parts. Learning word parts such as the prefixes *mid-*, *mis-*, and *multi-* and the suffixes *-able*, *-ee*, and *-er* provides knowledge that can be used to aid future vocabulary learning. For example, knowing that *mid-* in *midnight* means 'middle' and that *-ee* in *employee* means 'person' may help learners to understand other items that contain the same word parts when they are encountered, for example in *midsummer*, *midlife*, *referee*, and *nominee*.

The order of learning the aspects of knowledge may depend on how a word is learned. There is some evidence that, when words are encountered during reading, knowledge of written form is gained first (Pigada & Schmitt, 2006; Webb, 2007b). Schmitt (2010) suggests that typically the written and spoken form are most likely learned first followed by form and meaning and grammatical functions, while the aspects that relate to use may be learned last.

Students need to be aware of what is involved in knowing a word if teachers expect them to effectively learn words. Teachers can raise awareness of depth of vocabulary knowledge in a number of ways. Activities such as Schmitt and Schmitt's (1995) vocabulary notebooks, which explicitly focus attention on different aspects of knowledge, are useful for this. Concordances are also a useful tool for developing depth of knowledge. A concordance is a collection of examples of the use of a word. By seeing a word used in many different ways, knowledge of form, meaning, and use may be gained. Another useful approach is to use a sequence of activities that each focus on developing different aspects of knowledge. Sökmen (1992) provides an excellent example of how this might be done. She describes an approach which begins with students learning the form and meaning of unknown words. This is followed with activities that each focus on increasing

knowledge of another aspect of knowledge for those words until finally students may have gained knowledge of form and meaning, spoken and written form, word parts, associations, collocations, grammatical functions, and concept and referents.

Developing the students' vocabulary depth should also include measuring their depth of knowledge. This provides teachers with a more complete picture of the students' knowledge and also demonstrates to students the importance of learning other aspects as well as form and meaning. Tests and quizzes can vary the aspects of knowledge that are examined. For example, one quiz might measure knowledge of form and meaning and another might measure knowledge of collocation. The questions within a quiz might also be written to measure different aspects of knowledge. The following questions show one way in which different aspects of knowledge might be measured for a word.

Underline the word that is not likely to be used together with *accept* (receptive knowledge of collocation):

1. offer
2. holidays
3. invitation
4. responsibility

Underline the correct spelling (receptive knowledge of written form):

1. acpt
2. acsept
3. accept
4. axept

Underline the incorrect derivation (receptive knowledge of word parts):

1. acception
2. accepting
3. acceptance
4. acceptable

Underline a word with an unrelated meaning (receptive knowledge of association):

1. decline
2. receive
3. refuse
4. reduce

Underline the correct sentence (receptive knowledge of grammatical functions):

1. She accepts.
2. It is accept.
3. It is an accept.

Conclusion

As we have seen, it is important for teachers, learners, and researchers to have an understanding of vocabulary depth. Developing depth of knowledge should influence how courses with a vocabulary-learning component are designed and how learners approach their vocabulary learning. Awareness of what is involved in knowing a word can highlight what aspects of knowledge need to be measured to help researchers to more accurately assess learning.

Describing and Illustrating Quantitative Data

TADAYOSHI KAYA

Descriptive statistics, which aim to quantitatively summarize, organize, and visualize data sets, will be explained in detail in this entry. By first dealing with your data descriptively, you will be able to familiarize yourself with them, comprehend them more profoundly, and choose the right statistics to analyze them. Descriptive statistics are defined as “the process of directly describing the characteristics of either populations or samples” (Van Blerkom, 2009, p. 216), and are the first tools with which to examine your data, before conducting any statistical analyses. With empirical and fictional data sets, three main concepts—describing data, displaying data, and transforming data—will be explored in order to understand how to describe and illustrate quantitative data in the field of applied linguistics.

Describing Data

Descriptive statistics, as Goodwin (2008, p. 135) describes, enable us “to turn a large pile of numbers that cannot be comprehended at a glance into a very small set of numbers that can be more easily understood.” In this first section, methods of describing data will be examined in terms of measures of central tendency, measures of spread or dispersion, and measures of frequency.

Measures of Central Tendency

Measures of central tendency are the basic tools of descriptive statistics (Rasinger, 2008), and second language researchers usually apply one or more measures of central tendency in order to precisely understand the information of typical behaviors of language learners (Mackey & Gass, 2005). There are three commonly used measures of central tendency: mean, median, and mode.

The *mean*, or the *arithmetic mean* to be exact, is what most of us know as the “average,” and is the most widely used statistic to find out where the center of data is located (Linn & Gronlund, 2000). It is simply “the sum of all scores divided by the total number of cases,” and is represented by the symbol $\bar{x}$ (x-bar) when it is the mean of a sample, and by the symbol μ (the lower-case Greek letter “mu”) when it is the mean of a population (Brown & Saunders, 2008). Regarding the sample mean, however, the *Publication Manual of the APA* (American Psychological Association, 2009) allows the use of M as well as $\bar{x}$. Imagine that you let a group of 15 students work with a vocabulary exercise and record the time spent in minutes by each student as follows:

37, 37, 40, 40, 40, 41, 41, 42, 43, 43, 44, 45, 46, 51, 51

By only looking at the raw data above, it is difficult to comment on the data on the spot. Therefore, we would calculate the mean and locate the “average” of all the scores in order to better understand the data. First, all the scores are added up (= 641), and are divided

2 DESCRIBING AND ILLUSTRATING QUANTITATIVE DATA

by the total number of the students (15), which gives us a mean time of 42.73 minutes. The mean value is used most commonly since it takes into account all the values. However, this statistic is very sensitive to extreme values (or *outliers*), especially when the number of participants is small (Mackey & Gass, 2005). Extremely high scores will move the mean value upwards, while extremely low scores will move it downwards. Thus, in the presence of outliers and small sample sizes, the use of the mean should be avoided.

Strictly speaking, the mean should be calculated with variables measured at the interval and ratio levels. Some statisticians argue that calculation of the mean for nominal data is nonsensical (e.g., the mean of gender), and that ordinal data is unsuitable for any calculation because of unequal intervals (Muijs, 2004; Brown & Saunders, 2008; Van Blerkom, 2009). As for ordinal data, however, there are many researchers in applied linguistics who apply statistics such as means, standard deviations, and some statistical tests to ordinal data, by treating them as an interval data equivalent. In practice, this less strict application of levels of measurement has been accepted in recent years, and the use of the mean with ordinal data is not considered necessarily problematic. See Warner (2008, pp. 6–10) for more detail.

When a mean score is not appropriate because of outliers, or when the data have small sample sizes, another alternative statistic for central tendency would be the *median* (Hatch & Lazaraton, 1991). In order to obtain the median, no mathematical calculation is involved; all the scores should be sorted from high to low, and the middle score is the median—the score at the center of the distribution which splits the group in half (the fiftieth percentile) (Dörnyei, 2007). In the case of the aforementioned example, 42 minutes, which is located at the center of the 15 participants, is the median of the data.

The median is not sensitive to outliers, but is only dependent on the center of distribution. For example, the medians of the fictitious data below (= 30) are identical in both cases.

Group 1: 10, 20, 20, 20, 30, 35, 40, 40, 50

Group 2: 10, 15, 20, 25, 30, 70, 75, 90, 200

The difference of the values below and above the median is ignored, and the high scores in the second group have no influence on the median (Norušis, 2008).

To explore the central tendency of nominal data, the mean or the median are not appropriate. Therefore, there is another type of “average,” the *mode* (Muijs, 2004), which can also be used with ordinal, interval, or ratio data. The mode is the most frequently occurring score, and can be obtained from the largest number of participants (Clark-Carter, 2010). In the case of Group 1 in the data above, the mode is 20 (the most frequently obtained score), since there are three participants who obtained the same score—the highest number of participants of all. Unlike the mean and the median, this statistic can have more than one value. If one of the participants had obtained 40 points, for instance, there would have been two modes (called *bimodal*): 20 points and 40 points. In addition, the terms *a major mode* or *a minor mode* are sometimes used in studies, the major mode being the value with the highest frequency and the minor mode being the value with the second highest frequency (Asquith, 2008).

Measures of Spread, Dispersion, and Variability

It is insufficient to rely only on the central values; we also need to examine how data values are spread from or cluster around the central tendency. If we take a look at the vocabulary test scores from two different (fictional) classes shown in Table 1, the means and the medians of the two classes are exactly the same. A careful examination of the data, however, shows that the spread of scores in Class 1 (62 to 94) is much wider than that of Class 2

Table 1 Vocabulary test scores of two English classes (fictional)

<i>Student #</i>	<i>Class 1 (n = 12)</i>	<i>Class 2 (n = 12)</i>
1	62	76
2	70	78
3	70	78
← First quartile		
4	74	78
5	78	80
6	78	80
← Third quartile		
7	82	80
8	82	82
9	88	82
10	90	82
11	92	82
12	94	82
Mean	80	80
Median	80	80

(76 to 82), indicating that other important information is missing. Since the measures of central tendency alone do not give us the whole story of the data, we also need to examine additional information on the spread, dispersion, or variability. There are three common measures of spread: the range, the interquartile range, and the standard deviation.

A simple and crude measure of this kind is the *range* (Linn & Gronlund, 2000), which can be calculated by subtracting the lowest value (the *minimum*) from the highest (the *maximum*). In the case of Table 1, the range for Class 1 is 32, while that of Class 2 is 6. This statistic is easy to obtain, but ignores all the data values but the lowest and the highest ones, and the rest of the values do not have any influence on the range at all (Brown & Saunders, 2008). Thus, outliers that can affect both the highest and lowest values might distort the value of the range. For this reason, the range is not used commonly in second language studies, and is not considered a reliable measure of spread (Mackey & Gass, 2005).

Another measure of spread is the *interquartile range*, which takes into account the middle 50% of the total scores. The interquartile range is the distance between the third quartile (75th percentile) and the first quartile (25th percentile), calculated by subtracting the first quartile from the third quartile. In the example in Table 1, the interquartile range of Class 1 is 17 ($89 - 72 = 17$), and the one for Class 2 is 4 ($82 - 78 = 4$). This method of calculation is the simplest one, cited in Linn and Gronlund (2000), but there exist other calculation methods for the interquartile range (see, e.g., Brown & Saunders, 2008). Through this calculation, the interquartile range is less affected by outliers than the range, because it omits the lowest and highest 25% of the data. Some researchers use *semi-interquartile range* (also called *quartile deviation*), which is obtained by dividing the interquartile range by 2 (Clark-Carter, 2010).

The most reliable measure of spread is the *standard deviation*. Unlike the range and the interquartile range, which only utilize some portions of the total data, this statistic takes into consideration the deviations from the mean of all scores. It is defined as “the square root of the average squared distance of the scores from the mean,” a value that indicates

4 DESCRIBING AND ILLUSTRATING QUANTITATIVE DATA

Table 2 Calculation table for standard deviation: vocabulary test scores of Class 1 (fictional)

Student #	Class 1 (n = 12)	Difference from the mean	Difference squared
1	62	-18	324
2	70	-10	100
3	70	-10	100
4	74	-6	36
5	78	-2	4
6	78	-2	4
7	82	2	4
8	82	2	4
9	88	8	64
10	90	10	100
11	92	12	144
12	94	14	196
Mean = 80			Sum = 1080

“how all scores are spread around the mean” (Mackey & Gass, 2005, p. 259). The calculation of the standard deviation is more complicated, and an understanding of the concept is not intuitive.

To obtain the standard deviation, the first step is to obtain the mean value. In the case of Table 2, the mean is 80. The difference from the mean for each score should be calculated, and then squared. Next, find the sum of squared differences, and divide it by $n - 1$. This value is called *variance (sample)*, and it is 98.18 ($1080 / 11$) for the example. Typically, the denominator, $n - 1$, is used for a sample, while the denominator, n , is used for a population. Since it is rare to collect data for the entire population, $n - 1$ is usually used (Brown & Saunders, 2008). The variance obtained here is not expressed in the original units of the test scores, so it is useful to take the square root of the variance, called the standard deviation, in order to understand more intuitively; it is 9.91 ($\sqrt{98.18} = 9.91$). This final value, which describes the amount of spread of all the single values within the data, is the most reliable measure of spread. The letter *s* (*SD* or *sd*) denotes the standard deviation of a sample, while the lower-case Greek symbol sigma, σ , is used for a population (Howitt & Cramer, 2000).

Measures of Frequency

So far, we have mainly explored how to deal with interval data. In this section, instead of examining how much, we will see *how often* something occurs in nominal or ordinal data: the *frequency*, which is another important measure for descriptive statistics. When a phenomenon or a behavior is counted, the number obtained through mere counting is the frequency. In Table 3, the results of a corpus analysis are displayed in the form of a *frequency table*. This analysis was conducted with written academic corpora to investigate the difference in the sentence positions of linking adverbials (nominal data: Initial / Middle / Final) between native English speakers and English learners. From the column labeled “Freq.” in Table 3, we can easily see that the native speakers used linking adverbials in the initial position 2,262 times, in the middle position 3,120 times, and in the final position

Table 3 Difference in the positions of linking adverbials

Position	Native speakers		English learners	
	Freq.	%	Freq.	%
Initial	2262	41.7	1194	61.5
Middle	3120	57.5	729	37.5
Final	44	0.8	20	1.0
Sum	5426	100.0	1942	100.0

Note. Frequencies are per 1,000,000 words.

Table 4 Results of questionnaire in two groups (fictional)

Group 1 (n = 500)				
	Freq.	Cum. freq.	%	Cum. %
Strongly agree	184	184	36.80	36.80
Agree	128	312	25.60	62.40
Disagree	83	395	16.60	79.00
Strongly disagree	105	500	21.00	100.00
Total	500		100.00	
Group 2 (n = 400)				
	Freq.	Cum. freq.	%	Cum. %
Strongly agree	123	123	30.75	30.75
Agree	139	262	34.75	65.50
Disagree	96	358	24.00	89.50
Strongly disagree	42	400	10.50	100.00
Total	400		100.00	

44 times, while the English learners used them in the initial position 1,194 times, in the middle position 729 times, and in the final position 20 times. This frequency table provides us with a better understanding of the results, as compared to just looking at the raw data or reading the results in a sentence.

A frequency table can also be used with ordinal data, as shown in Table 4 (the results of a fictional questionnaire in two different groups). The column labeled "Freq." shows the numbers of people (frequencies) in four ordinal categories. The next column, labeled "Cum. freq.," represents the *cumulative frequency*, which is "the running total of frequencies across all the classes (categories)" (Rasinger, 2008, p. 96). The first value in the cumulative frequency is identical to its frequency value. The second value, however, is the sum of the first frequency value and the second one ($184 + 128 = 312$). By having the cumulative frequency value, we can see that there were 312 people who answered in the affirmative (strongly agreed or agreed) in the questionnaire of Group 1, for instance.

The merely counted frequencies described above are also called the *absolute frequencies*, to be specific. When we want to compare the frequencies of more than one group, however, we need to explore each frequency in connection with the rest of data, in order to put them

on the same comparable measure. The third column, labeled “%,” gives *percentages* of the data. For the frequency of the people who strongly agreed in Group 1, first, the absolute frequency (184) was divided by the total number of frequencies (500). This value is called the *proportion* ($184 / 500 = .3680$). The result (proportion) was then multiplied by 100 to obtain the percentage. Even though the absolute frequencies in Group 1 and Group 2 are not comparable because of the different total numbers, the percentages of the two groups can be compared. The percentage and the proportion are also called *relative frequencies*.

Displaying Data

Instead of looking at numbers in tables, sometimes people find it much easier to see the same data in graphics. With the advance of statistical computer software, such as SPSS (distributed by IBM), it has become much easier for researchers to create graphical data displays, and we encounter various types of visual representation of data in books and journal articles. Therefore, this section will be devoted to introducing different types of data display.

Pie Charts

Figure 1 displays the same percentage information as Table 4. This type of display is called a *pie chart*, named after its unique and distinctive shape. Unlike other displays, pie charts are not based upon *x*- and *y*- axes, but rather show the subcomponents of the total in a circle area (Clark-Carter, 2010). Pie charts are best used to display proportion or percentage data (Hatch & Lazaraton, 1991). There are 360° in a circle, and subcomponents in the data are represented as slices of the pie. In Figure 1, there are 184 (36.80%) people in Group 1 who strongly agree. In order to display this portion as a slice, 36.80% of the total degrees of the circle (360°) should be occupied in the pie, which is 132.48° ($360 \times .3680 = 132.48$).

Bar Charts

With a pie chart, the portions of cases are expressed as slices or areas. In the case of the charts in Figure 2, however, the numbers of cases are represented by bars or lengths. This

Figure 1 Pie charts of questionnaire results (fictional)

Figure 2 Bar charts of questionnaire results (fictional)

type of display is called a *bar chart*. The higher a bar is, the higher the data value is. In Figure 2, the *x*-axis (horizontal) shows the four categories of responses, and the *y*-axis (vertical) shows the frequencies. It is clear from the bar chart that the number of people who strongly agreed is the highest in Group 1, for instance. Also, by looking at the whole pictures of the two groups, it is possible to compare the trends of the two groups instantly.

Histograms

The next graphical display is a *histogram*, which is similar to a bar chart, except that each bar represents a range of values (Norušis, 2008) and that there is no space between the bars. In a histogram, the frequencies usually come from interval or ratio data, while a bar chart uses nominal or ordinal data. Brown and Saunders (2008, p. 48) state that histograms are utilized when we would like to “emphasize the highest and lowest values or the distribution of values for a variable.” An example of a histogram is shown in Figure 3, the data of which come from an empirical data set collected by the author in 2002. The histogram shows the spread of scores in a computer (PC) familiarity test of 50 students.

The smooth bell-shaped curved line that is superimposed upon the histogram in Figure 3 is an ideal *normal distribution* for the sample ($\bar{x} = 33.76$, $s = 4.27$). The normal distribution, also called the *normal curve*, is a hypothetical distribution in which all the values of the population are assumed to be included in the data. In the normal distribution, the three measures of central tendency (the mean, the median, and the mode) are all in the middle of the curve. When an empirical distribution is similar to the normal distribution, we can apply the statistical characteristics of the normal distribution to the empirical one (Goodwin, 2008). That is, for a normally distributed data sample, we can assume that approximately 68% ($34.1 + 34.1 \approx 68$) of the data values fall into the ($\pm$) one standard deviation unit, and about 95% ($34.1 + 34.1 + 13.6 + 13.6 \approx 95$) into the ($\pm$) two standard deviation units (see Figure 4). The use of a histogram is important when we try to determine whether an empirical distribution is close to the normal distribution and when we examine how the data are spread, since empirical distributions can result in many different shapes.

Line Charts (Frequency Polygons)

Another way of displaying interval or ratio data is with a *line chart* or a *frequency polygon* (Van Blerkom, 2009). Figure 5 shows an example of a line chart based on the same data

Figure 3 Histogram of PC familiarity scores

used in Figure 3. The difference, though, is the line drops located in the data (at the scores of 34 and 37), which cannot be detected in the histogram in Figure 3. Rasinger (2008, p. 103) also states that a line chart is “useful for displaying increases and decreases, or temporal sequences.”

Stem-and-Leaf Plots

A *stem-and-leaf plot* is a variant of the histogram (Clark-Carter, 2010). While the histogram loses the actual individual scores which are grouped in each interval, the stem-and-leaf can provide us with the values of the individual observations, and preserve the values of raw frequencies (Linn & Gronlund, 2000). An example of stem-and-leaf plots is shown in Figure 6, based on the same data as Figures 3 and 5. The plot shows the actually observed values, by putting the first digits (or leading digits) in the *stem*, and the second digits (trailing digits) in the *leaf*. Each row in the plot represents a stem, and each observation is expressed as a leaf. In the second row of the plot, for example, we see this long line of numbers: 2.67788899. This indicates that there are eight different scores in the stem, 26, 27, 27, 28, 28, 28, 29, and 29.

Box Plots

Box plots are used to compare distributions, as is shown in Figure 7. The left-hand box plot was created based upon the data in Table 1. The box in the plot extends from the 25th percentile to the 75th percentile (the middle 50% of the data), and the whiskers (the vertical lines above and below) extend to the largest and smallest values within 1.5 box

Figure 4 Standard deviation diagram (© 2007 Petter Strandmark [Wikimedia Commons, Creative Commons Attribution 2.5 Generic license] based on an original graph by Jeremy Kemp, in 2005-02-09)

Figure 5 Line chart of PC familiarity scores

length (when computed with SPSS). The middle line in the box represents the median of the observed data (Norušis, 2008). By looking at the box plot, we can easily recognize that the variation of Class 1 is much wider than that of Class 2.

When the concept of the mean was explained in the previous section, the term “outliers” (extreme values) was introduced. Box plots are also used to detect outliers. In the box plot on the right in Figure 7, which shows the same PC familiarity scores as Figures 3, 5, and 6, there is a black spot above the upper whisker, and this is an indication of an outlier. Outliers can alter parametric analyses, and they need to be examined. Statistical analyses may be conducted with and without them. In some circumstances, outliers are removed

Figure 6 Stem-and-leaf plot of PC familiarity scores

Figure 7 Box plots of vocabulary test scores (left) and PC familiarity scores (right)

from the data set, though this is not without its own difficulties. The spirit of honest reporting suggests the researcher explain why outliers were removed. See Larson-Hall (2010, pp. 91–2) and Mackey and Gass (2005, pp. 257–8) for more detail.

Transforming Data

When we conduct parametric statistical tests, to have a bell curve in our data is important because the normal distribution is often required. When an empirical data set is not normally distributed because of skewness or outliers, it may be necessary to transform the data so that the requirements and assumptions of statistical tests can be met. This might sound a little odd, but *transformation* to convert the data into a form which is suitable for parametric tests is perfectly legitimate (Clark-Carter, 2010). For instance, flights from New York to Tokyo that are expressed in terms of “hours” can be transformed and expressed in terms of “speed” as well. The transformation of time data into speed data does not change the nature of the flights.

When a raw data set violates the normality assumptions of a parametric test, *logarithmic transformation* is often used in order to normalize the shape of the original distribution. By

utilizing logarithms of the raw data, larger values can be squeezed and compacted while smaller values can be expanded, and it is possible to reduce the impact of larger values. Other than logarithms, squares, reciprocals, and square roots are also utilized for this type of data transformation (see Clark-Carter, 2010, for details). With the use of SPSS, transformations can be easily conducted. Transformation is a useful tool with which to normalize unevenly distributed data sets, and has its own place in dealing with difficult data. However, it should be also noted that data transformation decreases the obvious meaning of the original data, is not commonly used in modern practice, and is only used when necessary (Cramer & Howitt, 2004).

There is one more concept which should be considered with regard to the normal distribution: *standard scores*. When we have two kinds of data sets, it is difficult to compare them on the same scale. Let us suppose that one student has obtained 60 points on Test A ($\bar{x} = 50$, $s = 10$) and 50 points on Test B ($\bar{x} = 40$, $s = 5$). By looking at the raw scores, one might think that the student did well on Test A. However, this conclusion does not take into consideration the means and the standard deviations of the two tests. In order to make the two tests comparable on the same scale, it is necessary to convert the raw scores into standard scores and compare them. The most basic type of standard score is called *z score*, which is obtained by the calculation formula below:

$$z = \frac{x - \bar{x}}{s}$$

The lower-case z is assigned to this statistic, and a z score has a mean value of 0 and a standard deviation of 1, which indicates that a z score can be interpreted as “standard deviation units below and above the mean” (Van Blerkom, 2009, p. 196). In the case of the above example, the z score for Test A is 1 ($(60 - 50) / 10 = 1$), and the z score for Test B is 2 ($(50 - 40) / 5 = 2$). Therefore, on the basis of the z scores calculated here, we can conclude that the student did better on Test B, even though the raw score of Test B is lower than that of Test A.

Another popular standard score is *T score*, which is calculated by this formula:

$$T = \frac{x - \bar{x}}{s} \times 10 + 50$$

Essentially T scores are the same as z scores, except for the multiplication ($\times 10$) and the addition ($+50$). Since z scores are intuitively difficult to understand, T scores were developed by having a mean of 50 and a standard deviation of 10. The T score for the Test A is 60, while the one for Test B is 70. Standard scores are useful when comparing two scores on different scales when they are normally distributed, though it is important to remember that neither T scores nor z scores change the shape of the original distribution.

Descriptive Linguistics

SOLVEIG GRANATH

Introduction

When people who are not linguists consult a grammar book, it is usually because they want to find out the correct way of expressing something. This is the kind of information many grammars provide. Such grammars are referred to as *normative* or *prescriptive*, or sometimes *teaching grammars*, as this kind of grammar is often used in education. The underlying assumption which such grammars are based on is that rules can be established for the correct usage of a language. Descriptive linguistics rejects this notion of correctness: instead of prescribing how something *ought to be* said, it aims to systematically describe a language as fully and objectively as possible. Accordingly, descriptive grammars can be said to provide systematic descriptions of how the various components of language can be combined into sentences and other units of discourse. In sum, the ultimate object of descriptive linguistics is to describe in a non-judgmental fashion how language is structured.

Descriptive linguistics is often synonymous with *synchronic linguistics*, that is, studying the language at one point in time, and thus contrasts with *diachronic* (or historical comparative) linguistics, which studies and compares language change over time. In American linguistics, *descriptive linguistics* usually refers to mainstream linguistics from the beginning of the 20th century up until Chomsky's introduction of generative theory in the 1950s. Descriptive linguistics is thus not a simple but a multidimensional concept.

Historical Background

The theoretical groundwork of descriptive linguistics was laid by the so-called *structural linguists* in the early 20th century. In linguistics, as in other fields of study such as anthropology, psychology, and literature, structuralism typically involves describing contrasting features in terms of systems or structures. However, it would not have been possible for these ideas to develop and take the shape they did if it had not been for the contributions of philosophers and grammarians in earlier times. A basic assumption about language which has been around from classical antiquity is that language is ordered and regular. Following from this is the notion that words can be divided into classes. This categorization of words is at the very heart of descriptive grammar. In the Western tradition, it goes back to the Greek philosophers Plato and Aristotle. It was further developed by the Stoics, and by the time that Dionysius Thrax wrote his grammar in the first century BC, the parts of speech had been extended from Aristotle's three (nouns, verbs, conjunctions) to eight, which have in the main remained the same until the present day. One legacy from Dionysius Thrax's grammar that still appears in grammatical description is the *grammatical paradigm*, which specifies the inflected forms of words. An example of a verb paradigm in English is that of *be* in the present tense:

2 DESCRIPTIVE LINGUISTICS

<u>Singular</u>	<u>Plural</u>
I am	we are
you are	you are
he/she/it is	they are

In medieval times, as people began to travel more, there was an increasing demand for descriptions of languages. The grammar that served as the model at the time was Priscian's Latin grammar from the sixth century AD. One rather unfortunate consequence of this was that the Latin categories and terminological framework were taken over wholesale from Priscian's grammar and applied to languages that were structurally different. This is especially conspicuous in English grammars from the 18th century, in particular Robert Lowth's grammar from 1762. His is a prime example of a prescriptive grammar in that its aim was to lay down rules of correctness. Lowth's contemporary, the scientist Joseph Priestley, on the other hand, could be seen as a forerunner of descriptive linguists. In his *Rudiments of English Grammar* from 1761, he attempted to lay down rules based on the usage he observed.

The Emergence of Descriptive Linguistics

Linguistics, in the sense of the scientific study of language, started developing in the 19th century with scholars using comparative methods in their attempts to reconstruct Indo-European, the ancestor language of many European and Indo-Iranian languages. This type of study, which involves tracing the historical development of languages over time, is called *diachronic*. It was not until the early 20th century that interest shifted from the diachronic-historical perspective to a *synchronic* one, by which is meant looking at and describing language at one point in time. The change took place almost simultaneously on both sides of the Atlantic, but for different reasons. In Europe, the Swiss linguist Ferdinand de Saussure (1857–1913) gave a series of lectures at the University of Geneva in the years 1906–11, where he introduced the idea of *langue*, the underlying system shared by a community of speakers, as separate from *parole*, the individual act of speaking. The concern of linguists, according to Saussure, should be to describe this system. Another important part of Saussurean theory is that the individual pieces in the system get their values from the other parts that make up the system, rather than from pre existing categories outside the system. Although Saussure himself never published anything on these theories—the book that bears his name (*Course in General Linguistics*) was compiled after his death by two of his former colleagues, based on students' lecture notes—his ideas mark the beginning of structuralist linguistics in Europe. Structuralist linguists are often called “descriptive linguists,” precisely because their concern is to map out and describe various parts of language.

In America, descriptive linguistics began as an outgrowth of anthropology. American anthropologists, under the leadership of Franz Boas (1859–1942), studied Native American cultures, and an important part of this study was the languages spoken by different tribes. The main reason why synchronic (rather than diachronic) methods were used was that the languages these linguists studied lacked written sources, unlike the Indo-European languages, many of which had a written tradition going back a long time. In order to learn about Native American languages, methods had to be worked out for describing them. With no written sources, field workers had to rely on information from the speakers of the various languages. What they would do was ask speakers to name objects, carefully write down the information they received, and make sure they recorded the sounds correctly. As Sampson (1980, p. 64) observes, their guiding principle was “Accept anything a native speaker says in his language and nothing he says about it.” In this way, it was

possible to establish formal ways of determining the sound systems and grammars of these languages.

The foremost representative of American descriptive linguistics was Leonard Bloomfield (1887–1941). After the appearance of his *Language* in 1933, the approach to language in American linguistics became strongly empirical. The idea was that only what could be established objectively was considered reliable. This was in line with the predominant scientific paradigms of the day, those of logical positivism and behaviorism. The descriptivists began by determining what the smallest units of language were and proceeded step-wise to larger units, that is, from phonemes (sounds) to morphemes (parts of words) and (in the ideal model) from morphemes to syntax and utterances. Each system had to be described in its entirety before one could proceed to the next higher level; hence phonemic and morphemic analyses were the chief fields of research at that point in time. In retrospect, it is of course an illusion that each system can be studied independently of the others. For instance, in order to determine what phonemes a language contains it is necessary to take meaning into account, as the method of determining whether a sound is a phoneme or not is carried out by means of minimal pairs. To take an example from English, the minimal pair *pit–bit* shows that *p* and *b* are phonemes in English precisely because the two words have different meanings.

Whereas the Indo-European languages studied by European linguists shared many features due to their having a common ancestor (Indo-European), Native American languages belonged to many different language families and had features that differed radically from one language to the next. This led to the claim by American descriptive linguists that languages are infinitely diverse. These linguists, who based their descriptions on empirical evidence only, were highly skeptical of any pre existing framework for languages such as the Latin one, which had for so long influenced grammatical descriptions of English as well as other languages. The most radical attempt to break away from the Latin tradition can be seen in Fries's *The Structure of English* from 1952. Here, not only did he reject the traditional names of word classes and replace them with numbers, he also based the classification of words exclusively on formal criteria, thus rejecting such notional criteria as "a noun is the name of a person, place, or thing" (Fries, 1952, p. 67). He did this by setting up frames which were used to determine class membership. Accordingly, words belonging to Fries's class one fit into the patterns

(The) _____ is/was good.
 _____s are/were good. (Fries, 1952, p. 78)

His examples—"Coffee is good," "Reports were good"—show that the words of this class to a large extent overlap with the traditional class of nouns.

Descriptive Linguistics after the 1950s

Whereas descriptive linguistics was the predominant approach to language in the first half of the 20th century, linguistic study became more diverse in the second half with the establishment of various schools of linguistics whose approaches to language differed in fundamental ways from, in particular, American descriptive linguistics. In the 1950s, Noam Chomsky introduced *transformational generative grammar* (TG), whose primary aim was to describe the grammatical "competence" of all native speakers, which, according to the theory, makes it possible for them to determine whether or not a sentence is grammatical (see, e.g., Chomsky, 1957). This type of grammar is usually referred to as *formal grammar*. Approaching language from a different theoretical perspective, *systemic-functional grammar*, developed by Michael Halliday (e.g., Halliday, 1985), attempts to account for how language

is used by investigating the choices speakers/writers make in the act of communicating. Of primary interest to adherents of this theory is how language functions in interaction. Modern descriptive linguists, on the other hand, with their empiricist outlook, continue to make use of language data in order to test and refine their descriptions of language. Accordingly, large bodies of data—so-called *corpora*—are collected and investigated in order to explain how a language works. In the early days of descriptive grammar, this work was done manually. Dating from this period are the grammars written by the Dutch grammarian Hendrik Poutsma (published in five volumes between 1904 and 1929) and the Dane Otto Jespersen, whose seven-volume grammar appeared between 1909 and 1949. These impressive works contain numerous examples of authentic language use from all kinds of sources, many of them from earlier periods of English. The majority of these sources were in the form of written texts, and it is written rather than spoken language that has been the primary source of data for descriptive grammars up to the present day.

One of the first large spoken corpora was collected by Fries (see above), whose book *The Structure of English* was based on a corpus of approximately a quarter of a million words of conversation which he recorded himself in the late 1940s (Fries, 1952, p. x). Some ten years later, Randolph Quirk and his team at University College London began the Survey of English Usage. The compilation of this corpus marks the beginning of linguists' efforts to assemble corpora which are as representative as possible of the language as a whole, of a certain variety (e.g., American English, Kenyan English), of a particular genre (i.e., a field of discourse such as fiction, religious sermons, sports reports), or of a register (e.g., casual vs. formal speech). The survey comprised 200 samples of texts of 5,000 words each (i.e., one million words in total), from a large range of domains. It is noteworthy that half of the corpus consisted of speech samples, later published electronically as the 500,000-word London-Lund corpus (Svartvik, 1990). By contrast, the Brown University Corpus of American English, compiled by Francis and Kučera a few years later, consisted only of written samples. It was comparable to the Survey of English Usage in size, but differed in that the number of samples was higher and each sample shorter (500 samples of text, each 2,000 words long). What was new about the Brown corpus was that it was computerized, which made it much easier for linguists to track words, phrases, and grammatical patterns. The latter was facilitated by lexical tagging, that is, each word received a tag at the end, giving information about its word class. The first attempts at tagging corpora were manual (see, e.g., Ellegård, 1978), but soon methods for automatic tagging were developed. In the following decades, corpora from other varieties of English were compiled to match the Brown corpus. At this time, very large corpora designed primarily for lexicography were also compiled. To date, spoken corpora have been underrepresented, as they take much longer to collect and transcribe, not to mention the fact that informed consent is needed from everyone whose speech is made part of a corpus. Still, electronic corpora, which give linguists easy access to a wealth of authentic material, have had an impact both on the content of descriptive grammars as well as on methodological approaches.

Descriptive Grammars

The three most important large-scale English reference grammars today vary in the extent to which they make use of corpus data. *A Comprehensive Grammar of the English Language* (Quirk, Greenbaum, Leech, & Svartvik, 1985), like its predecessor (Quirk, Greenbaum, Leech, & Svartvik, 1972), presents some data from the Survey of English Usage (see above), as well as from the Brown corpus and its British counterpart (LOB, the Lancaster-Oslo/Bergen corpus). Huddleston and Pullum (2002), in their *Cambridge Grammar of the English Language*, also include examples taken from corpora as a supplement to intuitive examples and examples which have been collected from other sources (Mukherjee, 2006, p. 339).

These two grammars can therefore be said to be *corpus-informed* rather than corpus-based, as most of their examples, including sentences which are marked as ungrammatical, are made up by the authors. There is also little mention of frequency of usage. The third big reference grammar, *The Longman Grammar of Spoken and Written English* (Biber, Johansson, Leech, Conrad, & Finegan, 1999) is, on the other hand, *corpus-based*, and information on frequencies and use of grammatical patterns as well as on the patterning of individual lexical items is provided throughout. Of these three grammars, *A Comprehensive Grammar of the English Language* and the *Longman Grammar*, although eclectic in the way they bring together principles from various schools, are basically descriptive, while the *Cambridge Grammar* is heavily influenced by generative theory (see Mukherjee, 2006, for an in-depth comparison of the three grammars).

As Chapman (2006, p. 10) points out, the fact that some approaches to language study are based entirely on observable facts (and for that reason are sometimes claimed to be theory-free) does not mean that they are free from certain underlying assumptions about language. For instance, when it comes to English descriptive grammars, one assumption is that words belong to different word classes; like teaching grammars, the principle of organization in most grammars is word class, each presented in a separate chapter. This is usually followed by a few chapters on clauses and word order. Another assumption is that it is possible to abstract away from the English used in different geographical locations as well as from situated use. Thus, the two large corpus-informed reference grammars mentioned above can both be said to describe English as if it were a unified whole. For this reason, they are sometimes referred to as *monolithic* grammars (Mukherjee, 2006, p. 346). *The Cambridge Grammar* (Huddleston & Pullum, 2002, p. 4) claims to present “Standard English,” defined as “the kind of English which is widely accepted in the countries of the world,” while *A Comprehensive Grammar* (Quirk, Greenbaum, Leech, & Svartvik, 1985, p. 16) sets out to describe the “common core” which is “present in all varieties so that, however esoteric a variety may be, it has running through it a set of grammatical and other characteristics that are present in all the others.” The corpus-based *Longman Grammar*, on the other hand, describes English from the perspective of what the authors refer to as four “core” registers: conversation, fiction, newspaper language, and academic prose (see Biber et al., 1999, pp. 24f.). In addition, features of British and American usage are occasionally compared and contrasted. Also noteworthy is the inclusion of a description of *spoken* English, which was largely ignored (or given very little room) in earlier grammars. Here, Carter and McCarthy’s corpus-informed *Cambridge Grammar of English* from 2006 should also be mentioned, in that it devotes a separate section to spoken language, coupled with a section on how usage varies depending on the social context.

A radically different methodological approach to data is referred to as the *corpus-driven* approach (Tognini-Bonelli, 2001). Whereas the starting-point for corpus-based studies is the linguist’s intuitions or hypotheses about language patterns, corpus-driven research leaves it to the computer to find strings of words with high frequencies of occurrence. This kind of study is therefore *inductive* and focuses on how words combine—*collocate*—with other words to form phrases. One insight gained from corpus-driven methods is that speakers rely more on predetermined combinations of words than was previously thought. Sinclair (1991) refers to this as the *idiom principle*. People follow the idiom principle when they use a set phrase like *of course*. This contrasts with the *open-choice principle* which, as the name implies, gives speakers an option, so that after *of*, they may choose to use any of a number of words (such as *a/the/my/theirs*, etc.). Corpus-driven research has generated a new type of grammar, the *lexical grammar*, an example of which is *Pattern Grammar* by Hunston and Francis (2000). Because proponents of this approach claim to make minimal use of theoretical presuppositions, this can be said to represent an extreme pole in the quest for objectivity in descriptive linguistics.

Descriptive Translation Studies

THEO HERMANS

The academic discipline of translation studies is of relatively recent date. While there has been profound and critical thought about matters of translation throughout history, traditionally much of it was ad hoc, evaluative, and concerned with particular genres such as literature or sacred texts. Sustained attention to translation in an academic context did not begin until around the mid-20th century, when, as a result of technological and socio-economic developments, the volume of translations increased substantially, especially in the industrialized world, and consequently the need arose to train professional translators. The first generation of academically trained translation scholars consisted primarily of linguists involved in translator training. In the 1970s and 1980s descriptive translation studies reacted against the prescriptive and exclusively linguistic outlook of that generation. Since then descriptivism has entered the mainstream of translation studies, and has in turn been challenged by more recent approaches.

Although the descriptivist paradigm in the study of translation is neither theoretically nor methodologically united, its main features may be summarized as an interest in translation as part of cultural history, a focus on translations as historical products, a preoccupation with literary translation, the adoption of a broadly functionalist framework, and a desire to contextualize and to valorize translation as a cultural practice.

This entry first explains the emergence of the descriptive paradigm in translation studies and then addresses specific aspects and developments. It concludes with an account of challenges and criticisms.

The Emergence of Descriptive Translation Studies

As early as 1953 John McFarlane, in an essay voicing unhappiness with the relentlessly judgmental nature of translation criticism, suggested that the study of translation might be conceived differently if it focused on empirical data and on explanation rather than on evaluation. The approach he recommended would be “diagnostic rather than hortatory” (1953, p. 93). Analysis, McFarlane proposed, should start from the assumption that “translation is as translation does” and from “an examination of what translation is and can be rather than what it ought to be but never is” (1953, pp. 92–3).

The essay went unnoticed at the time, and translation continued to be considered mostly in terms either of structural linguistics or of source-oriented literary criticism. McFarlane’s ideas were not picked up until the early 1970s, when the Amsterdam-based American translator and researcher James Holmes brought together different groups of scholars in Western and Central Europe and in Israel who were thinking along similar lines. The Czech scholar Jiří Levý had compared translating to decision making in formal games, and sought to understand individual translations as reflecting different national or historical poetics and conventions (Levý, 1969). The Slovak scholar Anton Popovič (1976) viewed literary translation as involving a confrontation between the aesthetic conventions of the donor and of the receptor culture, resulting in inevitable shifts in meaning and expression. In Belgium José Lambert (1985) and André Lefevere (1982) engaged in projects studying translations in their historical contexts. Holmes himself wrote on different ways

in which poetry could be translated and on such things as the temporal gap separating originals and translations. His key contribution was the 1972 essay "The Name and Nature of Translation Studies" (Holmes, 1988, pp. 67–80), in which he proposed a name for the discipline, that is, translation studies (rather than, say, translatology), and surveyed its various branches, emphasizing the primacy of theoretical and descriptive research and relegating practical applications, criticism, and translator training to a secondary position. Meanwhile in Israel Itamar Even-Zohar (1978; revised 1990) was developing a stratified theory of literature as a "polysystem" that would be able to accommodate traditionally marginalized phenomena such as popular fiction, children's literature, and also translated literature. Another Israeli, Gideon Toury (1980; revised 1995), was attempting a general theory of translation from an explicitly empirical viewpoint.

Personal connections were forged during a series of small-scale conferences held in Belgium and Israel in 1976, 1978, and 1980. They gave rise to what Diana Crane (1972) has called an "invisible college," an international network of like-minded researchers. A collection entitled *The Manipulation of Literature: Studies in Literary Translation* (Hermans, 1985) presented the descriptive approach to the wider community as a new paradigm, complete with a programmatic introduction and case studies.

Descriptivism was by no means the only innovation in translation studies in the 1970s and 1980s. In Germany Katharina Reiss and Hans Vermeer (1984) developed a strongly functionalist view of translation as an alternative to the dominance of linguistically inspired approaches. These were themselves undergoing what Mary Snell-Hornby (1986) termed a "pragmatic turn," more concerned with actual language use than with abstract linguistic structures. In the mid-1980s a group of researchers at the University of Göttingen began to produce a series of detailed studies geared primarily to literary translation into German from the 18th century onwards; they termed their approach "descriptive-historical," and engaged in a critical dialogue with the descriptivists gathered under the "Manipulation" banner (Schultze, 1987; Frank, 1989; Kittel & Frank, 1991; Kittel, 1992; Lönker, 1992; Poltermann, 1995).

Translation and Description

Since descriptivist researchers were keen to engage with actual translations, they did not want to waste time on attempts to define translation. James Holmes (1988, pp. 23–5) invoked Wittgenstein's idea of family resemblances to suggest the flexibility and open-endedness of concepts of translation across cultures—an idea that recently has been revived as a way of exploring translation in a global context (Tymoczko, 2007). Gideon Toury sidestepped the problem of definition by declaring that translation was whatever was regarded or accepted as translation in a given community at a particular time (1980, p. 43). Although this was a nominalist stance that begged more questions than it resolved, it meant that research could get underway without being paralyzed by issues of definition and delimitation.

Strictly speaking the descriptive label was a misnomer. It caught only one aspect of the new paradigm: its opposition to a prescriptive approach and, consequently, its unwillingness to evaluate translations. But descriptivism was more than that. It insisted on the study of translation as a discipline in its own right, regardless of possible applications in translator training, and despite the indifference of most literary studies to translated literature. At the same time, descriptive researchers were intent on doing more than merely describing. They sought to contextualize and to explain; some even wanted to arrive at predictions and generalizations, on the model of the sciences. Most, however, were content to engage with the history of translation and to develop methodological tools to do so.

Harald Kittel formulated the guiding questions for translation research as “*who translated what, when, why and in what way, and why in this particular way?*” (Kittel, 1988, p. 160; Frank, 1989, p. 6). At the methodological level several techniques designed to capture and tag the relation between originals and translations were tried and tested, but all ran into problems due to the need to interpret rather than merely log meanings, forms, and translation shifts.

Despite these hermeneutic difficulties, a great deal of historical research, much of it focused on literary texts and their translations, was generated. As a result, traditional concepts like that of equivalence were questioned, and attention turned instead to the conditioning factors of individual translations and the impact of translations on their environment. As the discipline gained academic respectability and project funding became available, larger bodies of work could be investigated. Looking at series of translations over longer periods rather than as isolated cases revealed regularities and patterns in the work of individual translators or of particular groups, periods, or genres. The concept of translation norms, which Levý and Popovič had already employed and Toury elaborated further, proved useful as a means of accounting for the preferential choices which translators appeared to make again and again. Beyond the concept of norms lay the value systems binding collectives together. The significance of the concept of translation norms, then, consisted not so much in the role of norms as constraints limiting the individual translator’s freedom of action, but rather in the window they opened for researchers to gain insight into the conditioning of translation in different social, cultural, and ideological contexts.

This meant a widening of the horizons of translation studies, and the importance of descriptivism for translation studies lies in its contribution to these intellectual developments. One line of inquiry led to the historicizing of translation concepts and practices, and hence to a recognition of their diversity, contingency, and historical embedding. Whereas some early descriptivist studies entertained hopes of formulating universal, immanent laws of translation, the historicizing of translation pointed in the opposite direction and suggested an understanding of translation as a cultural construct bound to specific communities, times, and locations. The principles governing the encounter with historically remote periods could subsequently be projected onto studies dealing with translation across geographical and cultural divides (Hermans, 2006).

Parallel to the engagement with history there was a branching out into other forms of translation, including interpreting and audiovisual media. Here, too, early work had tended to be prescriptive or, in the case of interpreting, concerned with linguistic and cognitive factors. The focus gradually shifted to a consideration of contextual elements and questions of agency (Esselink, 2000; Pöschhacker & Shlesinger, 2002; Díaz Cintas & Remael, 2007).

Another line led to the role of moral, political, religious, and other factors that shape the production and reception of translations. This type of work was instrumental in bringing about what was called, in 1990, the “cultural turn” in translation studies (Bassnett & Lefevere, 1990). The cultural turn resulted not only in a contextualization of translation as a social and cultural practice, but also in an outlook that saw translation as just one practice among other forms of transmission and migration of cultural goods. Symptomatic in this respect was the work of André Lefevere, who in the course of the 1980s abandoned Even-Zohar’s idea of a literary polysystem and its formalist and structuralist ambience, and instead developed his own theory of what he called “rewriting” (Lefevere, 1992). The term covered a broad swathe of phenomena from anthologizing to criticism, in addition to translation. Lefevere’s emphasis on patronage and ideology in the historical manifestations of various kinds of rewriting brought into view larger social networks as well as political factors and power differentials. This emphasis aligned with postcolonial studies, with studies stressing the role of translation in shaping cultural identity, and with the burgeoning sociology of translation.

4 DESCRIPTIVE TRANSLATION STUDIES

Although corpus-based translation research has not worked with the concept of norms in any significant way, its approach is entirely compatible with the descriptive paradigm, and indeed corpus-based studies often position themselves as an extension of descriptive work. Much early corpus-based research, whether it used parallel or comparable corpora (i.e., sets of translated and untranslated texts, or pairs of originals and their translations), was intent on discovering patterns and regularities within or across genres. More recently questions of style, evaluation, and point of view have also been explored with the use of corpus tools (Olohan, 2004).

Just as working with large computerized corpora led to new and different questions being asked, so the widening of horizons which descriptivism brought about in translation studies led to its transformation. As it began to tackle not just literary printed texts but audiovisual media, and as it spread beyond Europe and North America, its complexion changed. What was once a limited, distinct paradigm defined by its opposition to prescriptive studies and evaluative criticism has become a mainstream direction in translation research. While descriptivism broadened and deepened, it also absorbed criticism, primarily from postcolonial and deconstructive angles (Niranjana, 1992; Hermans, 1999). Deconstructive critics attacked descriptivism's neat separation of object-level and meta-level, and the illusion of value-free research. Postcolonial scholars pointed out the descriptivists' initial blindness to questions of power, the restriction to Western canonical literature, the unthinking application of Western theoretical models to other cultures, and the failure to recognize that the study of translation, like translation itself, was an ideologically conditioned cultural practice. These debates continue. However, they are now no longer about descriptivism as such; they concern the study of translation as a self-reflexive discipline in a global context.

Determining Language Proficiency in Legal Contexts

MARGARET VAN NAERSEN

In any legal case the nature and quality of evidence is critical. When there is an allegation of illegal activity by someone who is not a strong speaker of a language, proficiency in the language of the legal system is of concern. There are special challenges when language evidence involves non-native speakers (NNSs) (Eades, 1995, 2003).

Appropriate language assessment can be a valuable tool in legal cases involving NNSs. The focus here is on criminal cases. Three areas are covered:

1. contexts and selected concepts,
2. language assessment and legal questions, and
3. specific assessment concerns.

Other NNS issues are not included.

Language assessment is a discipline within applied linguistics. In legal cases experts may be called in to examine language evidence and possibly testify in court. In some legal systems experts are hired by one side in a case; in others by the court.

Setting the Stage: Contexts and Selected Concepts

In this section, three contexts are presented to suggest a potential range of NNS cases. These are followed by six concepts which are introduced to show their relevance in NNS cases.

Contexts include (a) alleged criminal activities, (b) interactions with law enforcement, and (c) case preparations and trials. First, with NNS communications (oral or written) in alleged criminal activities, key concerns include (a) the ability to understand enough to be held responsible for a decision to participate (or not) in alleged criminal activities, and (b) the ability to make one's self understood accurately enough that meanings and intentions are clear (Shuy, 2005).

Second, in law enforcement communications key concerns include the ability to (a) accurately make one's story understood during pre-arrest interactions, (b) understand rights when given a police caution or during a search request (Briere, 1978; Ainsworth, 1993; Shuy, 1997; Cotterill, 2000; Nakane 2007), (c) accurately make one's story understood during law enforcement interviews (Russell, 2002), and (d) understand details of formal statements resulting from law enforcement interactions (Jensen, 1995). Language evidence from these include police reports, confession statements, and recordings of communications with law enforcement (see Coulthard, 1996; Rock, 2007; also see, e.g., Berk-Seligson, 1990; Gonzalez, Vasquez, & Mikkelsen, 1991; Cooke, Eades, & Hale, 1999; Carter-Balske, Kay, & Ramirez, 2007.)

Third, in communications during case preparations and trials, concerns include (a) the adequacy of legal counsel without an interpreter (Cooke, 2002), and (b) the ability to accurately make one's own story understood during preliminary hearings and trials.

2 DETERMINING LANGUAGE PROFICIENCY IN LEGAL CONTEXTS

A key concern in all areas (contexts) is whether communications reflect truthful or deceptive language proficiency—either by a defendant to gain advantage in alleged criminal activities and legal proceedings, or by a native speaker pretending to be a NNS. Another concern with NNSs is their knowledge of and ability to understand legal proceedings: this can affect communications (Pavlenko, 2008).

Six key concepts are reviewed here to show their relevance in NNS cases: *language evidence*, *language sample*, *linguistic evidence*, *language proficiency*, and the assessment concepts of *reliability* and *validity*.

Language evidence includes written and recorded oral communications from, for example, law enforcement stops and requests to search, interviews, and wiretapped communications. In NNS cases two special areas of concern are (a) written transcripts of audio recordings and (b) oral evidence produced under questioning.

First, because transcripts of audio recordings of interactions can have many problems, in some legal systems transcripts are not considered *direct* evidence. Omissions of nonverbal features and pauses, inaccuracies, and other problems can significantly change meanings. Transcribing accurately can be especially challenging when speakers are NNSs. Transcripts are tools, but frequently inadequate, and must be used with caution. (Some sources on transcription concerns include Walker, 1986 and Shuy, 1998.)

Second, much has been written on questioning strategies in court, especially adversarial strategies. Similar strategies may occur in law enforcement interviews. Responses can become additional language evidence. When a NNS is recalling and reporting past events, references are more abstract than when communicating about the concrete “here and now.” More advanced language skills are needed (see Cummins, 1981, on basic interpersonal communication skills and cognitive academic language proficiency; Halliday, 1994, on *ideational language* and *interpersonal language*). Additionally, NNSs may lack the confidence and language skills to communicate accurately under adversarial questioning. Also, court settings and the language can affect responses.

Language sample, in assessment contexts, refers to any oral or written language that becomes the subject of analysis to provide insight into the language proficiency of an individual. Language samples range from spontaneous communication to language produced under tightly controlled conditions, of very limited length, and with a narrow focus. In forensic contexts, language samples are the pieces of language evidence, and if of adequate length, may also provide insights on language proficiency.

Linguistic evidence is described here both to show its role in language assessment and that it is not the same as language evidence. When the findings of *analyses* of language evidence (including assessment data) are grounded in principled linguistic theory and practice, they become linguistic evidence. This evidence may assist the fact finders (judge/jury) who make final decisions in cases.

It is also useful to note what is *not* linguistic evidence. Simply because analysis is based on a *language sample* does *not* mean it is linguistic evidence. Useful information can be found in language samples, for example, in analyses of content: eye witness accounts might contain descriptions of what was heard or smelled, providing clues on truthfulness of eyewitness accounts to experts in that field. Also, native speakers may feel they can judge another person’s language, but anecdotal evidence by a nonlinguist, giving impressions about a person’s language skills, is *not* linguistic evidence.

Language proficiency “refers to the degree to which the student exhibits control over the use of language, including the measurement of expressive and receptive language skills in the areas of phonology, syntax, vocabulary, and semantics and including the areas of pragmatics or language use within various domains or social circumstances” (US Department of Education, Office of Civil Rights, *n.d.*). “Student” also refers to NNSs.

Reliability and *validity* are key concepts in language assessment. Experts in language assessment frequently deal with large examinee populations, thus, are concerned about the reliability of a test, its potential to produce similar results under similar conditions. In some legal systems, the rules of evidence promote reliability standards. They are seen as “scientific” means of evaluating both an expert’s field and procedures. However, in legal cases, there is almost always only a single subject. Legal questions usually involve specific communicative events. These frequently are *not at all* similar to tasks commonly found on standardized tests: using a multiple-choice English grammar test is not valid for testing someone’s ability to interact in a police interview. Thus, *reliable* tests might lack *validity* in a specific case. While some standardized tests may provide data of limited appropriateness, additional, more valid tasks might strengthen arguments. Experts may also need to demonstrate that validity is also a key assessment concept and may, in fact, override reliability rates.

Language Assessment and the Legal Question

When concerned with language proficiency in legal contexts, keeping an eye on the legal and linguistic questions is critical (see Figure 1). A preliminary examination of language evidence and background information can (a) help determine whether additional language evidence is needed, and (b) suggest language assessment tasks valid for the communicative events. This example shows how a legal question drives analyses of formal language evidence and additional language assessment data. Several areas of expertise were needed: conversation analysis, language assessment, and second language acquisition.

The Legal Question is: *Did the defendant, Mr. C, conspire with Mr. X to bomb an office building?* Law enforcement had planted recording devices: the recorded evidence suggested a possible conspiracy. Clarification of the legal term “conspire” provided linguistic implications. Addressing the Legal Question, a linguistically based question was posed, for example, *Using the language evidence, is there linguistic evidence that Mr. C understood the relevant conversations and agreed with plans to bomb the building?* Specific questions were used for analyses, including these: *Are the conversations coherent? Are there communication breakdowns?* A topic analysis of the conversations helped determine whether speakers were talking about the same or different topics. *Who initiates talk about what topic?* (Shuy, 1998). Then, remembering the word “conspire” in the Legal Question, a narrower question was asked: *Is the defendant only talking about repairing cell phones while the other person is talking about adding an explosive device to cell phones?* Then, as the defendant was a NNS, the expert asked: *Is there any linguistic evidence that Mr. C did/did not understand the other speaker’s agenda?*

The expert determined that proficiency assessment could provide insights on the likelihood that Mr. C *did/did not* understand key communications. An appropriate oral interactive

Figure 1 Identifying need for language proficiency support

proficiency assessment was done. Data from the formal evidence and the language assessment were analyzed. Mr. C's language use was also examined for consistencies in language development patterns, thus, considering the possibility that Mr. C was pretending weak language skills.

The analyses are then linked logically to the linguistic and legal questions. These *analyses* become linguistic evidence, which is reported to the attorney to use in determining a strategy. Later the linguistic evidence might be presented to the fact finders (judge/jury) to assist them in answering the Legal Question. However, it is beyond the scope of the expert to directly answer the Legal Question, even when efforts are made to trap the expert into doing so.

In legal contexts the purpose of language assessment has frequently been seen as simply providing a test score and a general opinion. However, there is danger in jumping from a test score to a legal question without developing connections. This is supported by the language testing field with a simple, but important logical process that parallels legal argumentation: evidence argumentation. This process considers the relevance of data and the value of the observations as evidence, including validity in testing (see Mislevy, Steinberg, & Almond, 2003; Bachman, 2005; McNamara & Roever, 2006; van Naerssen, 2009).

Experts report any limitations of assessment procedures and findings to the attorney. They also prepare for possible criticisms in court: while no test is perfect, a single criticism, not intelligently responded to, can destroy a carefully designed assessment effort. Also, language myths held by the fact finders can interfere with efforts by an expert to address the proficiency of a NNS (van Naerssen, 2007).

Selected Assessment Issues

Several important assessment issues are: locating the language analysis focus, truthfulness of language performance, audio-taping concerns, development of valid assessment tasks, and maintaining distance in reporting.

First, an expert distinguishes which language is being evaluated in each analysis. Is it the language of the NNS? Is it the language of the input, for example, a written confession statement or recordings involving conversations? Then, what is the likely ease or difficulty for the NNS interacting with this other language input? Also, how long ago was the language produced? Often in assessment the focus is on current abilities, progress over time, or predicting potential. In legal contexts, the primary focus is usually retrospective. The expert also has no control over the quality of language evidence already collected. Thus, aside from recordings/transcripts, examiners can only assess the language of the NNS in the present time. The expert might cautiously project back in time (a) to ask how likely it is the proficiency of the NNS could have significantly improved, and (b) to consider the ease or difficulty a NNS, at a specific proficiency level, might have had with the relevant communications.

Second, in cases involving language proficiency issues, the possibilities of both truthful and deceptive performance should always be considered. Experts in language acquisition, sociolinguistics, and assessment usually can detect consistencies and inconsistencies. If language performance is truthful, analyses usually reveal substantial consistencies; if deceptive, inconsistencies are likely to occur. It is highly *unlikely* that a person could successfully deceive (or intentionally underperform) throughout lengthy samples of unplanned communications at different times (van Naerssen, 2007; O'Laughlin, 2009; English, 2010). When formal language evidence is limited, additional language samples, through language assessment, can help compare performance.

Third, audio recordings of oral testing are invaluable for analyzing patterns of language use and evidence of developmental levels. Fourth, while an expert may determine additional, more valid assessment is needed, it is not appropriate to simulate aspects of the alleged criminal activity. However, a simulation of a similar task could be done with different content.

Lastly, experts' statements are cautiously framed as probabilities about NNSs communicating at a specific proficiency level. They avoid stating that *because* a person scored at a specific level, that person *could/could not* have understood certain communications. A generalization (not naming the defendant) can be made, for example, "Based on the language evidence, it is highly *likely/unlikely* that a person with these tested abilities would have been able to successfully communicate in *x* activities."

Dialogic Inquiry and Teacher Talk in Second Language Classrooms

MARI HANEDA AND GORDON WELLS

The Case for Dialogic Inquiry

A sociocultural approach to language and literacy emphasizes the need for students to be actively engaged in jointly undertaken activities that involve the co-construction of knowledge through dialogue with teacher, texts, and peers. For it is through dialogue that students clarify, modify, and extend their understanding of curricular content as they attempt to formulate their thinking in speech, writing, and other modalities. Furthermore, it is through their engagement in such discursive practices that students appropriate the knowledgeable skills that these practices involve, including the use of the language registers specific to the different subjects of the school curriculum. Thus, in order to develop language competence and subject-matter knowledge, all students, but particularly second language (L2) learners, need to have many opportunities to participate in semiotic practices that promote both higher-order thinking and the use of a range of language functions, such as formulating questions, reasoning, and explaining. Nevertheless, as numerous studies of classroom discourse have reported, such dialogic interaction is still not the norm in practice. The question is therefore how to create opportunities for productive dialogue in the classroom.

The basis for an answer to this question was put forward early in the last century by Dewey (1938) when he argued that, instead of being treated as passive receivers of information, students should be encouraged to be active inquirers about issues arising from their own experience. The adoption of such an orientation to curriculum is almost certain to generate occasions for dialogue, for when students actively engage in investigation of an issue that is of interest to them, they naturally want to share what they have discovered. And, since they often arrive at different proposed solutions, there is an evident need for dialogue. For this dialogic inquiry (Wells, 1999) to be productive, however, certain conditions have to be met:

- The class engages in a shared inquiry about an issue which is, or becomes, of interest to all participants.
- Individual students must have relevant ideas, opinions, or experiences that they want to share.
- Others must be willing to listen attentively and critically and be able to discuss whether, and in what ways, different contributions are relevant.
- The teacher must share control and the right to evaluate with students.

In sum, what is needed is the creation of a classroom community of inquiry in which everyone feels safe to make contributions in the knowledge that their ideas will be taken seriously and responded to accordingly. For L2 learners this is particularly important, for when they know that what they have to say is more important than the language forms in which they express it, they are willing to take risks and, as in the case of infant learners

of a first language, to learn how to talk from participation in conversation in which both they and their more expert interlocutors are dialogically engaged. However, as Alexander (2006) notes, in the classroom such dialogical engagement needs to be deliberately nurtured by the teacher helping students to listen to and build on each other's ideas in order to co-construct coherent lines of thinking with specific purposes in view.

It is important to stress that an emphasis on dialogue arising from students' inquiries does not mean that academic language and the registers of the different disciplines are neglected, for not all the different activities that are called for by the teacher's pedagogical goals are open-ended. For instance, when introducing a new topic or concluding a lesson, the teacher may use a more monologic discourse genre such as a mini-lecture to prepare her or his students for the activities to follow or to recapitulate the main conclusions drawn; students also encounter these academic registers as they read and write about the topics being studied. However, by adopting an overall orientation to collaborative inquiry, the teacher ensures that all activities allow for dialogic interaction in which students both develop their understanding of key concepts and appropriate the language for talking about them.

An Example of Dialogic Inquiry

In this section, we provide an example of dialogic inquiry, which is taken from an action research study by the second author in collaboration with a fourth grade teacher in California who had a large number of English language learners (ELLs) (Ball & Wells, 2009). Over a four-year period, this research tracked the annual enactments of a 10-week science unit in which students competed to make and improve vehicles so that they would travel as far as possible when released down an inclined plane. The typical lesson involved three phases: recapping progress to date, leading to a decision about the focus for the next practical investigation; a period of making modifications to vehicles and testing their effects; and, finally, a discussion of what had been discovered.

Particularly important was the teacher's combination of hands-on activities and second-hand investigations, which involved the reading of texts that reported other people's research (Palincsar, Magnusson, Collins, & Cutter, 2001). In this class, this took the form of a research notebook kept by Cynthia Clarke—a fictitious university student—who had observed skateboarders traveling down ramps. Opening the project by reading the questions Cynthia had recorded in her notebook, the teacher immediately engaged the students' attention as, familiar with skateboarding, they vied in offering possible answers and these, in turn, prompted questions and possible solutions for their own investigations of cars on ramps. Thus, it can be said that, by building on ELLs' lived experiences outside school, the teacher was able to engage the students in learning key concepts in the physics of motion as they used them in dialogic interaction to advance their practical investigation and to engage in related literacy activities.

This engagement led students to come to understand and use some of the key scientific concepts involved, such as "force," "gravity," "friction," and "momentum," in trying to explain the ways in which their cars functioned. At the same time, the whole class discussions met the criteria, described earlier, for dialogic inquiry. Particularly important in creating this form of dialogue was the teacher's way of leading the discussion. He encouraged students to initiate sequences of talk by offering conjectures and tentative explanations, while his own contributions consisted almost equally of open-ended questions and informative comments that moved the discussion forward; when following up on students' answers, he typically showed "uptake" (Nystrand, 1997), either by asking for further relevant information or by himself expanding on what they had said.

Implications of Dialogic Inquiry for ELLs

Participation in dialogic interaction is particularly important for school-aged ELLs for a number of reasons. First, as a means of encountering the additional language in use, it provides not only “comprehensible input” (Krashen, 1985) but also opportunities to learn how to engage in the genres of the different academic disciplines so that the learners may become academically competent participants (Schleppegrell, 2004). Additionally, when they are encouraged to participate in the co-construction of curriculum knowledge, ELLs are likely to have opportunities to produce longer and more complex contributions, namely “comprehensible output” (Swain, 2005). At the same time, as they participate in the ongoing discussion, ELLs are more likely to encounter varied perspectives on the topic under discussion, expressed by students as well as the teacher. Such opportunities to listen to multiple viewpoints expose them to diverse language models (Warren, Ballenger, Ogonowski, Rosebery, & Hudicourt-Barnes, 2001). Thus, in using their language resources to contribute to the ongoing classroom interaction, they simultaneously learn the social and communicative strategies needed to access and communicate the academic content. Furthermore, when ELLs are given significant interactive roles, they become recognized as legitimate members of the classroom community (Haneda, 2008). In other words, since interaction determines the nature of the co-membership students experience within the group, the identities they develop as particular kinds of person within the classroom community depend on the interactive roles they take on or have assigned to them in the course of dialogic inquiry.

Dictionary Use

HILARY NESI

Introduction

Dictionaries are tools which people use to access information about words. Their purpose is to provide “user-adapted access to data” (Leroyer, 2009, p. 113), so they must contain information that is relevant to users, and they must also have an access system to enable that information to be retrieved. The choice of information to include in a dictionary reflects the dictionary maker’s beliefs about dictionary users’ wants and needs, and the design of the access system reflects the dictionary maker’s beliefs about the dictionary users’ purposes, circumstances, and skills. These beliefs are not always made clear to users, however, and studies of dictionary use often reveal tensions between users’ beliefs about the types of dictionary they should use and the types of dictionary they actually prefer to use, as well as ignorance regarding the range of dictionary types and the various features of dictionary access systems.

“Users in general never need information in general” (Tarp, 2009, p. 46). The type of information that a user needs will always depend on the type of user and the type of situation in which the need occurs. Applied linguists should be aware of the different types of dictionary user and dictionary using situations in order to inform their practice as dictionary designers, dictionary reviewers, and teachers of dictionary skills.

Different Types of Users

Dictionary users vary in terms of their familiarity with the target language, their familiarity with the specific registers of that language, their dictionary-using skills and experiences, and their educational level and scientific and cultural knowledge.

Bilingual Dictionary Users

Users of dictionaries in their own mother tongue and users of dictionaries in a second or foreign language have different needs. Most surveys of language learners’ dictionary use, for example Atkins & Varantola (1998), Komuro & Yamada (2000), and Wingate (2002), have found that learners prefer to use bilingual dictionaries. This is especially true of low proficiency learners, because they are less likely to know second language (L2) word forms and are less likely to be able to understand L2 entries. Some bilingual dictionaries provide very detailed information, however, suitable for advanced learners or professional translators. Language teachers often encourage learners to use monolingual dictionaries because they believe them to be of better quality and more conducive to language acquisition. Bilingual dictionaries are sometimes thought to foster the false impression that there are exact translation equivalents for all words in one’s native and target language and some have been criticized for their failure to provide appropriate translations (e.g., by Laffling, 1991). User studies suggest that “bilingualized” dictionaries which provide an L2 definition and a first language (L1) translation may be more effective than either monolingual and bilingual dictionaries (Laufer & Kimmel, 1997), but such dictionaries do not yet exist in all the major languages and are rarely found in electronic form.

2 DICTIONARY USE

Many electronic dictionaries offer the opportunity to search multiple monolingual, bilingual, general, and specialized dictionary sources simultaneously. The bilingual components in these compilation dictionaries often contain mistranslations, yet they are widely used in many countries. The publishers of the *Kingsoft PowerWord* translation tool for English and Chinese, for example, claim that it has over 20 million users. Highly reputable monolingual dictionaries such as the *Concise Oxford English Dictionary* and the *Oxford Advanced Learner's Dictionary* are included in some electronic dictionary compilations, particularly those for handheld devices (pocket electronic dictionaries). Their inclusion helps to sell the product, but there is evidence to suggest that users rarely consult them and tend to rely on the bilingual sources instead (Nesi & Boonmoh, 2009).

Monolingual Dictionary Users

Large multivolume monolingual dictionaries, such as the *Oxford English Dictionary*, the *Dictionnaire de l'Académie française* for French, and the *Diccionario de la Lengua Española de la Real Academia Española* for Spanish, contain a great deal of historical information for language scholars, but are not really intended for general everyday use. Surveys have found that nonspecialists tend to use L1 dictionaries to check the meanings, spellings, or hyphenations of less common words (Jackson, 1988; Ripfel, 1990), so smaller general-purpose dictionaries which focus on current usage generally suit them better. The desk-sized general purpose dictionary is commonly treated as a highly authoritative source of language information, and even when such dictionaries aim to be descriptive rather than prescriptive they are used to provide proof of the correctness of given forms and usage. Such dictionaries are also consulted for evidence of a word's existence in the language, for example whilst playing word games (Quirk, 1973).

Compared to monolingual general-purpose dictionaries, monolingual dictionaries for language learners provide more help with grammar, pronunciation, and usage, and use simpler defining language. The compilers assume that language learners need more information about how to use words correctly, so the dictionary space that might have been used to define rare words is used to treat a smaller number of common words more fully, including, for example, information about collocations, word frequency and register, and more extensive illustrative examples. This difference between native speaker and learner dictionaries was more marked in the past, because many of the innovative features that were first introduced to help language learners, such as usage notes, corpus-based examples, and writing guide sections, are gradually being included in mainstream L1 dictionaries, while the coverage of learners' dictionaries tends to increase with each new edition. Extended coverage is a common selling point for publishers of all types of dictionaries and reviewers commonly treat this as a mark of quality, to the exclusion of other considerations such as the purpose and design of the dictionary (Nielsen, 2009).

Some learners habitually use general-purpose monolingual dictionaries rather than learners' dictionaries (Nesi & Haill, 2002), either because of the greater coverage, or because they are unaware of the differences between the two dictionary types. Publishers tend to give little indication of the type of user their dictionaries are primarily intended for, because they want to appeal to as wide a market as possible. This can give rise to confusion, and online book-purchasing sites sometimes include customer reviews warning language learners against buying certain L1 dictionaries because they do not contain sufficient language support, for example regarding the pronunciation of common words.

Younger Dictionary Users

Further distinctions can be made between users of different ages. Compared to desk-sized general-purpose dictionaries, dictionaries for children are smaller in size, with larger fonts

and reduced coverage. Like learners' dictionaries they tend to make use of illustrations for words whose meanings can be visualized, but which require complex language to define. In some dictionaries for young children pictures replace definitions entirely, and these might appear to be equally suited to non-native speakers in the early stages of learning a foreign language. In fact, however, dictionaries for native-speaker children often illustrate the meaning of words that the children already know, at least partially. In this case the pictures may be too imprecise to be useful to language learners who have never encountered the words before.

Alternative Dictionary Designs

All kinds of dictionary users are sometimes faced with the problem that they know the meaning but not the form of the word they want to find. Thesauruses are designed to help users in this respect, by grouping words into searchable conceptual categories. Visual dictionaries such as those in the *Oxford-Duden Pictorial* dictionary series are also organized conceptually and are particularly useful as a means of explaining technical terms for objects that can be visualized. Another approach to the same problem is provided by learners' dictionaries, such as the *Longman Language Activator*, which help users with limited vocabularies by listing as headwords only the basic words that they are most likely to know and suggesting in the entries for these words alternative forms with more specific meanings. Electronic dictionaries which enable searches for words within entries can perform a similar function, by showing which words are defined using the basic words the user has in mind.

Different Types of User Situation

According to Tarp (2009), dictionary users' needs are always "punctual" in that they are concerned with filling an immediate knowledge gap. In this they differ from other types of learning material such as textbooks which provide information to be learnt as part of the systematic study of a given topic. It might be argued that users sometimes approach a dictionary in order to memorize words and their meanings, using it as a 'learning dictionary' rather than as a "consultation dictionary" (Hausmann, 1977, p. 144). Tarp points out, however, that when this happens dictionaries "lose their distinctive nature as reference works" (2008, p. 46).

Cognitive Situations

In "cognitive" situations (Tarp, 2008) the user simply wants to use a dictionary to gain new knowledge. This situation can occur in many different social contexts, with any kind of dictionary, although the search functions in electronic dictionaries seem to make it particularly easy for users to browse dictionary information and store their findings for later review. Many online dictionaries enable users to 'jump' from entry to entry by clicking on words in the definition, for example, and some also provide facilities for copying entries and creating and annotating lists of words.

Communicative Situations

Communicative situations, on the other hand, occur when dictionary use is motivated by problems with language reception (while reading or listening), or production (while writing or speaking). In these situations users want to find the information they need as quickly as possible, with as little disruption as possible to the communicative activity.

Opinions are divided as to whether it is fair to allow dictionaries in foreign language examinations. Some argue that dictionary access might encourage cheating, especially in the case of electronic dictionaries which offer multiple additional information sources. The student informants in studies by East (2008) had mixed feelings about the value of dictionary use in examinations. It made them feel more confident, but they also thought that it took up valuable time. Whether using a dictionary can help candidates gain higher marks probably depends on the nature of the examination and on the candidates' dictionary-using skills.

Several studies have found that users often misread dictionary information and end up with a false or incomplete notion of word meaning and use. A variety of reasons have been given for this, for example that they pick out familiar words from the definition without referring adequately to the context (Miller & Gildea, 1985), or they have difficulty selecting the correct subentry, because they choose the first in the list, or mistake the word class of the search word (Nesi & Haill, 2002; Nesi & Boonmoh, 2009).

Dictionary Choice

The user's choice of whether to use a large or small print dictionary, an online dictionary, or a pocket electronic dictionary should be influenced by the purpose of the consultation and the physical circumstances of dictionary use. An online dictionary may be the best choice whilst word-processing an essay, for example, but the same user may prefer a print dictionary when reading a novel for pleasure.

Traditionally monolingual dictionaries have been oriented toward receptive rather than productive use, so the earliest learners' dictionaries were very innovative in the way that they provided pronunciation, grammar and usage information for writers and speakers. L1 dictionaries are now beginning to include these features too (see above).

Print-dictionary consultation is too slow for conversational needs and only the smallest are easily portable, so in the past dictionaries were not widely used to support speaking and listening. Pocket electronic dictionaries are much more convenient in this respect and studies report on their use by students when listening to teachers in the classroom, often also noting the teachers' disapproval of this kind of use (Stirling, 2005). Pocket electronic dictionaries with audio functions can even help users take part in conversations, by pronouncing difficult words.

Typically, dictionary skills are thought of as the skills needed to look up words and interpret dictionary entries. However, there is a strong case for also teaching users about the range of dictionaries on offer, and encouraging them to critically evaluate the advantages and disadvantages of different dictionary choices.

Discourse Analysis and Conversation Analysis

MEREDITH MARRA

Discourse analysis (DA) is an umbrella term which refers to a range of qualitative frameworks used for the empirical examination of language in use. The many different approaches covered by the term have diverse theoretical underpinnings, have a variety of disciplinary origins, and make use of distinct methodologies and tools. Within applied linguistics, there are a range of approaches to the analysis of talk including conversation analysis (CA), critical discourse analysis, and interactional sociolinguistics, as discussed below. While CA is normally treated as belonging to a category distinct from other DA approaches because of its theoretical assumptions, traditions, and data sources (Antaki, Billig, Edwards, & Potter, 2003; Wooffitt, 2005), DA and CA share the common goal of attempting to understand and interpret social reality as it is discursively (re)produced by interactants in context.

Approaches to the analysis of discourse gained popularity in the 1980s and 1990s in line with a general “discursive turn” in the social sciences (see, e.g., Harré, 1995). Academics across a number of disciplines (including philosophy, anthropology, social psychology, communication studies, management, and linguistics) increasingly rejected the artificiality of experimental design in favor of a more contextualized approach to research. The people under investigation in this research were no longer referred to as *subjects* to be manipulated, but rather as *participants* who were co-producers of their interactional accomplishments. Fixed and given categories such as age, gender, and status were questioned, and emphasis was placed on the way in which these social factors are negotiated within interaction, recognizing the meanings that participants assign in talk as well as the linguistic and discursive mediation of social lives. Discourse is thus understood as “a form of collaborative social action” (Jaworski & Coupland, 1999, p. 49).

A useful way of identifying the scope of discourse is to consider a distinction made by James Paul Gee (1990) following Michel Foucault (e.g., 1990) and Pierre Bourdieu (e.g., 1991). In Gee’s terms, Discourse (written with a capital “D,” that is, big “D” discourse) is used to refer to distinctive and institutionalized ways of thinking and interacting which represent certain values and attitudes and which are also recognized to be representing these; for example, the discourse of rugby or political discourse. Little “d” discourse, by contrast, is the (sometimes mundane) talk and conversations in which we participate every day, that is, language in use. Discourse analysts can focus on either, or indeed both, of these.

In exploring discourse, researchers take coherent stretches of language beyond the word, phrase, or sentence (Schiffrin, 1994), “text,” as their unit of analysis. What is understood as text differs according to the approach adopted, but it is typically naturally occurring data, either spoken or written. While the various types of DA can be sorted according to the text mode (spoken, written, or more recently multimodal; LeVine & Scollon, 2004; Norris & Jones, 2005), or the theoretical underpinnings (e.g., critical vs. functional approaches), others have categorized types of DA according to the disciplinary origins (e.g., McCarthy, Matthieson, & Slade, 2002) or whether the analyst takes a macro- or micro-focus in their approach (e.g., Stubbe et al., 2003). To explain some key differences, three common approaches are described in more detail below. In making this selection, my criterion is

the treatment of context; context is relevant for each, but what constitutes context, and the ways in which the analyst makes use of context, differ.

Conversation Analysis

Within applied linguistics in particular “conversation(al) analysis” has sometimes been used as a somewhat woolly synonym for DA, where “conversations” were regarded as the focus of a more general qualitative approach to analysis. This practice has largely disappeared with the rising popularity of conversation analysis (CA) as an analytic approach within the field, representing a specific school of thought.

CA is the study of “talk-in-interaction,” and analysts are interested in the sequential organization of discourse including both everyday and institutional talk (e.g., ten Have, 2007, Hutchby & Wooffitt, 2008). The approach has developed from pioneering work by the sociologist Harvey Sacks and his colleagues Emmanuel Schegloff and Gail Jefferson (e.g., Sacks, Schegloff, & Jefferson, 1974) and is particularly influenced by the work of Harvey Garfinkel in ethnomethodology. Analysts use extremely detailed transcripts to represent the audio and video recordings of talk which are the primary source of data for analysis. Making use of this detail, the analysis focuses on micro-level linguistic features.

Analysts who take spoken discourse as their focus require a way of representing this data. When transcribing, researchers use certain conventions to represent discourse features such as pauses and overlaps, or paralinguistic information such as loudness or speed. The transcription conventions they use can be dictated by the approach (e.g., Jefferson’s conventions which are used in CA) or developed to meet the requirements of the analyst. In either case, transcription remains a representation of the original data and any decisions made in these representations can have an effect on analysis. Elinor Ochs (1992) noted the significance of this in her arguments regarding “transcription as theory”; the way you interpret text is influenced by those features you choose to represent, and different conventions highlight different aspects of conversations and potentially different realities.

As a simple example of the kind of analysis undertaken by those working in CA, consider Example 1 below, which has been transcribed using typical CA notation (Atkinson & Heritage, 1984, following Jefferson). The transcript records information about the relative noise of the setting (line 1), a lengthened consonant *s*: and short pause (.) (line 4), that *what* is spoken very quietly while *then* is emphasized (line 5), for example. These details are all relevant to the analysis offered by the approach, as discussed below.

Example 1

- 1 ((noisy background))
- 2 Richard: or it might be that Dee’s already found them
- 3 but they have to finish
- 4 what Dee’s done and fill in the gaps: (.)
- 5 °what° Dee’s started. .hhh then the
- 6 baseline report itse::lf (.) ((paper
- 7 flipping))which I think is fairly much this
- 8 the s:tuff we’ve go::t (..) with my
- 9 annotations? °heh heh°
- 10 (..)
- 10 Liam: yeah.
- 11 Richard: up to he::re.
- 12 Liam: yeah.

In the case of CA, the participants' reality is at the forefront of any interpretation. Analysts following this school restrict their use of contextual information in their interpretations to that of local context, or the context made relevant by the participants. This follows the reasoning that if the context is significant to the participants, there will be evidence of this within the interaction. Analysis relies on information within the recordings that is verified with internal evidence, evidence which gains significance as the result of repeated research into related phenomena.

Space allows for a mere hint at the issues that would be of interest in this kind of analysis. One issue, for example, could be the long uninterrupted turn that Richard is able to take between lines 2 and 10 (even though there are several opportunities to change speaker, or transition relevance places, which are not taken up by Liam). From this together with other detailed analysis we might draw the conclusion that Richard has more status in this context, based on his ability to retain the floor, and we might use the way in which his turn is produced in constructing this argument, as evidenced by pausing, vowel lengthening, volume, laughter, and so forth.

In other approaches, however, we might use information about the relative hierarchical status of the two speakers as a starting point for analysis, interpreting this kind of language behavior as evidence of that status. The CA approach is bottom-up in contrast to a top-down approach which would use existing and sometimes unchallenged contextual information. The stance on the amount of extra information we bring to our analysis has been a particularly heated debate between CA and a contrasting approach, critical discourse analysis (see van Dijk, 1999, as an example of this debate).

Critical Discourse Analysis

Critical social research has many offshoots including critical applied linguistics (e.g., Pennycook, 2001). Critical discourse analysis (CDA), which is within this critical school, shares a common concern about social inequality, and analysts consider the relationship and interaction of power, discourse, and ideology. Its roots lie in work by Marx, Habermas, and particularly Foucault. In CDA, the analyst is interested in how power is (re)produced in social practice through the discourse structures of unremarkable interactions, and the approach is conceptualized as top-down with a focus on power and how power is used, including both explicit power and naturalized dominance (e.g., Fairclough, 1995; van Dijk, 2008; Wodak & Meyer, 2009).

The approach contrasts markedly with CA in at least two ways: the contextual information which is brought to the interpretation by the analyst, and the methodological approach. In interpreting Example 1, for example, a CDA analyst could take the relative status of the two speakers as a starting point and question Richard's ability to dominate, not only in terms of talk time but also in the ways in which he is summarizing a position on the *baseline report* (lines 6–9) and simultaneously suggesting that this is the position that Liam should take. In addition while the CA approach uses detailed transcription and has a well-established methodology, CDA is much more methodologically eclectic (raising questions of validity and reliability from those in CA) and far less likely to focus on such fine-grained linguistic detail in the interpretations. For CDA the goal is to challenge "taken-for-granted" dominance, and in doing so the analyst makes connections between three different levels: ideology, the context (interpreted widely), and the text itself. In the case of the example, a CDA approach might, for instance, question the nature of the ideological stance that organizations should be divided into hierarchies which assign asymmetrical power.

A middle ground in terms of attention to context can be found in interactional sociolinguistics.

Interactional Sociolinguistics

As the name suggests, interactional sociolinguistics (IS) developed within sociolinguistics, following the traditions of two highly influential scholars, sociologist Erving Goffman (1963, 1974) and linguistic anthropologist John Gumperz (1982a, 1982b). Interactional sociolinguistics aims to analyze discourse in its wider sociocultural context, and draws on the analysts' knowledge of the community and its norms in interpreting what is going on in an interaction, rather than taking the overtly political agenda of CDA or the micro-sequential focus of CA (Schiffrin, 1994, and Swann, 2000, provide useful overviews; see also Tannen, 2005, as an example).

In this framework language is viewed as social interaction and analysts take a speaker-oriented perspective when describing the discourse (following Goffman), identifying "contextualization cues" which allow participants to make situated inferences about likely interpretations of utterances (following Gumperz). The analyst uses information about the sociocultural context with the theoretical reasoning that this context allows the opportunity to more fully identify the contextual presuppositions that figure in hearers' inferences of speaker's meaning (Schiffrin, 1994, p. 105). In practice, this includes such features as turn taking (like CA) and content (like CDA), as well as pronoun use, discourse markers (e.g., *oh, okay, well*), pauses, hesitations, and paralinguistic behavior, among a much wider range of relevant features.

In the case of Example 1, the *or* at the beginning of line 2 could be interpreted as a signal that Richard is providing one of a range of possibilities for Liam. His attitude about the likelihood of the possibility is signaled through the use of hedges: *or it might be that . . .* Further cues are provided in line 5 with the emphasized *then*, which operates as an utterance-initial discourse marker serving to orient the hearer (and speaker) to the fact that Richard is listing the next step for how they should proceed.

This short description of three divergent methods for analyzing a stretch of discourse has suggested the analysis of discourse can provide a range of insights. Each approach offers a different focus, yet all provide useful information about language in use.

Discourse Analysis for the Classroom

The emergence of a communicative approach to language teaching was a catalyst in the rising popularity of the use of DA in applied linguistics (Adger, 2001). The investigation of the discourse of language teaching benefited from early interest in a framework developed by the Birmingham School. This framework was developed to provide a systematic way of investigating classroom talk, particularly the structure of classroom interaction. Sinclair and Coulthard (1975) identified a three-part exchange as a recurrent and significant pattern within classroom practice: the IRF (initiation—response—feedback) exchange. We see these three components in action in Example 2, which was recorded in an advanced English-language classroom.

Example 2

- | | | |
|---|----------|---|
| 1 | Teacher: | [to Fiona] yeah and you look very smart already |
| 2 | | color combination's great |
| 3 | | we call it funky |

- 4 you know what funky is?
 5 Christian: funky [mispronouncing the vowel]
 6 Teacher: funky [looking at student, drilling] looking a little bit unusual
 7 Christian: cool
 8 Teacher: cool yeah like you your hat [laughs]
 9 yeah gotta be cool at the races

In line 4 the teacher asks the class if they understand *what funky is* (I). Christian seeks clarification by echoing the word (line 5), which is interpreted by the teacher as a lack of knowledge. Once the meaning is explained to him the student provides a synonym, *cool*, which is accepted as correct in line 8 (F). The response component of the exchange (R) can thus be seen in both lines 5 and lines 7, indicating the flexibility of the components within the framework, and hinting at the complexity of these exchanges in practice.

The focus on structure is only one of many more areas of interest in more recent approaches to the discourse of the classroom. For example, we might also be interested in the way in which the teacher disseminates cultural knowledge about living in the community (the interaction occurs in response to a newspaper article and photo about upcoming horse races and the associated fashion event, which is an important day in the social calendar for the community), or the way in which the teacher builds rapport with the class through her use of laughter, compliments, and choice of lexical items. There are countless possibilities offered by a discursive approach.

Discourse Analysis and Research Design

DA remains a vast but one of the least defined areas in linguistics (Schiffrin, 1994), and offers many benefits in terms of interpreting the ways in which we discursively construct our social lives. The sketch of a handful of frameworks provided here illustrates that DA means different things to different people. Most significantly, however, it is important to recognize that DA is theoretically grounded. Whatever approach the analyst chooses, DA provides a systematic, rigorous, linguistically informed, theoretically based analysis of data collected following specific (clearly defined) procedures.

One of the perceived weaknesses of a qualitative approach according to those who favor experimental designs is the validity and reliability of the research; the analyst has the potential to bring a biased lens to the interpretation. Silverman (2010) notes that this kind of qualitative research must be able to withstand scrutiny, be replicated, and avoid "anecdotalism." Increasingly researchers are being challenged to provide a warrant for their interpretations (Cameron, 2009, and Swann, 2009, provide recent discussions of warranting). One way in which analysts justify their approach is triangulation. To enhance the credibility of the analysis researchers compare their findings with other sources, including other data sets, existing research, and attention to evidence provided by participants, whether elicited through deliberate attempts, or as found in local context.

The issue of the credibility of a qualitative approach recognizes that there are multiple readings of any text. This is one of the strengths of a discourse analytic approach since good practice allows access to the complexity of social interaction. In terms of application, recognizing the assumptions, weaknesses, and strengths of a certain approach is an important consideration. This is summed up in a quotation from Stubbe et al. (2003, p. 380) on the range of discourse analytic approaches currently in use in the field and the responsibility of the analyst for the choices they make:

Each approach therefore provides a slightly different lens with which to examine the same interaction, highlighting different kinds of context and respective features. These are not necessarily in conflict with one another (though in some cases the analyses and/or the theoretical assumptions underlying them are difficult to reconcile); rather, they are complementary in many ways, with each approach capable of generating its own useful insights into what is going on in the interaction, with the proviso that the framework adopted needs to be a good match for the research questions being asked.

Making an appropriate selection from the range of DA approaches and carrying out systematic analysis within a theoretical frame allows for productive understandings of the social interactions in which we engage and offers significant application within linguistics.

Discourse Analysis in Language Assessment

ANNE LAZARATON

When second language (L2) learners take a language test, they are really only interested in one outcome: their scores. Likewise, language testers have been preoccupied with ensuring that these scores, which are the product of the assessment, are reliable and valid. In L2 performance assessment (where L2 learners produce speech or writing for assessment), the primary challenge is to ensure consistent ratings of language. Much work in oral language assessment (the focus of this entry) has been (and continues to be) devoted to ensuring both *inter-rater reliability* (the degree to which two or more raters agree on scores) and *intra-rater reliability* (or the degree to which one rater's scores are consistent across language samples and over time). In more recent years, issues of test *validity* (i.e., the process of making inferences from test results; see Messick, 1989; Moss, 1994) have emerged as a central concern for the language assessment community. This is particularly true for L2 speaking tests, where the interests of some scholars have shifted from a focus on rating consistency to the process of speaking assessment itself. That is, what typifies the language that interlocutors produce in speaking tests? And how can descriptions of that language feed into reliable and valid rating of test talk? *Discourse analysis* has proven to be a very promising method for discovering answers to these questions.

Discourse analysis (or DA) traces its roots to various disciplines—anthropology, linguistics, philosophy, psychology, and sociology, to name a few. Generally speaking, discourse analysis as it is practiced in applied linguistics has several defining features:

- An emphasis on *authentic* language data—authentic in the sense that it is produced spontaneously rather than elicited experimentally.
- Attention to the importance of *context*—the setting in which the discourse occurs, the participants who produce the discourse, and the roles, identities, and relationships that are involved in these settings and with these participants.
- Exploration of the interaction between and among speakers rather than of monologic talk. An important concept in this regard is *co-construction*, in which constructs such as actions, activities, and identities are seen as a product of interaction, rather than static entities that characterize an individual and his or her behavior. The significance of this idea for understanding talk-in-interaction is not news today, but for many years linguists, second language acquisition researchers, and language testers analyzed and assessed spoken language as if it were solely the cognitive product of a single speaker, with no important influence of those with whom the speaker is interacting (see McNamara, 1997). This fact accounts for the language tester-as-discourse analyst's interest in *face-to-face* speaking tests, where test takers speak with an interviewer or other test takers, or both, rather than in *computer-mediated* assessments, where test takers produce recorded, monologic talk in response to test prompts delivered via a computer (as in, most notably, the speaking section of the new Internet-based TOEFL test; www.toefl.org). Although some research has been undertaken to understand the test talk of the latter type (e.g., Lazaraton & Wagner, 1996), the most productive work has zeroed in on test discourse when interlocutors are co-present.

2 DISCOURSE ANALYSIS IN LANGUAGE ASSESSMENT

- A careful transcription of discourse data, using any of a number of conventional transcription systems (see Swann, 2010).
- A rich, deep analysis is the usual goal of this approach, so concerns about obtaining the “proper” sample size and producing generalizable findings are not of primary importance. Related to this is the fact that quantification of discourse data is not a hallmark of the approach.

With this background in mind, we can consider why discourse analysis has been adopted as a viable means of understanding L2 test talk. A foundational article by van Lier (1989) questioned the assumption that speaking tests mirror natural conversation and called for a close analysis of the oral language produced in these assessments to determine what sort of “interactional event” it constitutes. That is, claims about the conversational nature of face-to-face oral proficiency tests and, thus, their validity as measures of L2 language ability, had not at that point been empirically verified; his paper marked a turning point for many scholars in the field.

Around the same time, Shohamy (1991), in a review of extant literature on DA in language assessment, further advanced van Lier’s call for empirical research on the process of speaking test assessment. Specifically, she noted that speaking tests had been doing an adequate job of representing different discourse *types* (e.g., interviews, discussions, reports), but inadequate attention had been paid to test talk discourse *features* and how they are operationalized in rating scales. Her point was that the construction, implementation, and validation of rating scales for speaking test talk (i.e., marking schemes for features like pronunciation, interactive communication, language use, lexical resource, etc.) should be based on the *actual* linguistic features present in *actual* speaking tests rather than what experts hypothesize the features should be. This challenge has been taken up in studies that have looked at the relationship between both features of test discourse and the operationalization of rating scales, and their ultimate impact on speaking test scores. And discourse analysis, with its emphasis on process, context, co-construction, and careful analysis of transcribed language data, has been adopted as a primary analytic approach for investigating test talk.

Although space limitations preclude a comprehensive survey of this literature (but see the suggested readings list), we now turn to a summary of several foundational studies that have attempted to answer two questions: “What type of interactional event is a speaking test?” and “What is the relationship between the discourse produced in speaking tests and the rating scales used to evaluate the language produced?” More often than not, scholars who are interested in L2 test discourse attempt to answer both questions to some degree—which makes perfect sense because the two are intrinsically related. We take up the former question first.

Perhaps the most salient findings about the discourse produced in face-to-face oral language assessment relate to the structure of speaking tests as a form of “institutional talk” (see Drew & Heritage, 1992) that is demonstratively distinct from conversation. *Conversation analysis*, a discourse analytic approach that comes primarily out of sociology, has been fruitfully employed in these studies by directing research focus to the actions undertaken in the turn-by-turn construction of test talk. For example, research has confirmed that the discourse produced in speaking tests has an identifiable structure, one which has much more in common with the traditional interview than with spontaneous conversation. One rather obvious aspect of face-to-face speaking tests is that their structure is almost always dictated by an interviewer protocol or agenda (also known as an interlocutor frame). What is intriguing is the way that these agendas are more than physical documents; they are co-constructed in, by, and through the talk that takes place. Lazaraton, in her conversation-analytic research on ESL course placement interviews (1991), concluded

that “the encounters share features with conversation, but they are still characteristically instances of interviews, and interviews of a distinctive kind, for the participants” (p. 226; see also Johnson & Tyler, 1998 on this point).

Rather than analyzing the speaking test macrostructure as outlined above, a micro-interactive focus on interviewer behavior has also been revealing. So, when interviewers conduct and take part in a speaking test, a number of studies have found that interviewers routinely “accommodate” to the test taker(s) involved in predictable and definable ways. For example, Lazaraton’s (1996) conversation-analytic study of 60 interviews from the Cambridge Assessment of Spoken English (CASE) pointed to CASE interviewers who routinely rephrased questions that test takers found difficult, supplied vocabulary, and completed, repeated, corrected, or repeated and corrected test-taker responses. There are two ways to view these results. On the one hand, this interviewer behavior seems to share some of the documented features of L1 (first language) speaker talk when conversing with L2 speakers in some L1–L2 conversation. As such, these findings imply that test talk mirrors more natural interaction, bolstering claims about test validity. On the other, the results were seen as problematic by the CASE test developers, who had empirical evidence that their interviewers modified their test talk in ways that potentially threaten the reliability of the test and scores derived from them, if the interviewers do not exhibit the same behaviors with different test takers. As a result, Cambridge ESOL, the producer of the CASE examination, undertook the development of more detailed interlocutor frames, implemented oral examiner checklists, and tightened up training and monitoring procedures for all Cambridge ESOL speaking test examiners and raters.

A more recent inquiry on this topic is Brown’s (2003) case study of interviewer variation and its impact on test-taker performance and ultimately, raters’ perceptions of candidate ability. Her discourse analysis of test talk in the speaking module of IELTS (the International English Language Testing System; www.ielts.org) by two interviewers who interacted with the same test taker at different times indicated how interviewer behavior may be a source of variability in the test. Retrospective verbal reports by the raters illuminated their perspectives on the test interactions; using discourse analysis and these reports, Brown was able to link interviewer behavior with different impressions (and ratings) of test-taker proficiency. As alluded to earlier, Brown also notes that

Whilst claims to validity for conversational oral interviews as measures of nontest conversational skills are based largely on the unpredictable or impromptu nature of the test interaction, ironically this very feature is also likely to lead to a lack of standardization across interviews, and hence potential unfairness. (p. 1)

She calls for more work on defining the construct being measured in speaking tests, as well as a greater emphasis on careful training of interviewers, in addition to the ongoing efforts to train raters.

A similar study conducted by Ross (2007) investigated inter-interviewer variation, in this case, in the oral proficiency interview (OPI). Here, the same test taker took part in two OPIs, three months apart, with two different interlocutors. Ross’s microanalysis of the talk produced by the interlocutors and the candidate suggests that, although the test taker appeared to “backslide” in the second interview, different interviewer styles do not necessarily lead to different ratings of oral proficiency.

Lest one be left with the impression that it is only speaking test *interviewers* whose behavior may be implicated in test scores, the behavior of a peer or partner in speaking tests that employ a *paired format* may also impact test ratings. Just as second language classrooms now rely on pair and group work in implementing class activities, language testers have also explored the utility of moving away from interactions directed by the

interviewer to ones in which the test takers talk to each other. As a result, our conceptualizations of “the interlocutor effect” in L2 test talk have necessarily expanded. Much more is now known about the paired format in speaking tests (as summarized by Taylor & Wigglesworth, 2009); this topic represents an additional strand of current research in speaking test assessment. That is, although characteristics such as the gender, cultural/L1 background, and language proficiency of one’s interlocutor likely affects the *discourse* produced with a partner, the question remains whether this interlocutor effect influences *scores* on the test (see Lazaraton & Davis, 2008).

A recent endeavor to explore issues surrounding paired speaking tests is reported by Galaczi (2008), whose conversation-analytic study of 30 dyads audiotaped during a collaborative task in the FCE speaking test (First Certificate in English; www.cambridgeesol.org) focused on “fundamental conversation management concepts” as well as “global patterns of interaction” (p. 89) as a means to empirically construct speaking test rating scales. Her analysis of the discourse produced in peer–peer test talk pointed to three general forms of interaction between participants: (a) “collaborative interaction,” marked by topic expansions, a balanced amount of talk, and listener support and attention; (b) “parallel,” in which participants engaged in “‘solo’ vs. ‘solo’ interaction” (p. 102), producing equal amounts of talk, but advancing their own separate ideas, with only minimal acknowledgment of their partner’s contribution; and (c) “asymmetric” where one participant was dominant and the other passive and the amount of talk produced was unequal. Her discourse evidence of these three interactional patterns was used to understand the relationship between these interactional styles and actual scores on the “Interactive Communication” subscale for rating FCE speaking tests. She ascertained that the descriptors at the higher end of the five-point scale (e.g., mentions of topic extension, follow-up questions), characterized the collaborative style of interaction, whereas lower-end descriptors were consistent with the parallel style. This aspect of her analysis suggests one avenue for applying discourse analytic research findings to speaking test rating scale construction and validation, and various rating scale revision projects have been based, in part, on the sorts of discourse analyses as described in this entry (see, for example, Galaczi & French, 2007).

Through these and other studies regarding speaking assessment, discourse analysis has gained prominence as an approach to investigate issues such as performance, task type, rating, and validity. As a highly intensive process, discourse analysis provides a systematic method to gain detailed understanding of language use and context as well as considering their connection to the language involved in assessment.

Discourse Analysis in Literacy Research

REBECCA ROGERS AND MÓNICA PINI

Discourse Analysis in Literacy Research

Discourse analysis is a transdisciplinary set of theories and methods that have been widely used in literacy research. Over the past decade, there have been many empirical studies, edited books, essays, and reviews devoted to the areas of discourse studies generally and in literacy research in particular (e.g., Gee, 2002a; Collins & Blot, 2003; Burns & Morrell, 2005; Rex, et al., 2010). This is so because of the commensurability that exists between literacy research and discourse studies. Both are traditions that address language as a social semiotic practice that both constructs and represents the social world. Further, both address problems through a range of theoretical perspectives. Many of the problems that are addressed, particularly in a globalized world system, have to do with power and inequality. Discourse studies provide the tools for addressing the complexity of movement across literacy sites and practices in an increasingly global and digital world.

The study of discourse has a very long history and can be traced to language philosophers and social theorists such as Bakhtin (1981), DuBois (1903/1990), Pecheux (1975), and Wittgenstein (1953). Linguistic analysis in literacy research grew out of the work of socio-linguistics, linguistic anthropology, and cultural and media studies. Schools, classrooms, and literacy practices were looked to as sites for studying not only the microdimensions of classroom talk but also the ways in which social structures are reproduced at macro-levels. Discourse analysis in literacy research has been conducted on many different fronts and across the age span with a full range of research questions and approaches. Rex, et al.'s (2010) literature review, in particular, is a very good, comprehensive paper that includes over 300 studies in the field of literacy research that use discourse analysis.

Discourse analysis has been used within many areas in literacy studies—from the preparation of literacy teachers and professional development, to literacy policies and politics, to early literacy and academic literacies. It is important to note that we include some Latin American and Spanish authors who are developing work around these topics. In Latin America, discourse studies in relation to literacy are mostly framed in the field of communication or popular education (particularly influenced by the work of Paulo Freire), areas that are rich in practice but not very well developed in scholarship. Well known in Latin America is the work by Francisco Gutiérrez and Daniel Prieto Castillo, and more recently that by Jorge Huergo and Maria Belén Fernández (Gutiérrez & Prieto Castillo, 1991; Prieto Castillo & Van de Pol, 2006).

As one might expect, there is a diversity of theoretical and methodological perspectives across the studies. Indeed, we find a full range of analytic approaches including: systemic functional linguistics, conversation analysis, cognitive-linguistic approaches to metaphor, text linguistics, social semiotics, among others. Common across these studies is that discourse analysis is used to describe, interpret, and explain the relationships between texts, social practices, and society-wide processes. In general, these traditions share the assumption that because language is a social practice and because not all social practices are created and treated equally, all analyses of language are inherently critical (Gee, 2002b; Blommaert, 2005). In this entry, rather than recount the substantial amount of work that

has been done in this area, we address three issues germane to approaches to discourse analysis in literacy studies and provide an example of a literacy study that has advanced our understanding of each concept.

Moving Beyond Printed and Spoken Texts

Discourse analysis has been critiqued for its emphasis on written and spoken texts as the source of meaning, often at the neglect of meanings made in other modalities (Street, 1984; Linell, 2007). In the field of literacy research, despite significant advances in social semiotic theory (Hodge & Kress, 1988), discourse analysis remained—until the end of the 20th century—primarily focused on written and spoken texts. However, the advance in multimodal pedagogies sparked the development of multimodal discourse theories and methods that could be used to examine multimodal designs. Important here is the development of a tradition called New Literacy Studies (New London Group, 1996) which recognized the many ways in which people use literacies in their daily lives from grassroots literacies, technoliteracies and racial literacies to media literacies, scientific literacies and transglobal literacies. From an ethnographic standpoint, this work raised questions about what literacy uses meant to its users, in context. Thus, claims were made that differences in literacy practices were not deficiencies but rather, differences in standpoints and culture. Multimodal pedagogies—such as those proposed by the New London Group—work consciously across semiotic modes to unleash creativity and reshape knowledge and learning. Of critical importance is that people act as designers of meaning and the recognition that literacy is not solely a linguistic accomplishment.

Related to this, and an area that continues to expand and deepen, is literacy research in global times. In part, the multimodal turn in practice and research has been a result of the increasing amount of digital, electronic, and globalized texts that structure lives. Indeed, the Internet, World Wide Web, and immigration/migration have accelerated the rate to which theories of multimodality are salient in today's educational climate (Blommaert, 2008). Taking an expansive view of digital literacies—one that includes popular cultural practices, everyday practices like workplace blogging, online shopping, and participation in online network sites—leads to the need for new and creative ways of examining such practices. As a result, a growing number of researchers are using discourse analysis to inquire into how meanings are made across literacy events and practices in a contemporary, globalized, and increasingly digital world and to study the quickly growing field of digital literacies. As a result of this semiotic turn in literacy studies, discourse analysis has been central in the development of New Literacy Studies and, in turn, the development of new multimodal pedagogies has sparked the development of new theories and methods of discourse analysis to examine such practices.

Multimodal Social Semiotics: An Example

Karen Wohlwend's research (2011) uses Kressian multimodal analysis and theories of social semiosis to understand how actions are made meaningful and social *in practice* rather than in representation. Taking up the sounds, words, images, and actions of children during a reading lesson in a kindergarten classroom, she examines instances of classroom activity to see how modes shape children's literacy learning and participation (Wohlwend, 2011). Wohlwend especially relies upon the mode of gaze as a way of revealing which modes were most apparent in a classroom literacy event and how the foregrounding of particular modes enforced a set of power relations (teacher/student; reader/nonreader) legitimated by prevailing educational discourses. Mapping the interplay of modes uncovers power

relations and social effects visible at the level of modes. Wohllwend argues that a clear understanding of tensions across multiple perspectives could help teachers to see discourses as resources and to act strategically with greater awareness. Multimodal analysis provides a way for early childhood teachers to see how the tangible everyday aspects of familiar classroom activity matter.

Considering the Multiethnic Roots of Discourse Theories

Discourse analysis in literacy research has been conducted across the globe, drawing on many different theories and models of discourse and communication. Despite this diversity, discourse analysis, as a field, has historically been influenced and developed by theories and methods of the North-Atlantic (Blommaert, 2005). This has been exacerbated by the predominance of English-based journals, research universities, and conferences that has shaped and continues to shape the field. Because of the influence of North-Atlantic epicenter of scholarship in discourse studies, theories of discourse tend to reflect monocultural values and perspectives. There is growing discontent with epistemological commitments of critically oriented approaches to discourse analysis, a set of theories and methods rooted in Western epistemologies, and its commensurability with understanding multicultural discourses (Dissanayake, 2003; Shi-xu, 2006, 2009; Ladson-Billings, 2003). This should be taken as a particular concern for field of literacy research given—as Rex et al. (2010) point out—so much of the scholarship in this area is concerned with issues of access, equity, and diversity.

There are two areas in which theories of discourse in literacy research might be rethought to be inclusive of multiethnic perspectives. The first is in the area of binarism and the dualism of thought which assumes an “either-or” nature of things (Shi-xu, 2009). The consequence of seeing the world in terms of binaries is the tendency to value causal relations and coherence instead of complexity and diversity. The binaries which structure Western thought (i.e. racist/antiracist; privileged/oppressed; literate/illiterate; able/disabled) neglect the dialectical spaces of social problems and solutions (Ladson-Billings, 2003; Shi-xu, 2009). In the literacy field, discourse analysis has proven very useful for problematizing the cultural models associated with binary modes of thought. However, this problematizing has been conducted within a Western epistemological frame. Further, less attention has been given to the ways in which dialectics of thought are discursively managed and mediated across people and practices (Lee, 2006).

Second, the well-known Western logic of thought “I think therefore I am” stands in opposition to the African-centered concept of “I am because we are” (Ladson-Billings, 2003). It has been well documented that Western communication, rooted in Cartesian structures, is constructed around the notion of the individual as the final arbiter of meaning. That is, Western epistemologies are focused on individualism, the primacy of the speaker’s goals and a separation of mind and body. Shi-xu (2009) argues that theoretically, critically oriented forms of discourse analysis proceed from a view of language that views the individual speaker’s goals and intentions as paramount. This view of communication stands in opposition to Eastern theories of communication (Shunqing, 2008; Shi-xu, 2009; Feng, 2009) where the intention is to be oriented toward the listener, the inter-subjective nature of the exchange and the focus on the collective, with the individual as part of the group. Examples of cultural, gender, and class specific discursive strategies and patterns are abundant in literacy studies. However, less work has explored the cultural logic of the epistemological and ontological structures underlying theories of discourse and associated forms of discourse analysis.

One response in the literacy field has been an increasing diversity of theoretical perspectives and methodological approaches that acknowledge—if not respond to—the need for

multiethnic models of discourse. For instance, discourse analysis in literacy research is being combined with perspectives such as: postcolonial, critical race, whiteness studies, feminist, sociocultural, or cultural studies. Such theories help researchers to rethink monocultural theories of discourse and show how the analytic procedures might be tailored to specific research questions and populations. What is needed, however, is what Dissanayake (2003) refers to as “creative and critical engagements with Western theories” (p. 25) that includes close scrutiny of Western theories of discourse—choice and intention or identity, for instance, in terms of multiethnic theories of communication.

Multiethnic Theories of Discourse: An Example

Medina’s (2010) study of immigrant children’s bilingual discussion of literature in an elementary school classroom in the United States provides a very good example of attending to multiethnic theories of discourse. Medina uses three of Gee’s (2002b) seven building tasks (identity, world building, and connections) and ties them theoretically to theories of translocal cultural movement from cultural studies and postcolonial studies. She demonstrates how the students’ interpretive processes in two literacy events—a discussion of a book and a storytelling event—transcended nation, history, and culture and yet, were also deeply rooted in place, time and culture. For instance, the narratives of “El coyote” and the legend of “La llorona” are tales that are widely told in Latin America and have multiple versions and meanings. The children in the group—from El Salvador and Mexico—drew on their cultural resources, personal experiences, transmedia connections, and imaginations to make meaning individually and collectively. Medina attends to how space and time are evoked in the discussion through content and function words.

She shows how the students drew on the discourses of time, place, and action and how meanings are expressed through certain discursive practices. For instance, Medina shows how Francisco shifted in his use of the local “I” to a global “we” in the discussion to open up the experience of border crossing to a collective experience (p. 51). Or, another example of discursive practices was how Juan explained “el coyote dicen que tiene tres pelos del Diablo” (The coyote it is said has three hairs of the devil). Medina writes,

He constructed his comments using common linguistic devices of how oral traditions and popular stories are passed along and transformed. Juan’s use of an implicit pronoun in Spanish in relation to the verb “dicen” (it is said that) suggests that some people somewhere say that the coyote has three hairs of the devil, but at this point the “they” is impersonal . . . this use of linguistic features shows the creation of a space for response that incorporates oral traditions. (p. 52)

Particularly useful about her scholarship is her careful description of her discourse analysis procedures and the way her theories of discourse, informed by translocality, provide insight into its shaping effects on identity and community.

Reconstructive Forms of Discourse Analysis

Most scholars of critically oriented discourse analysis have concerned themselves with a critique of power, domination, and oppression. By way of contrast, a number of scholars are calling for a focus on the relationship between literacy and productive uses of power (Luke, 2004; Martin, 2004; Scollon & Scollon, 2004; Janks, 2005). Luke (2004) points out the potential for what he calls “reconstructive” versions of discourse analysis that focus on how liberation, solidarity, and community are constructed. Martin (2004) refers to this

approach as “positive discourse analysis” which can provide a complementary focus on “how people get together and make room for themselves in the world—in ways that redistribute power without necessarily struggling against it” (p. 183).

In literacy research, much scholarship has examined the ways that literacy practices reproduce racist, sexist, classist social relations. Race in literacy research, for example, has most often been discussed in terms of discriminatory practices and policies. However, a positive discourse analysis would examine the discursive composition of antiracist practices and policies, those that create an alternative to dominant discourses in society. Further, there exists scholarship that has illustrated how schools might open up opportunities to non-mainstream students through documenting multiple literacies, ways of knowing, outside of school learning competence (e.g., Richardson, 2003). This has provided evidence for viewing these literacies as powerful practices. Yet we know less about the discursive contours of multimodal, multicultural, antiracist, socially just classrooms, curricula, and literacy policies. There is quite a bit of room in the area of positive discourse analysis in literacy research.

Positive Discourse Analysis: An Example

Margaret Price (2007) examined the academic literacies surrounding conferences and how they represent people with disabilities. She argues that conferences are often among the least accessible spaces that people with disabilities encounter since they combine routine inaccessibility of public spaces with conference participants’ lack of familiarity with the space. She asks: How does each document imagine the disabled conference participant? She analyzed the verbal and visual choices made in the documents produced by eight professional organizations that explain its policy on accessibility surrounding the academic conference. Price explains her orientation toward positive discourse analysis in this way:

In selecting the corpus, I deliberately attempted to identify leaders in the area of academic statements on disability policy. My aim is to ask what these statements are doing well, and how they might do it better, rather than to pooh-poo work that, as I know from experience, involves a great deal of time and effort. This study attempts a “reconstructive” form of CDA through which I make three critical moves: identify the statements’ actions to improve accessibility; provide suggestions for their potential revision, as well as for the writing of the new statements; and finally, ask what problems might inhere in kairotic professional spaces that these statements cannot address. (p. 6)

Important to note is Price’s attention to organizations that have a record of sensitivity toward issues of disability, particularly in their “academic statements on disability policy” versus attending to those who do not show leadership in this area. Her findings draw attention to the justification of the documents, the relationships between authorship and audience, and how the documents enact accessibility through their design (e.g., layout, format, modality) and how they imagine their policies in practice at the conference. A few examples will provide insight into Price’s use of reconstructive analysis.

About the authorship and audience of the document, Price analyzes an example from an APA document that requests readers to make contact with conference officials regarding disabilities, regardless of whether they themselves have a disability. This implies that everyone should be concerned with issues of access for people with disabilities. She also points out that the reader is offered a multimodal invitation to contact the office of disability issues, important to consider in light of accessibility.

In another example, Price analyzes each policy’s web accessibility through the “links” between documents. Such linking, Price argues, provides insight into the kinds of beliefs,

relationships, and priorities that are established in the documents. She demonstrates how on the “General Information” page of the Pediatric Academic Societies’ Annual Meeting, the links titled “Attendees with Disabilities” are equal in size to the links called “Abstracts.” Price concludes, “policy regarding disability access takes on a value at least approaching, if not equal to, the value awarded to abstracts” (p. 17).

The results of the discourse analysis led to Price posing eight generative questions that she intends for professional organizations to consider in light of their policies on accessibility. A few examples are: “What audiences are imagined, addressed, and invoked?” and “What impairments or specific accommodations are mentioned, what kinds of disabilities do these account for, and which are left out?”

Closing Thoughts

The field of literacy research offers unique opportunities for developing discourse studies. As we have addressed the issues of multimodality, multiethnic theories of discourse, and positive discourse analysis, we pointed to examples of research that we think are particularly clear and transparent in their methodological approaches and procedures. The areas that we have reviewed above also pose continuing challenges for literacy researchers. First, it is often difficult for literacy researchers to step outside of discourses of education and schooling that they know well. This points to the need for increased reflexivity and interdisciplinarity which may shed contrast on otherwise taken-for-granted concepts. Second, as a field, we need to keep developing frameworks for global networks of knowledge, power, and discourses. Further, perhaps an obvious point is that literacy researchers may very well find kindred spirits in their study of discourse practices with folks outside of literacy studies and even outside of the academy. Novelists, journalists, activists, and therapists all work with discourse as part of their daily work and are interested in the effects language and literacy practices have on individuals and the social world. We are very interested in the ways in which people engage with discourse analysis in “literacy work” outside of the academy. Another productive direction might be a meta-analysis of the findings of discourse analysis within the field of literacy studies. The past ten years has resulted in many studies but we do not know the significance of these studies taken together. Also related is a need to examine the findings across fields such as political science, media, and law. This could lead to identifying common trends that might signal future directions for theory, practice, and social action.

Discourse and Cognition

LAURA JENKINS AND JONATHAN POTTER

Cognition has been dealt with in discourse research in two distinct ways. First, building on cognitive psychology, but typically oriented to a critical agenda, cognition is seen as an underlying substrate of entities, processes, and mechanisms all of which have consequences for a person's conduct. In this view discourse and cognition are treated as distinct but related realms. Second, the tradition of ethnomethodology, conversation analysis (CA), and discursive psychology (DP) focuses on psychological matters as publicly available, demonstrable, and fitted to ongoing practices. In this view cognition is a practical participants' concern. Instead of a separate domain of discourse and cognition, psychological, cognitive, and emotional matters are built in interaction.

Discourse and Cognition as Separate but Interrelated Realms

Discourse and cognition are treated as distinct but linked entities within critical discourse analysis (CDA). The different theoretical and methodological approaches under the umbrella of CDA focus their analysis on the role of discourse in reproducing and challenging the social power (access to resources) of institutions and groups (Wodak, 1999). Analysis has typically focused on political speeches, policy documents, textbooks, radio shows, and newspaper articles. CDA attempts to identify the discursive structures, strategic properties and persuasive rhetoric that contribute to maintaining social inequality by exerting control over other groups, limiting their freedom or influencing their minds (Van Dijk, 1993). This latter form of "cognitive" power is enacted by strategies of persuasion and manipulation through text and talk.

The work of CDA seeks to explain how broader notions of power, dominance, and social inequality link with communicative interaction, text, and talk. It is the role of cognition that some CDA researchers argue is the necessary connector explaining the relationship between society and language (Van Dijk, 1993; Wodak, 2006). Mental models which access information already stored in the memory also get updated according to feedback in a recursive process. This view of the cognitive dimension is used to explain both text production and text comprehension (Wodak, 2006). Cognitive objects such as knowledge, beliefs, and attitudes are taken to drive the person's subjective interpretation of the social environment. Some of these objects may be socially shared but nevertheless individually and cognitively represented. This allows meanings to be widely accessible to groups of people and provides an account for the coordination of social action.

Wodak (2006) has developed an analysis of the rise of anti-Semitic discourse in the public and private sphere in Austria. Her approach is grounded in the notion that people hold cognitive attributes such as attitudes, stereotypes, and prejudices about specific social groups. She highlights the historical roots of prejudiced beliefs and the development of anti-Semitic stereotypes in political discourses, debates, and commonsense knowledge. Terms with explicit racial meanings have been recontextualized and turned into easily understandable insinuations with explicit prejudiced meanings based on the collective knowledge of the audience. So for example "East coast," which once referred to powerful Jewish lobbies in New York, was connected in Austrian discourses without this frame of

reference, developing its own metaphorical structure. Perceptions, beliefs, and opinions about real or imagined communities are treated in CDA as shaped by such metaphors and narratives, which in turn guide a person's commonsense knowledge and decision making. Within this framework of understanding cognition, meanings produced in public and political discourses are tied to specific (in this case anti-Semitic) ideologies, and can become widely accessible and integrated into the cognitive models held by individuals. In this way metaphors, stories, and fantasies are stored cognitively and inform discourse practices, and thus can be passed down from generation to generation.

In seeking to examine how discourses express and legitimize inequality and dominance, and how the discourse is received in a persuasive manner, CDA casts the individual as possessing an internal mental organization that both produces and is informed by discourse. Cognition is described as an empirical bridge between social reality and discourse.

Puzzles and Possibilities: What Is the Status of the Cognitive?

CDA casts cognitive objects such as knowledge, beliefs, and attitudes as both shaped by and generators of discourse. The approach treats mind as a live, structured, causal entity. Unobservable mental representations of reality are taken to become visible by their consequences in discourse (Van Dijk, 2006). Cognitive states are used by people to explain others' behavior, and CDA endorses this presupposed existence of cognitive objects and theorizes how they inform discourse.

Cognition is treated as evidenced by patterns of discourse. There are at least two key problems with inferences of this kind. First, if the existence of cognitive objects is based on their presence in discourse, discourses that generate notions of cognitive states need to stand up to grammatical scrutiny. However, such discourses do not always accord with a cognitive theory. Through a grammatical analysis of discourse, concepts of mind and cognition can be dismantled in a way that demonstrates that the mental state ideas in discourse are mistaken. If someone says "I think in my head" this may be taken to show that the speaker possesses a "mind" in which ongoing cognitive processes generate thoughts that are not disclosed. However, critics such as Coulter (1999) note that "I" refers to the speaker as a person, the speaker is not located in his or her own head, and thus his or her thinking is not done there but rather in other locations, such as an office, apartment, or on the street. In this way the strong argument here is that the nonexistence of the mind can be proven conceptually.

In addition, discourse about the mind has so far been referred to as disembodied assertions that theorize cognition. Wittgenstein (2001) held that the meaning of an expression (for example about the mind) is not the object it represents; rather, meaning is determined according to its use in the practice of speaking a language. Confusions can arise when discourse analysis constructs speakers as in possession of a mind while ignoring the practices they are performing through their talk (Potter & Edwards, 2003).

Discourse Research as an Alternative Way to Analyze Cognition

CDA considers discourse and cognition as separate entities that are related or entwined in a way that would mean a person's cognitive processes could be accessed through language. This is one way in which cognitive assessment takes place in patients in cases of suspected neurological damage. In order to introduce an alternative route to cognitive analysis based on empirically grounded observations about interaction, we will look at a contrast between a classical inquiry into cognitive processing and a CA approach which involves accounting for how humans grasp the world and interact with one another

(Schegloff, 1999, 2006). This approach to analyzing cognition examines the resources people use in talk-in-interaction, the observable, ordinary human sociality in the details of actual instances of talk.

Schegloff (1999) studied the testing of a man whose brain hemispheres were severed to deal with neurological problems and subsequently had challenged linguistic abilities. Schegloff considers in great detail a sequence in which the patient demonstrates compliance to an indirect request to come closer to the table before the testing begins. The patient displayed an orientation to turn taking and sequence organization including the timing of his gaze and embodied responses to actions. Schegloff painted a sharp contrast between this analysis and the conclusions that the patient did not do well on cognitive tests related to commands and indirect requests. In this way, Schegloff demonstrated that rather than examining commands and indirect requests, the tests themselves focus on decontextualized actions that are not part of courses of actions that have naturally come about.

This approach offers an alternative form of cognitive analysis, which rejects the model that the prototype for human life is individuals planning and performing in isolation. Instead, discourse research examines the resources people bring to bear on what is relevant to them, requesting, inviting, offering, evaluating, making plans, understanding, and doing what humans do. This provides for a cognitive analysis that examines the production of cognitive objects in talk-in-interaction. One mental state that Drew (2005) describes as produced in talk is "confusion." Drew demonstrates the way in which confusion is generated through talk with resources such as initiating a repair on what has been said or through the characteristics of intonation. It is produced in ways that confound expectations based on conversational norms. In this way confusion is displayed or generated by interaction; it is produced in talk.

In a similar way, Heritage (2005) describes how a cognitive theme such as "recollecting" is embodied in interaction. Rather than considering change in cognitive processes as the subject of investigation, this sort of analysis can show how displaying a "change of state" in talk is relevant as part of interaction. Heritage demonstrates the way *oh* is a resource in interaction which displays receiving good or bad news, or can show that something relevant has been remembered. In the context of questions, responding with an *oh* can show that the questioner has not expected the answer, or simply confirm that the questioner has by receiving the answer changed in state from "uninformed" to "informed." In this way "*oh*-receipts" have been linked to displaying epistemic issues of who knows things and who has authority over knowledge. Again, these mental objects such as knowledge, and cognitive processes such as changes in knowledge or recalling information from memory, are analyzed as things generated in and for interaction.

In contrast to viewing discourse and cognition as separate entities that are in some way linked, cognitive objects have been shown to be produced in talk as useful deployable resources for the purpose of ongoing interaction.

Puzzles and Possibilities: What Is the Relationship Between Displays of Cognition in Talk and Underlying Cognitive States?

The analytic approach we have described above takes a different view of cognition from that of classical cognitive theorists, and grounds the analysis in the examination of everyday or institutional talk-in-interaction rather than analysis of tests or experimental methods. It seeks to demonstrate how what could traditionally be thought of as cognitive states and processes are relevant objects, produced to manage the everyday tasks in interaction. The relationship between discourse and cognition still remains complex. It leaves questions in relation to whether cognition exists as an underlying realm that is "represented" or "produced" in talk, and what the relationship is between this realm and the displays of cognition in talk.

In order to describe a connection between the two realms, Drew and Heritage draw a distinction between verbal conduct and cognitive states (Potter, 2006). However, the challenge is to show that it is a distinction that is discovered in their data, rather than something that is assumed. We can start to ask questions such as: How does the confusion that Drew describes as generated in interaction relate to a putative cognitive state of confusion? Does what is displayed in talk have related underlying states? In a similar way, the *oh* particles in Heritage's work are able to display a change of state, but are they necessarily accompanied by an actual cognitive or neurological change, and if so, how could these changes also be studied in their own right? At the least, these studies highlight interactional phenomena that are relevant to, and should be accounted for, in cognitive theories.

Discursive Psychology as a Way of Studying Cognition as a Practical Participants' Concern

In this final section we consider a field of study that focuses on the types of phenomena under the umbrella of "cognition" from a practical and interactional perspective. DP was developed as an approach to psychological issues as they appear in talk. Reference to mental states in everyday explanations and descriptions provides opportunities for the analyst to investigate the way mental states or psychological phenomena are used as a practice within interaction (Edwards & Potter, 1992). By examining psychological phenomena (such as cognitive states) as things that are constructed, attended to, and understood in interaction and psychological language, and broader "mental practices" as organized for action and interaction in talk and texts, DP reworks a range of concepts such as event memory, knowledge, attitudes, and script knowledge as discourse practices.

DP focuses on discourse as the primary means through which actions (everyday actions central to people's lives) are done and interaction is coordinated. The analytic focus is not on the cognitive processes themselves; rather it seeks to examine how people report on events, perform evaluative practices, and speak as if they have internal and privately owned cognitive processes. This approach remains noncognitivist, in that it does not seek to explain conduct by reference to cognitive states (such as motives or attitudes); however, these sorts of cognitive objects do become the focus of study (Edwards & Potter, 2005).

DP is characterized by three basic themes:

1. *Respecification and critique.* Topics typically considered to be cognitive processes are re-specified in terms of the discourse practices that they are part of. DP is a study of the way in which people report and explain actions and events as part of everyday and institutional activities. This focus on action often generates a critical stance on the view of cognition we have discussed above.
2. *Psychological thesaurus.* DP explores the situated uses of the psychological lexicon, with terms such as *angry*, *know*, *believe*, and *want*. These studies are grounded in empirical materials and demonstrate the specific and rhetorical uses of the concepts in interaction.
3. *Managing psychological implications.* DP also examines how psychological themes are handled and managed in situations in which they are not overtly labeled as such. These sorts of themes (such as agency, doubt, motive, intention, prejudice, and so on) can be produced or countered indirectly in talk. These may not be explicitly named or described but can be handled through event descriptions.

To illustrate the work of DP, let's consider an example of research in this area that explores both the explicit use of psychological terms and the way psychological themes

are inferred and managed in the turn-by-turn context in which they occur. Excerpt (1) is a fragment from an hour-long counseling session in which Connie and Jimmy (wife and husband) talk about their problems with each other. It is analyzed in more detail elsewhere (Edwards & Potter, 2005). The speaker here is Jimmy.

- (1) [DE-JF:C2:S1:p.9]
 01 And uh:: (1.0) Connie had a short skirt on
 02 I don't know.
 03 (1.0)
 04 And I knew this- (0.6) uh ah- maybe I had
 05 met him.
 06 (1.0)
 07 Ye:h. (.) I musta met Da:ve before.
 08 (0.8)
 09 But I'd heard he was a bit of a la:d ().
 10 He didn't care: (1.0) who he (0.2) chatted
 11 up or (.) who was in Ireland (.) y'know
 12 those were (unavailable) to chat up with.
 13 (1.0)
 14 So Connie stood up (0.8) pulled her skirt
 15 right up her side (0.6) and she was looking
 16 straight at Da: ve (.) >°like that°< (0.6) and
 17 then turned and looked at me (1.2) and then
 18 she said w- (.) turned and then (.) back to
 19 Dave and said (.) by the way that wasn't
 20 for you.

In this extract Jimmy builds a picture of his wife as flirtatious, with his description in line 1 *Connie had a short skirt on*, depicting her as dressed in a sexually relevant or provocative way. In this way he makes his jealousy reasonable (unlike Connie's description of Jimmy as an endemically and recurrently jealous person), and Connie's behavior as inappropriately directed at a reputed *bit of a lad* named Dave (line 9). We can also see not only how the descriptive details included work, but also how important what might have been mentioned but is missing is. Of all that she wore, it is only the *short skirt* that is mentioned, and of all the skirt's describable characteristics, only its brevity is remarked on.

The description is positioned sequentially immediately before (and thus hearably relevant to) the introduction of Dave. We can hear Connie's motivation and character being set up here, as flirtatious, sexy, and targeting Dave (explicitly, in lines 15–16). These specific words, “sexy” and “flirtatious,” are ours and not definitive, but the point is that something like that is implicitly conveyed. Rather than its being done overtly, those kinds of characteristics are made available inferentially. Connie's character, motives, and intentions (psychological matters) are built and countered by descriptions of witnessable things—her skirt and her actions, the proximity of those things to the descriptions of Dave, and their place in the narrative sequence.

Within this extract there is also the use of an overt psychological term, *I don't know*, in line 2. A cognitivist approach may hear this as simply an assertion of ignorance or uncertainty; however, looking more closely you can see that it is said parenthetically, with no explicit object. By examining it within its sequential context it is possible to see how it attends to Jimmy's own character, which as Connie has described is purportedly jealous, suspicious, and prone to obsessive monitoring of the details of his wife's clothing and behavior. The use just here of *I don't know* counters that by implying that he wasn't paying particular attention. This kind of interpersonal use of *I don't know* or *I dunno* in a

parenthetical way (rather than as an answer to a factual question) has been found across a range of materials as a way of handling the speaker's stake or interest in the content of a description (Potter, 1998). The way that discourse handles psychological categories is not just a matter of using overt psychological labels; expressions such as *I don't know* can do interactional work by attending to potential commonsense inferences.

Puzzles and Possibilities: What Are the Implications for Traditional Notions of Cognition?

Although uses of cognitive concepts such as *I don't know* are not independent of what *know* signifies as a "concept" or its dictionary definition, what people do when they use these terms (as Jimmy does in the extract above) is not well catered for by this "conceptual" understanding. The DP analysis highlights the distinction between this approach and a cognitivist explanation. The differences lie in both metatheoretical assumptions and methodological practices. Interactional research of this kind underscores the difficulty with considering the actor as a socially isolated problem solver, and makes plain the need to take account of socially shared and conventionalized procedures of interaction.

DP eschews psychological reduction and approaches cognitive issues as a topic of study from a practical and interactional perspective rather than as objects that explain conduct. It is not yet clear whether this form of research will satisfy the agendas of cognitive scientists seeking to explore the cognitive realm. Disagreements in theories of language (as abstractly representing cognitive objects rather than action-oriented) and very different methodological approaches (experimental studies versus descriptively based inductive studies) undoubtedly generate tensions. There is, however, across these fields immense potential for the building of fruitful (though complex) debate between cognitive scientists and interactional researchers.

Discourse and Identity

ANNA DE FINA

The relationship between language and identity has been a topic of interest for language scholars for centuries. As early as in the 1800s many philologists, including the famous brothers Jacob and Wilhelm Grimm, were proposing the idea that language reflected the collective identity of national communities. Benveniste (1971), one of the most important linguists of the 20th century, also stressed the centrality of identity in language through the notion of subjectivity. In his view, the direct or indirect presence of the speaker as a subject in the utterance had the power to transform language as an abstract system into discourse as an act of communication. In sum, theorizations about language and identity have always had a significant place in linguistics, but it is only in the last 20 years that this field has established itself as an area of investigation in its own right and as a field fundamentally concerned with discourse. Indeed, modern research on ways in which identity is constructed and conveyed in talk is firmly grounded in a view of language as discourse, that is as “actual instances of communication in the medium of language” (Johnstone, 2002, p. 2), and as phenomena embedded in concrete social contexts.

Because of its fundamentally cross-disciplinary status, the field presents a daunting variety and dissimilarity of theoretical and methodological orientations, thus fragmentation and eclecticism are widespread. This is partly due to the elusiveness of the concept of identity. Identities can be regarded as collective or individual, as social or personal, as mental constructs or as the product of actions. At the same time, language can be seen as reflecting, conveying, constructing identities or as carrying out all those functions at the same time. Discursive approaches to identity differ, among other things, on the role that they assign to language in the communication or construction of identities and on the type of identities that they study. With respect to the first point, although most scholars would agree that language both reflects and creates identities, the stress is usually placed on one or the other (not both) of these two processes. With respect to the second point, while some researchers deal primarily with social identities such as ethnic, gender, or class categories of belonging, others focus on personal identities, in other words on discursive projections about the persona as a whole; yet other researchers deal with collective, abstract constructs such as national or political identities. These differences notwithstanding, modern discursive conceptions about identity have, in one way or another, all been influenced by social constructionism. Inspired by the work of phenomenologists such as Berger and Luckmann (1967), social constructionists view the relation between the individual and the social world as one of mutual constitution. They argue that, although the social world appears to human beings as an objective reality, it is in fact constituted through human action and interaction and is not independent of it. From this perspective, people continuously create and recreate social reality and in turn are shaped by it in a dialectical process. Thus, identity is not seen as a concept that resides in the mind of the individual self, but rather as a process of construction that has its locus in social interaction. Another important point that social constructionist thinkers emphasize is that people do not have one unique and homogeneous identity but manage a complex inventory of possibilities for self-presentation. These notions are widely accepted in the field and underlie the work of most recent approaches to the study of identity.

In order to highlight the contributions and methodologies of different orientations it is useful to subdivide them according to the type of identities that they analyze. Thus, discursive approaches to identity are divided below into two main categories: those that deal primarily with social identities, and those that focus on personal or biographical identities.

Social Identities in Discourse

Identity is often described in terms of people's sense of membership of social categories (Tajfel, 1981), but discourse analysts stress that language has a fundamental role in expressing and constituting such a sense of belonging. The linguistic anthropologist Kroskrity (1999, p. 111) for example defines identity as "the linguistic construction of membership in one or more social groups or categories." Social identities are large categories that may constitute points of reference for identification such as those pertaining to race, gender, age, or ethnicity. Thus, individuals and groups may describe themselves, for example, as males or females, as young or old, as Black or White. Two kinds of approaches have greatly contributed to current understandings about the interconnections between discourse and social identities: sociolinguistics approaches and conversation analytical or ethnomethodological approaches. Both these orientations share a focus on social practices (i.e., practical forms of social organization) and interaction as the central locus for the study of identity.

Sociolinguistic approaches have grown out of research on language variation, that is the study of how language changes according to the identity of speakers and the social contexts in which their talk takes place. In traditional sociolinguistic treatments of language variation, identity was seen as a variable that determined differences in language use. Classic sociolinguistic studies posited a correspondence between the social identity of a speaker (in terms of social class, gender, age, etc.) and the kind of language that this speaker would naturally produce. For example, in his studies about the American vernacular, the sociolinguist Labov (1972) illustrated how membership into categories such as class and age determined the way people pronounced the sounds of English. In his work, language was seen as reflecting the identity of the speaker. Such simple equation between social-identity categories and language use was later contested by proponents of accommodation theory (Giles, Coupland, & Coupland, 1991) who argued that speakers may change their accent and other prosodic, syntactic, and discursive aspects of their language within the same interaction in response to their interlocutors' identity by adapting to the speech of their interlocutors or, alternatively, diverging from it. Accommodation theory introduced two important elements in sociolinguistic theorizations about identity: the recognition that identity is an ongoing process related to all the participants in an exchange (not simply to the speaker), and the shift from the study of isolated linguistic elements to the analysis of discourse phenomena that, as we saw, is characteristic of recent orientations.

Sociolinguistic research that developed in the 1990s further refined this approach to identity by focusing on fine-grained analyses of how speakers use language varieties to convey and negotiate different kinds of social identities. A great deal of attention was devoted to the construction of ethnic and gendered identities in particular. Work on ethnicity demonstrated that there was no one-to-one correspondence between the use of an in-group ethnic variety (i.e., language spoken by members of the same group) and the expression of allegiance to that group. The work on language crossing of the British sociolinguist Rampton (1995) was particularly significant in this respect. The author demonstrated that young people in inner-city British schools creatively used and mixed language varieties that were not associated with their own ethnic group to express and negotiate a variety of identities in interaction. Research on code switching (i.e. the use of different languages within the same utterance) proceeded along the same lines, arguing that the use of in-group

language varieties was not automatically associated by speakers to claims of in-group identity (Auer, 1998).

Deeply influenced by the theorizations of the American sociologist Goffman (1981) on the centrality of interaction for understanding human behavior, these studies have in common the painstaking attention to the details of face-to-face interaction and to the symbolic strategies employed by participants to index their different identities. This research, together with investigation on gender identities (Eckert, 1995), has contributed to the development of a new paradigm dominant in the last decade in which associations between uses of language and social identities are not presupposed, but carefully investigated through the study of how identities are expressed and managed in the concrete social practices in which individuals and communities are engaged. Thus, sociolinguists study, for example, specific communities and the ways in which members convey and negotiate identities within typical activities and situations.

One of the offsprings of this theoretical–methodological orientation has been a shift in focus from the individual linguistic variables (sounds, accents, words) to styles, seen as combinations of different features such as accents, words, rhythm. According to the anthropologist Irvine (2001), styles crucially concern distinctiveness in that people adopt them in order to signal their identity as different from the identity of others. Underlying the research discussed above is the idea that, although identity may be openly proclaimed through linguistic means, it is often indirectly and symbolically conveyed. Sounds, words, expressions of a language and styles are continuously associated with qualities, ideas, situations, social representations, entire ideological systems. These in turn are related to social groups and categories that are seen as sharing or representing them. These associations are the most important basis for stereotyping, as social identities are paired with specific uses of language. The process of pairing language with symbolic meanings (and identities) is commonly referred to as *indexicality*, based on the idea that linguistic symbols “index” (Silverstein, 1976), or point to, elements of the social context through a process of meaning creation that rests on accepted social meanings while continuously modifying them. Thus, it may be said for example that the frequent use of the discourse marker “like,” together with other linguistic elements, may index “youth” in the speech of an individual. But such association is not fixed and may disappear in time or across contexts.

Another important theoretical methodological frame for the study of identity, the talk-in-interaction approach, has been proposed by scholars close to conversation analysis and ethnomethodology. The focus of these disciplines is the study of language as a form of social action (conversational analysis) and the investigation of how everyday people go about communicating and understanding each other (ethnomethodology). Therefore, proponents of this movement are interested in how people perform social identities in natural situations of interaction. Among the central ideas proposed are the following (see Antaki & Widdicombe, 1998): First, having an identity means being cast into a category related to certain characteristics. Thus, identities are connected to social categories that are defined on the basis of their association with properties and activities. Second, associations between identities and social categories are not fixed, but indexical, in the sense that they can vary widely according to participants and social contexts. Third, identities are occasioned, that is they are invoked, made relevant, and negotiated within particular discursive exchanges, so they should not be seen as “belonging” to the individual or the group. Proponents of the talk-in-interaction movement emphasize that identities need to be made relevant in order to be significant in an interaction. Thus, they caution researchers against deciding in advance which identities may be important for participants in a communicative exchange. In other words, talk-in-interaction proponents believe that it does not make sense to analyze how, for example, being Black or White may affect the discourse of specific people, but that these social categories may be used by the analyst only when it is clear that they

are important to participants in an interaction in that they are directly or indirectly invoked by them.

As seen above, talk-in-interaction analysts build on a close association between categorization and identity construction, an idea that was already present in a number of lectures delivered by the sociologist Sacks (1992), who saw the discursive management of social identities as based on the process of relating categories to specific roles and activities. Indeed a core trend within talk-in-interaction approaches to identity has been membership categorization analysis (Hester & Eglin, 1997), a movement that has focused on the study of the specific ways in which participants in interaction ascribe to each other membership into social categories and create, discuss, and negotiate their meaning.

While sociolinguistic and conversation analytic approaches focus on social identities such as ethnicity and gender, collective identities, such as national or political ones, have been a privileged object of investigation for proponents of critical discourse analysis (Fairclough, 1989), that is scholars interested in using discourse analysis to fight social inequalities and prejudice. Critical discourse approaches to identity differ from social constructionist ones in that they have a sociocognitive-based conception of identities. This means that they see them as mental constructs that have a certain cognitive reality and that are constituted, among other things, by shared mental representations about self and others. These representations may be forms of knowledge, ideologies, attitudes, emotions, norms, and values (Van Dijk, 2009). Critical discourse analysts regard social identities as relatively stable constructs that exist in the minds of social actors before they engage in interaction, are not constituted in it, and are activated when people use them within concrete social occasions. Of course, social identities may be modified in interaction, but they have a strong cognitive component since they are learned through socialization and different discourse practices implemented within institutions such as education, public discourses, and mass media. Unlike social constructionist approaches, critical discourse analysis focuses on the expression of identities within large corpora (for example political speeches, public documents, newspaper articles, etc.) and pays more attention to language structures than to interaction. Researchers in the area focus on the analysis of topics, discourse strategies used to create and transform identities (for example strategies of inclusion or exclusion), and linguistic forms used to discursively convey them (for example pronouns and passive or active syntactic constructions). In studies of national (Wodak, de Cillia, Reisigl, & Liebhart, 1999) and political identities (Wilson, 1990), therefore, questions of agent responsibility and of ideological positioning are central.

In recent times scholars have also started approaching identity from a multimodal perspective. Multimodal discourse analysts regard identity as constructed through a variety of actions that can be realized not only in the discursive mode, but also in "other modes including gesture, gaze and posture" (Norris, 2007, p. 655). Such orientation greatly expands the range of phenomena that are regarded as pertinent for the discursive communication of identity.

Personal Identities in Narrative

The prime site for the analysis of personal identities within discourse studies has been narrative. The concept of personal identity has traditionally been related to the idea of the "self," but the view of the self that narratives may reflect or constitute is by no means uncontroversial. Indeed, while in many psychological theories of personality the self is seen as rational and unitary, observers of postmodern societies such as the sociologist Giddens (1991) regard it as essentially fragmented and discontinuous. Thus, there are profound disagreements among social scientists as to what the self is and how it is expressed

in language, but many scholars have converged on the study of narrative as the most important locus for its communication or constitution. This idea has been particularly central to the work of analysts associated with the so-called “narrative turn” in the social sciences (Polkinghorne, 1991; McAdams, 1993), a movement advocating the use of narrative as a research tool for collecting data and analyzing social phenomena. For many of these analysts the study of narrative is a point of entry into the teller’s personal, social, and cultural identities. Thus, many “narrative turn” analysts propose a discursive biographical approach to identity. For example the psychologist McAdams states that identity is a life story (1993, p. 5) that individuals construct throughout their existence in order to give it meaning. Similarly, according to psychologist Bruner (1994, p. 53), people find their identities by becoming “the autobiographical narratives that they tell.” These ideas have roots in theorizations about narrative that saw it as essential in providing unity and meaning to human experience. One such theory was proposed by the philosopher Ricœur (1984), who regarded narrative as constitutive of identity since it is through narratives that we know who people are. The biographical approach to narrative focuses on the way in which individuals construct their sense of self through the stories they tell, and therefore places emphasis on the themes of the stories and how they are strung together as a type of map of individual identities.

In other, more linguistically oriented approaches (see De Fina, Schiffrin & Bamberg, 2006), narrative is seen as an occasion for the discursive constitution of identity, not as an expression of it. Key to linguistic approaches are constructs that capture the dialogic nature of identity, the idea that identity is a process in which there is always implicitly or explicitly some “other.” In that sense, narrative has been a fertile genre for exploring the variety of roles that narrators can exploit to convey identities because telling a story implies both constructing a fictional world and dealing with an interactional one. Narrative analysts have taken inspiration from Goffman’s concept of “footing,” or “the alignment we take up to ourselves and the others present as expressed in the way we manage the production or reception of an utterance” (1981, p. 128). His proposed decomposition of the speaker into *author* (the agent that created the talk), *animator* (the agent uttering the talk), *principal* (the agent responsible for the talk), and *figure* (the character in the story) has been fruitfully applied to analyze identity in narrative. The idea of a dialogical self also underlies the important notions amply applied in narrative studies of positioning (Bamberg, 1997) and performance (Bauman, 1986). Positioning captures the fact that when telling a narrative people take positions not only toward the characters and events depicted in their stories, but also toward their listeners and the social issues at stake. These positions define the images of themselves that they want to negotiate in specific contexts. The idea of performance reflects the fact that telling the self constitutes an act of identity and that being someone is a form of doing. Performance also points to the “theatrical” strategies that people employ in order to index their identities.

It is important to keep in mind that investigations of social and personal identities are not as separate from each other as one may deduct from the exemplification above. Indeed, personal identities usually comprise allegiance to social identities, and on the other hand social identities are indexically associated with personal qualities.

Discourse and Interaction: Quantitative Methods

BELINDA CRAWFORD CAMICIOTTOLI

In discourse studies, the term *interactional language* broadly refers to language used by speakers and writers to establish and maintain interpersonal relations. Together with the analysis of form and meaning, discourse analysts explore the interactional dimension of language to understand the underlying social and cultural dynamics that characterize communication. Interactional language can be distinguished from transactional language, which is instead concerned with conveying messages and information (Brown & Yule, 1983). Interaction in discourse has been studied from at least three research perspectives. Within the tradition of conversation analysis (e.g., Sacks, Schegloff, & Jefferson, 1974), interaction is studied through question–answer sequences, back-channel markers (e.g., *yeah*, *mm hm*), and interruption markers (e.g., *excuse me*). Research grounded in interactional sociolinguistics (e.g., Gumperz, 1982) has investigated features such as forms of address (e.g., *Charlie*, *darling*) and markers of social rank (e.g., *madam*, *reverend*) that shed light on the roles of the discourse participants (Levinson, 1988). However, interaction is not limited to speech. It also comes into play when writers choose specific language for their texts as a way to engage readers in their arguments (e.g., *What would you say if . . .*). Like speakers, they accomplish this with interactional elements such as questions, first- and second-person pronouns, and positively or negatively charged vocabulary (Thompson, 2001).

In recent years, the methodologies of corpus linguistics have greatly expanded opportunities to study interaction in written and spoken discourse by making it possible to systematically analyze relatively large quantities of electronically stored language. Studies that use corpus tools are able to automatically retrieve items of interest and generate quantitative data, which is used as empirical evidence of how interaction is reflected in discourse. Although corpus linguistics is often associated with large-scale language research based on multimillion-word corpora, such as the British National Corpus, corpus techniques are also useful for analyzing smaller corpora in a two-phase operation: a preliminary computerized processing phase followed by the researcher's interpretive phase (Sinclair, 2001). This approach is particularly effective when working with corpora of specialized language with a specific research objective in mind, recently characterized by Partington (2007, p. 1547) as *corpus-assisted discourse study* (CADS).

The example of CADS provided here illustrates how interaction in discourse can be analyzed using quantitative methods. The study investigates interactional features of classroom discourse, in particular adjectives used by a professor of economics to express positive and negative attitudes toward content during a lecture. Specifically, this research aims to answer the following questions:

- Which adjectives are used to express positive and negative attitudes?
- Which types of adjectives are used more frequently than others?
- How are the adjectives distributed throughout the discourse?

In discourse analysis, positive and negative adjectives are considered to be resources for expressing evaluation, that is, language used to express feelings, opinions, and attitudes

The Encyclopedia of Applied Linguistics, Edited by Carol A. Chapelle.

DOI: 10.1002/9781405198431.wbeal0327

(Thompson & Hunston, 2000). When speakers or writers evaluate some entity as good or bad, they communicate their own values, staking out a position that may or may not be shared by others, and thus they move onto the interactional plane of communication. In teaching contexts, it is important to understand how evaluative adjectives are used by lecturers as key indicators of attitudes to convey their personal interpretation, and thus reinforce the lecturer–student relationship (Northcott, 2001).

This study utilizes a dataset extracted from the transcript of a lecture on the Japanese economy given at a British university. Data for computer-assisted discourse analysis can be procured in several ways, depending on the type of language needed and the research aims. For example, written data can be scanned from print or downloaded from online materials; spoken data can be obtained from pre-existing transcripts collected from the Internet or other sources, or recorded live and then transcribed into electronic files.

Identifying and Accessing the Data

The lecture data were collected for a research project targeting interaction in spoken academic discourse. After establishing contact with a lecturer who agreed to participate and authorize the use of his lecture, the lecture was recorded during a normal class period and subsequently sent to the researcher for transcription. The lecturer is a native speaker of British English and a highly experienced educator. The audience was made up of about 150 undergraduate students who were mostly native speakers of British English.

Transcribing the Speech

The lecture was transcribed into an electronic file by keyboarding the speech heard on the audiotape. However, before embarking on transcription, it was important to decide precisely what to describe and how to transcribe it (Bucholtz, 2000). Given the aim of the research, it was decided to transcribe features that could be relevant on an interactional level, including dysfluencies (e.g., pause fillers, false starts) and phonological reductions (e.g., *wanna*). Features of prosody (e.g., stress, intonation, vowel-stretching) were not transcribed as they were beyond the scope of the research. During transcription, appropriate markup was inserted based on conventions used in the Michigan Corpus of Academic Spoken English (MICASE; Simpson, Briggs, Ovens, & Swales, 2002) to indicate short pauses (.) and unintelligible speech (xx). False starts and repairs were also transcribed (e.g., *in the in the*). In addition, important contextual information about the event was typed within the characters “< . . . >” so that it would not interfere with automatic processing, but still be retrievable.

Preparing the Data for Automatic Processing

After transcription and markup, the data were saved in text-only format (i.e., a .txt file) to permit processing with two programs. The file was first run through the CLAWS4 (Constituent Likelihood Automatic Word Tagging System) part-of-speech (POS) tagger, a program developed by the University Centre for Computer Corpus Research on Language of Lancaster University (UK). The tagger automatically attaches a label (or tag) to each word that indicates its part of speech. When targeting an open word class (e.g., adjectives) rather than a finite set of items (e.g., personal pronouns), POS tagging is the most effective way to carry out accurate and exhaustive analyses. Figure 1 provides an illustration of the CLAWS tagging process. The untagged text file is first opened into the left column of the program screen, the tagger tool (JClaws—the graphical user interface to the underlying

Figure 1 Sample of the tagging procedure (screenshot from the JClaws GUI for the CLAWS tagger program developed by UCREL, Lancaster University, UK)

Table 1 CLAWS tag legend (adapted from the UCREL CLAWS7 tagset retrieved from <http://ucrel.lancs.ac.uk/claws7tags.html>)

Tag	Lexico-grammatical item
PPIS2	1st-person plural subjective personal pronoun
VBR	are
VVGK	-ing participle catenative
TO	infinitive marker
VVI	infinitive
II	general preposition
NN1	singular common noun
MC	cardinal number
RT	quasi-nominal adverb of time
DDQ	<i>wh</i> -determiner
VBZ	is
AT1	singular article
UH	interjection
NN2	plural common noun
AT	article
JJ	general adjective

CLAWS tagging system) is then selected from the menu, and the tagged text then appears in the right column (see Table 1 for the tag legend). The tagged lecture transcript is then saved as a separate file for further elaboration.

Processing and Editing the Data

The saved tagged file was processed with WordSmith Tools (Scott, 2004) software suite, specifically with the concordancer. This is a tool that finds each occurrence of a particular

The screenshot shows the Concord window with a menu bar (File, Edit, View, Compute, Settings, Windows, Help) and a toolbar. The main area displays a list of concordance lines. The first column is labeled 'N' and the second is 'Concordance'. The third column is 'Word #'. The search item 'JJ' is highlighted in the first column. The concordance lines are as follows:

Figure 2 Sample of concordance lines (screenshot from WordSmith Tools, Scott, 2004)

word or phrase (the search item) and displays it in a vertical list of lines in which the search item is positioned at the center of the line, accompanied by a few words to the left and right to provide some context. To analyze evaluative adjectives in the lecture extract, a search was run on the general-adjective tag “JJ.” In this way, it was possible to retrieve all words classified as general adjectives. The search returned 239 concordance lines with each adjective appearing to the left of the tag “JJ” (see concordance sample in Figure 2).

By default, the retrieved concordances are listed chronologically in the order in which items occur in the file. However, concordancers usually include a re-sorting function that allows users to order retrieved lines in different ways. This makes it much easier to group items and to discover interesting trends and patterns. Figure 3 shows a sample of concordance lines re-sorted by the first word to the left of the search item “JJ,” thus displaying all instances of adjectives grouped and listed alphabetically.

The re-sorted data were then relatively easy to edit. Because the objective was to obtain frequency data for adjectives that explicitly express positive and negative attitudes, it was necessary to weed out many adjectives that did not do so in this context (e.g., *American* in lines 2–4 and *big* in the last line of Figure 3). The grouped adjectives could be quickly

The screenshot shows the Concord window with a menu bar (File, Edit, View, Compute, Settings, Windows, Help) and a toolbar. The main area displays a list of concordance lines. Figure 3 Sample of re-sorted concordance lines (screenshot from WordSmith Tools, Scott, 2004)

assessed in order to select unwanted neutral items for subsequent removal from the data. The distinction between positive/negative and neutral adjectives was usually rather straightforward. However, in some cases, positive or negative meaning could not be interpreted without seeing more text than what appears in the concordance line. This was done by activating a function that allows the item to be viewed in expanded text from the source file. For example, in line 1 of Figure 3, the connotation of the adjective *amazing* is not clear, so it was necessary to identify what was being described. Here the lecturer was referring to a series of economic crises that took place in Japan, so it turned out to have a negative sense. The adjective *competitive* also had to be interpreted in context. Although it does not inherently express an attitude, here the lecturer used it to evaluate companies in a positive way.

Displaying the Results

Once the list had been edited, it contained 30 concordance lines with both positive and negative adjectives. This output was further edited to select and save positive adjectives into one concordance file and negative adjectives into another. All the positive and negative evaluative adjectives used by the lecturer, along with their frequency counts, are listed in Table 2.

From the concordance lines, dispersion plots were computed, as shown in Figure 4 (positive adjectives) and Figure 5 (negative adjectives). Dispersion plots provide a visual image of the distribution of search items throughout a text, moving from the left (beginning of the text) to the right (end of the text). Each vertical line in the plot represents an occurrence of a positive (Figure 4) or negative (Figure 5) adjective. In addition, the plots show the source-file name, total words in the file, frequency count of the search item (hits), and the normalized parameter of number of occurrences per 1,000 words. The latter is useful when working with two or more datasets with different word counts. In that case, a simple comparison of raw frequencies would not give an accurate picture of variation across datasets. In addition, the plot reports the dispersion value that measures the uniformity of the dispersion, ranging from 0 (least uniform) to 1 (most uniform).

Grand total			30

Interpreting the Findings

In this computer-assisted discourse analysis, the interpretive phase is of vital importance. Although empirical results yield interesting descriptive information, they offer little insight into the possible motivations underlying usage. The main findings of the quantitative analysis were that negative adjectives ($n = 24$) were four times as frequent as positive adjectives ($n = 6$) in this lecture extract, and also three times as varied, with 15 different negative adjectives versus only five different positive adjectives (see Table 2). To advance possible reasons for these differences, it was necessary to go beyond the data and consider the larger context of interaction. On a textual level, the content of the lecture that focused primarily on the problems of the Japanese economy likely influenced the high frequency of negative adjectives. This may also have triggered their wider variation, seen in the lecturer's choices of *amazing*, *dodgy*, *depressing* as creative alternatives to the more common *bad* or *negative*. On a broader disciplinary level, because economics has the fundamental objective of teaching learners to critically analyze economic problems, it stands to reason that negatively charged vocabulary would be relatively prominent.

The dispersion plots (Figures 4 and 5) indicate that the evaluative adjectives tend to cluster toward the end of the discourse. Follow-up analysis of these items in their context of usage showed that, in this part of the lecture extract, the lecturer evaluated the level of competitiveness and efficiency in diverse sectors of the Japanese economy, using both positive and negative adjectives (e.g., *competitive*, *uncompetitive*, *efficient*, *inefficient*) to point out important contrasts.

This analysis was based on an excerpt from an economics lecture as a way to exemplify the use of quantitative methods to investigate evaluative adjectives, which represent one form of interactional language in discourse. In particular, text analysis tools were used to produce descriptive profiles of positive and negative adjectives (i.e., their types, frequencies, and distributions) as outlined in the research questions. In larger-scale research, the dataset would include a large number of complete lectures given by different speakers on other topics of economics. The ideal size and composition of the dataset would depend on the purpose of the research. For research comparing disciplinary language, a contrastive analysis could be performed on economics lectures versus lectures in other subject areas.

For readers who would like to experiment with the quantitative descriptive techniques described above, the Michigan Corpus of Academic Spoken English (MICASE; Simpson et al., 2002) is an excellent source of transcribed spoken data that is freely available for research purposes. MICASE contains 1.8 million words of speech varieties that typically occur on a university campus (e.g., lectures, student presentations, advising sessions, dissertation defenses). It can be accessed at <http://lw.lsa.umich.edu/eli/micase/index.htm>. The MICASE site also provides a user-friendly search tool that generates frequency statistics and re-sortable concordance lines. Moreover, readers may refer to the CLAWS Web site at <http://ucrel.lancs.ac.uk/claws/> for detailed information about this POS tagger. The site also provides a free online trial service that allows users to practice tagging text samples.

Discourse in Action

RODNEY H. JONES

One of the most fundamental issues in discourse studies is understanding the relationship between what we say and write and what we do, that is, the relationship between *discourse* and *action*. Nearly all mainstream approaches to discourse analysis begin with the assumption that discourse itself *is* a kind of social action. Conversation analysts, for example, see talk as a matter of “paired action,” genre analysts speak of genres as examples of “communicative actions,” interactional sociolinguists focus on how people strategize discursive actions within an ongoing negotiative process with other social actors, and critical discourse analysts remind us that discourse constitutes and is constitutive of what they call “social practice.”

The problem with approaches that conceptualize discourse *as* action is that there are a whole host of actions that we engage in everyday that do not involve discourse, or only involve it in a rather peripheral way, but still have an important relationship to discourse that may have been produced before these actions are carried out or may somehow follow from these actions. Scollon and Scollon (2005) discuss, for example, the actions involved in lighting a camp stove, actions which for experienced campers might not involve any talking or engagement with written text, but which invariably arise out of a complex history of discursive actions such as the writing and reading of advertisements, manuals, packages, and warranties or oral instructions given by an expert user to a novice. These actions subsequently give rise to other discursive actions such as the conversations that accompany the meals which the stove was used to prepare or written reviews posted online by satisfied (or dissatisfied) users of the stove, or papers filed in lawsuits by customers who have been injured using the stove.

Mediated discourse analysis is less interested in understanding discourse *as* a kind of social action and much more interested in understanding it insofar as it plays a role *in* the performance of social actions. This concern has its theoretical foundations in the work of the Soviet psychologist Lev Vygotsky (1981), who near the end of his life became interested in the notion of *mediation*. For Vygotsky, all human action (and thought) is mediated through cultural tools, some of which are physical (such as screwdrivers, camp stoves, and physical texts of all kinds) and others of which are psychological. Among what he termed “psychological” tools he included “language; various systems for counting; mnemonic techniques; algebraic symbol drawings; all sorts of conventional signs” (Vygotsky, 1981, p. 137).

The status of discourse as a *cultural tool* through which we mediate social action is not entirely clear-cut. On the one hand, we might consider discourse to be more of a *psychological tool*, given that it draws upon languages and signs. For mediated discourse analysts, however, (as for most discourse analysts), the interest is not so much in the “system” (be it language, algebra, or any other sign system) as it is in the instantiation of that system in concrete instances of use in which the system is embodied in some kind of material expression (i.e., a written text or sound waves spoken or broadcast). In other words, although mediated discourse analysts are certainly interested in how people form texts by drawing upon various semiotic systems, social languages, and speech genres (Bakhtin, 1986), their main concern is with discourse as a *physical object* that is used to take actions

2 DISCOURSE IN ACTION

in the world. Therefore, the main concern is not what discourse *means* (as in many branches of linguistics), nor what it *does* (as in pragmatics and other similar approaches to discourse and social interaction), but what people *do* with it, and how these *doings* (not the discourse) work to construct individual identities and communities of practice (Lave & Wenger, 1991).

This formulation takes the traditional definition of discourse as “language in use” one step further: “language in use to *do something*.” That “something” that discourse is used to do, not the discourse itself, is the starting point for mediated discourse analysis, for which any exploration must begin with Goffman’s (1974) famous question: “What’s going on here?”

Although many forms of discourse analysis are predicated on the notion that meaning is inseparable from “what’s going on,” that is, that discourse gets its meaning from the social practices in which it is embedded (Gee, 1999), most of these approaches conceptualize social practices in rather vague and generalized ways (e.g., having a meeting, eating in a restaurant), or as “social practice” (as a mass noun). This latter formulation, favored by many cultural critics, takes the notion of practice to an even greater level of abstraction, referring often to situations or forms of social organization rather than to people actually taking action in the world. An approach that focuses on discourse in action is less interested in these generalized social practices (or this notion of social practice) as categorical “types” of actions or relationships and more interested in the real time, unique, and irreversible actions that actually go into creating these larger situations and social formations. When practices are considered, they are considered as the “technologization” of particular sequences of actions that have become recognizable to particular groups as representing particular activities and identities. Even then, however, the focus remains on the discrete actions from which these practices are constructed, and how these actions are related to one another in chains of “conditional relevance,” so that one particular action arises out of the actions preceding it and creates the conditions for the actions that follow (Jones & Candlin, 2003).

The notion of discourse *in* action, however, is not as simple and straightforward as it seems. In fact, one of the consequences of approaching discourse through action (as opposed to approaching action through discourse) is a new awareness of the problematic relationship between discourse and action, a realization that we cannot always read social actions from discourse or expect particular kinds of discourse to be used to perform particular kinds of actions. In his study of discourse about HIV/AIDS, for example, Jones (2007) found that talk about “safer sex” is often used to perform actions that have very little to do with safer sex, and, in fact, are sometimes part of patently unsafe sexual practices. In other words, discourse does not *cause* actions and actions do not *cause* discourse in any direct way. Rather, discourse and action exist in what Wertsch (1994, p. 205) calls a relationship of “tension between the mediational means as provided in the sociocultural setting and the unique contextualized use of these means in carrying out particular concrete actions.”

At the center of an approach that focuses on discourse in action, then, is a preoccupation with who or what is responsible for actions that occur in the world, in other words, what the source of *agency* is. Traditional views of agency have seen it as a matter of individual intentionality or power. Mediated discourse analysis, on the other hand, views agency as a matter of the interrelationship among social actors, the cultural tools (including discourse) they are using (and the various affordances and constraints they embody), and the social circumstances in which they find themselves (including the ideological formations and relations of power that characterize these circumstances).

This focus on discourse in action has a number of practical advantages for the analyst, perhaps the main one being that it helps to solve the problem of deciding which discourse is worth analyzing and which is not. Many approaches to discourse make this choice based

on the particular theoretical concerns of the analyst rather than the real life concerns of those who actually produce and consume the discourse they are analyzing. As a result, while such studies often make important contributions to the advancement of theory, their contribution to solving the real problems of real people is sometimes less clear.

In contrast, a discourse in action approach typically begins with a site survey, a step that the Scollons (2004) refer to as “engaging the nexus of practice.” Such a survey involves identifying the key social actors, the key actions, and the key cultural tools in a particular situation from the point of view of participants themselves through methods like interviewing and observing. The purpose of these interviews and observations, however, is not to gather data, but rather, to develop, in collaboration with participants, an understanding of the kind of data that needs to be gathered.

The phrase “discourse in action” also points to a vision of an *engaged* discourse analyst, one who, rather than standing apart from the people and actions he or she is studying, acknowledges that to study any social phenomenon involves being part of it, that “objectivity” is neither possible nor necessarily desirable. Thus, another important aspect of “engaging the nexus of practice” involves the analyst establishing what the Scollons call a “zone of identification,” an understanding of where and how the interests of the participants and the interests of the analysts overlap, a thorough inventory of the perceptual limitations and biases of all concerned, and an examination of how these limitations and biases are inevitably part of any process of data collection and analysis. Mediated discourse analysts cannot stop at analyzing the actions of others, but must also face up to their own actions and how they affect the world that they analyze.

In the end, then, an approach that focuses on discourse in action points us toward the notion of the discourse analyst as a *social activist* who is actively engaged in helping people solve real world problems that are of immediate concern to them. It is not surprising, then that studies using this approach have focused on issues like HIV/AIDS prevention, racial discrimination, illegal immigration, and unemployment. While studies using this approach begin with “engaging the nexus of practice,” they should ideally end with “changing the nexus of practice” in some positive way. Obviously, what constitutes positive change is highly subjective and dependent on the “zone of identification” the analyst has established with participants at the outset of the research. What is really at the heart of this goal of transformation is a process through which analyst and participants work together to become more conscious of their own actions and the kinds of social relationships and social “selves” that they give rise to.

Where this brand of activism differs from that sometimes associated with other approaches like critical discourse analysis is that it is not focused on processes of uncovering power relations, identifying victims, and assigning blame. Rather, it focuses on understanding and helping others to understand that the solutions to problems often lie not in attempting to grapple with large abstract social practices and social formations, but rather in grappling with the mundane, situated, local actions by which we build our social worlds moment by moment.

In this way, approaches that focus on discourse in action are closely related to models of “participatory action research” (Freire, 1970), which emphasize useful knowledge, problem solving, and social change. Such models strive to transform people, organizations, and communities by reducing the gap between knowledge and action. What this means for us as discourse analysts is that research is not seen as an aim in itself, but rather as part of a process leading to some kind of action that will benefit stakeholders. What it means for us as human beings and the other humans we interact with is that action should never be seen as separate from inquiry, that whenever we engage in action, the potential for learning exists. To put it more concisely, analysis without action is sterile and action without analysis is dangerous.

Discourse in Organizations

ABZ SHARMA AND DAVID GRANT

The study of *discourse in organizations* (also referred to in the literature as “organizational discourse studies”) focuses on

the structured collections of texts embodied in the practices of talking and writing (as well as a wide variety of visual representations and cultural artifacts) that bring organizationally related objects into being as these texts are produced, disseminated and consumed through social interaction. (Grant, Hardy, Oswick, & Putnam, 2004, p. 3)

These discourses “are always connected to other discourses which were produced earlier, as well as those which are produced synchronically and subsequently” (Fairclough & Wodak, 1997, p. 277). This means that discourses in organizations are intertextual in nature; that is, they are constituted by other discourses and the texts therein (Fairclough & Wodak, 1997; Sillince, 2007). Thus, while some researchers focus on a specific text in isolation, others carry out intertextual analyses whereby they examine the relationship of a given text to other texts and are able to show that the meaning attached to any particular organization-related issue or incident unfolds through the complex interplay of both socially and historically produced texts (Grant & Hardy, 2004).

The study of discourse in organizations has emerged as a significant field of inquiry over the past three decades. It has provided scholars with alternative ways in which to describe, analyze, and theorize the increasingly complex processes and practices that constitute “organization” (Grant et al., 2004, p. 1). Research in the field has generally focused on the social constructionist (Berger & Luckmann, 1967; Searle, 1995) effects of language in organizational settings. Its theoretical and disciplinary antecedents originate from the broader domain of discourse theory such that it is informed by a variety of sociological, sociopsychological, linguistic, anthropological, philosophical, and communication based studies. Given these broad antecedents, it is perhaps not surprising that a variety of methodological approaches has been used that allows for the study of specific features and forms of discourse in organizations. Researchers have drawn on methodologies involving, among others, metaphorical analysis, critical discourse analysis, narrative analysis, rhetorical analysis, and conversation analysis. They have applied these methodologies to a host of organization-related issues in order to generate new insights. These have included organizational change, corporate strategy, professional and organizational identity, power relations in organizations, management fads and fashions, organizational learning, decision-making, inter-organizational collaboration, gender and ethnicity and organizational culture. The range of methodologies available to the researcher wishing to conduct empirical studies of discourse within organizational settings can be seen as a virtue (Phillips & Hardy, 2002). It assists discourse-focused research into organizations to study a variety of issues at a variety of analytical levels (see below). It can also mean that the parameters of a research question are delimited by the array of methodologies available with which to test it. Further, the extensive choice of methodologies available facilitates analysis of an enormous range of data types (Phillips & Hardy, 2002; Grant et al., 2004).

2 DISCOURSE IN ORGANIZATIONS

Discourses operate at a number of different levels. Five levels in particular—the intrapsychic, the micro, the meso, the macro, and the meta—provide distinct insights into organizing and organization. Further, and in line with the approach to the study of discourse in organizations outlined above, they are deemed intertextual in the sense that the texts within any level of discourse are linked to, and informed by discourses and the texts therein that occur at other levels.

Analyses of discourses at the *intrapsychic* level focus on discourses that occur within the individual's mind or psyche. These discourses are formed through processes of introjection (the unconscious adoption of other people's attitudes and beliefs) and internalization (the making of attitudes and behaviors into part of the individual's nature through learning or unconscious assimilation), which shape and frame the individual's mental maps and models. Studies of various organizing processes drawing on intrapsychic approaches show how discursively constructed meanings rooted in cognitively unconscious scripts, schemas, and frames impact on "sensemaking" (Weick, 1995). Other intrapsychic oriented studies have shown that shifts in mental maps and models among employees can be identified and altered through conversation and can thus lead to organizational change (Jacobs & Heracleous, 2005).

Micro level analyses of discourse in organizations examine the specific utterances and words that are used by individual organizational actors. They tend to be localized in their focus and to concentrate on situated talk through the use of, for example, conversation analytic techniques and ethnomethodology. Analysis of discourses at this level typically involves the examination of discrete episodes of talk in interaction (i.e., interpersonal exchanges) captured, for example, on audiotape recordings or video clips, or can involve the interrogation of specific written passages such as transcripts or documentation. Micro level approaches have been used to generate insights into the conduct of, for example, workplace meetings (Huisman, 2001) or bargaining and negotiation (Hamilton, 1997). In doing so they have focused on phenomena such as turn taking (indicating the dominance of particular individuals), forms of speech that affirm, for example, propositions of value or which create concern, and the use of interruption, hesitation, particular modes of address, different pronouns, and so on.

Meso level discourse analysis represents a departure from the detailed examination of language in use that is associated with micro approaches. The approach focuses on the discursive interactions that impact on the actions and behavior of individuals within, for example, a department or among a specific group of organizational actors who socially interact on a regular basis. It also considers how members' discursive accounts, often narrative-based or highly rhetorical, are synthesized by other members of these groups in order to form common understandings, patterns, and chains of association that condition social order among them (Putnam, 2008).

Macro level discourses can be seen to represent an amalgam of meso level discursive interactions about a particular organization-wide phenomenon. Interactions such as conversations and texts aggregate to form dominant thinking, institutional practices, and collective social perspectives (Ford & Ford, 1995). Such discourses have been the focus of studies concerning, for example, corporate culture (Alvesson & Kärreman, 2000).

Meta level discourses transcend the organization, and instead engage with work and processes of organizing at a societal level, and across institutional domains. Here, the focal point of analysis draws on broader texts that speak to the historical and social context, as well as the power relationships and struggles between actors and institutions. In doing so, meta level discourses may formulate standard thinking and ways of talking about certain types of social phenomena (Alvesson & Kärreman, 2000). Examples of such phenomena include "the market," "sustainability," and "social responsibility."

Research focusing on discourse in organizations may also be summarized using four dimensions: the theoretical versus empirical, the monomodal versus multimodal, the patterned versus non-patterned, and the critical versus pragmatic. These map the “multiple divergences and commonalities” in organizational discourse studies (Grant & Iedema, 2005).

First, whether a researcher adopts a theoretical or empirical orientation will impact on their approach to the study of discourses in organization and the insights that they generate. Proponents of the *theoretical* approach believe that language and discourse constitute the social world and reality, bringing social objects such as “individuals” and “organizations” into being. In adopting this approach, “discourse” is used as an abstract construct (i.e., there is no particular site of enactment or particular actors) to emphasize philosophical aspects of social organization and representation. In contrast, researchers who favor *empirical* approaches regard discourse in organizations as an empirical and analyzable phenomenon. Such approaches draw on a range of transcript or ethnographic data types including conversations, meetings, memos, and other correspondences as evidence for particular discourses in organizations. For example, Boje’s (1995) study uses transcripts of stories told by leaders at Disney in order to highlight the contradictions and complexities of organizational life.

Second, researchers may limit their focus to the study of language in organizations, or they may also analyze other kinds of nonlinguistic devices. The former approach represents a *monomodal* orientation and is concerned with discourse as a linguistic phenomenon, viewing “talk” and writing as the foundation of social organization. Proponents of the monomodal approach study language-related phenomena such as the names, symbols, concepts, and categories used by people to objectify their experiences and thus make sense of the social world (Chia, 2003). Conversely, researchers adopting a *multimodal* orientation are concerned with a variety of nonlinguistic, “meaning-making” devices that show how humans “organize.” In taking this approach, these researchers note that “discourse” not only comprises “systems of communication” (e.g., talk, text, body language, dress, and other observable behaviors), but also “grammars” of social order (e.g., rites, rituals, ceremonies, and practices). Iedema (2007) advances this viewpoint by suggesting that artifacts and symbols such as embodiment (the visible form of an idea), visualization (the formation of a mental image of something), architecture (the complex design and structure of things), and technology (the practical application of scientific knowledge) are meaningful manifestations of human “principles and intentionalities.” A notable stream of empirical multimodal research about discourse in organizations is “actor-network theory.” This theory asserts that both human and nonhuman phenomena potentially contribute to the formation of social and organizational life. Latour (1990), for example, argues that people and artifacts form relationships—“complete chains”—through which competencies and actions are distributed. To illustrate, we may use the example of motor vehicle manufacturing, which involves both human (e.g., designers, engineers, and assembly workers) and nonhuman actors (e.g., computers, software, and machines). In this example, human actors may interact with software and computer data in order to refine the designs for a new passenger motor vehicle, after which machines, which are assigned functions by human programmers, will co-assemble (with human actors) a prototype for further testing and development.

Third, researchers may seek to reveal patterns about discourse in organizational settings, or alternatively emphasize the absence of patterns. Studies adopting a *patterned* approach are often informed by the disciplinary and methodological practices of sociolinguistics and related fields, and draw attention to the ways in which discourse establishes patterned and predictable conduct. Moreover, and as Grant and Iedema (2005) have observed, such studies often examine discourse at three of the levels that have previously been identified: the micro, meso, and macro. These levels in turn correspond to the three main units of

analysis in organizational theory: the individual, the group, and the organization. For example, research into micro level discourses may highlight the values, attitudes, and beliefs of an organizational stakeholder, while studies of discourse at the meso level provide insights into the nature of group interactions such as meetings, negotiations, conflict, and team dynamics. Studies of discourse at the macro level might provide insight into organization-wide phenomena such as organizational culture change. More recently, the study of discourse in organizations has been influenced by postmodernism, which observes the organization as a melting pot of contradictory and ever-changing processes and practices. For example, postmodern perspectives have been used to explore the increasingly complex and unpredictable nature of “the market” and globalization forces. This introduces us to research that adopts a *non-patterned* approach. Non-patterned approaches to discourse in organizations privilege irregular, unusual, and singular accounts of organizational life. Proponents of this view argue that pattern-based studies of discourse are “monological” because they disregard a range of marginalized ideas and opinions in favor of analytical regularity and dominant discourses. Non-patterned approaches thus take a “dialogical” viewpoint, which appreciates the multiple independent voices and discourses that constitute organizational reality. Examples of non-patterned discourses include emotion, conflict, anti-managerial attitudes, jokes, nicknames, and graffiti (Gabriel, 1995; Grant & Iedema, 2005). These discourses often give voice to narratives and stories that run counter to dominant organizational meanings. As such, they occasion thought about what organizations are and what they do, and also what it means to be an organizational member. By illuminating and learning from new and marginalized kinds of meaning, it is argued that the organization emerges as a space for innovation and change, as members explore new meanings, new relationships, and new identities.

A fourth dimension of discourse in organizations is the extent to which such research critiques dominance and power structures in organizations. At one end of the continuum lie *pragmatic* commentators, who use discourse analysis with a view to changing and improving organizational practices. For example, pragmatic research calls attention to ways of improving teamwork and team effectiveness, the more effective management of change, and enhancing organizational performance (e.g., Shaw, 2002; Marshak & Grant, 2008). In contrast, *critical* commentators view organizations as political sites where actors contest meanings to serve their agendas and interests (Mumby, 2004). While the critical perspective broadly seeks to challenge established relationships of power, the aims of this research are varied. Some commentators seek to use critical discourse analysis to give voice to disenfranchised organizational actors, while others aim to unsettle dominant power structures and, consequently, “emancipate” these marginalized actors. Research from the critical perspective draws on various methods and approaches. Among these are stories and “ante-narratives” (Boje, 1995), which, as several commentators note, have gained purchase because they help organizational members who feel different to those around them to build a collective sense of identity. In this way, stories and antenarratives can be used as devices to subvert dominant power structures and ways of thinking in organizations.

As we have shown, studies of discourse in organizations draw on a variety of competing research objectives, approaches, and agendas. These perspectives, in turn, have encouraged debate about the challenges and directions of the field as it continues to grow. One key area of debate concerns claims by critical realist commentators such as Reed (2004) that studies of discourse in organizations overstate its constructivist properties such that language or discourse come to be seen as constituting material reality. For critical realists the material world, as well as the social processes and structures it generates, are ontologically prior to meanings that are contained in discursive interactions. In response to this criticism some discourse analytic researchers such as Fairclough (2005) have promoted an intermediate position. While highlighting the role and significance of discourse in effecting processes

of organizing and organization, this approach, in line with critical realism, takes into account the importance of the material effects and consequences of structures and institutions in shaping what we take to be reality.

A second debate concerns the reticence of researchers to show how discourse might be utilized as an instrument to effect change in organizations rather than simply studying it in order to make sense of change. Here, Marshak and Grant (2008) make four observations about the field of study's orientation to change. These authors note that discourses condition how we approach change, that discourses set the context for change, that discourses and change are influenced by power dynamics, and that discourses are a means to create change. On this final point, Marshak and Grant seek to demonstrate the value of discourse-based change interventions to organizational practitioners as well as researchers, suggesting that participation in discursive activities such as conversation, dialogue, and narrative give rise to new shared meanings and changed mindsets that promote organizational change and development. In taking this perspective, they can be seen to be adopting a position akin to the pragmatic orientation described above.

The study of discourse in organizations encompasses an array of multidisciplinary influences and methodological approaches and this has enabled researchers to engage with and interpret a variety of organization-related issues in ways that would not have been otherwise achievable. Notwithstanding these contributions, there are four main concerns for the field as it continues to develop. First, there is considerable scope for organizational research at the intrapsychic level of discourse analysis. Perspectives in the literature thus far highlight the existence of cognitive unconscious processes that influence individual thoughts, actions, and behaviors. However, the influence of metaphors, mental maps, schemas, and the like upon the formulation of organizational narratives, texts, and conversations and the effect of these in turn on organization and organizing have been underexplored (Marshak, Keenoy, Oswick, & Grant, 2000). Second, more work must be done on the intertextuality and recursivity of discourse in organizational settings. This requires further consideration of the social and historical contexts in which discourses emerge (Keenoy & Oswick, 2004) and further studies which show how the relationships between different levels of discourse and the texts therein, are ongoing and two-way, and the implications of this (Robichaud, Giroux, & Taylor, 2004; Sillince, 2007). Third, those carrying out studies of discourse in organizations need to create and apply methods, frameworks, and models that can cope with the increasingly complex and diverse communicative processes to be found in contemporary organizations. At the center of this is the intensification of communicative practices or "immaterial labor" (Iedema, Rhodes, & Scheeres, 2005). The contemporary workplace requires people to form interpersonal and affective relationships not only by talking to each other face to face and in close physical proximity, but also by using more frequent, faster, and more diverse kinds of communication. These are mediated by new information and communication-related technologies such as e-mail, Weblogging, tele- and video-conferencing, text messaging, and social media such as Facebook, Twitter, and LinkedIn. It is essential that researchers focusing on discourse in organizations are able to account for these developments and explain their significance for contemporary forms of organizing and organization. Finally, it is argued that researchers focusing on discourse in organizations must be more open to engaging with other disciplines of inquiry. For example, Grant and colleagues identify an opportunity "to explore how discourse analysis relates to other theories that are familiar to organizational scholars, such as institutional theory, sensemaking, and actor-network theory" (Grant et al., 2004, p. 26).

Discourse Markers

KERSTIN FISCHER

Discourse markers, comprising items like *yes, well, but, uh, oh*, and *uh-huh* (see, for instance, Schiffrin, 1987), are notoriously difficult to define, and the functional spectrum suggested for these items is huge, including functions as diverse as marking discourse boundaries, managing the turn-taking system, signaling speaker attitude, connecting text segments, and managing repair. Corresponding to their functional variability, many different terms for (subgroups of) discourse markers have been proposed, for instance, pragmatic markers, discourse particles, discourse connectives, feedback signals, backchannel tokens, interjections, text-relation markers, and so forth. Thus, one of the most prominent problems in the study of discourse markers is their definition and delimitation (see Hentschel & Weydt, 1989; Schourup, 1999; Fischer, 2006).

Discourse markers are generally taken not to have any truth-functional or propositional meanings, their meanings and functions rather being located on some pragmatic level, but even that may be a matter of degree. Especially those discourse markers that have connective functions may be rather close to the propositional content of the utterances they connect (e.g., Fraser, 1999). Examples from Fraser (2006, pp. 190–1) are

- (1) *Sue isn't here, although she said she would be.*
- (2) *Donna left late. However, she arrived on time.*
- (3) *Fred a gentleman? On the contrary, he is a boor.*

In these examples, the discourse markers introduce a relationship of contrast between two states or events. The meanings of other discourse markers may, however, rather concern discursive or interactional functions, for example,

- (4) Heritage (1984, p. 303, ex. 9)
R: I fergot t'tell y' the two best things that happen' tuh me t'day.
C: *Oh* super.=What were they.
- (5) Louwerse and Mitchell (2003, p. 200)
Kathy: three times ex, minus four.
Nathan: three times e=x, minus four?
Kathy: *right*.
Nathan: *alright*, distribute first, *right*?
Kathy: *mlm*.

In these examples, we find the interjection *oh* and the feedback signals *right*, *alright*, and *mlm*, where *right* is used in two different positions and in two different functions; in addition to its back-channeling function, *alright* is used as a framing signal beginning a new topic. Discourse markers thus cover a broad functional spectrum. There are now hundreds of studies of various discourse markers in all kinds of contexts in numerous languages of the world that document the peculiar functions and uses of discourse markers in various situations. Given this huge spectrum of studies, we still know remarkably little

2 DISCOURSE MARKERS

about how discourse markers come to fulfill their functions and how this class of items, if it constitutes a single class, can be characterized (Fischer, 2006).

The situation is complicated by the fact that individual discourse markers usually exhibit functional polysemy, that is, the same discourse marker may fulfill several different functions characteristic of the word class. An example is *right* in its two uses in example (5) above. The challenge is thus, in addition to in-depth analyses of individual items in certain contexts, to account for the whole functional spectrum both of individual discourse markers and of the whole class, and to find the principles by means of which the field is structured and individual interpretations assigned.

On the functional level, there are different approaches to structuring the field and to accounting for the polysemy of individual discourse marker items. One of them is the minimalist approach, which aims at identifying those meaning components that are present in all instances of a particular discourse marker or in one of its subclasses. Minimalist approaches rely on finding the one meaning component shared by all uses of an item or of all items in a class in the hope to determine the most characteristic traits of this item or class. At the other end of the spectrum is the maximalist position which aims at working out the subtle interactive functions the items under consideration may have in different sequential contexts; conversation analysis, for instance, which is interested in identifying the discursive practices participants employ themselves in talk-in-interaction, takes such a position (see, for instance, Heritage, 1984, 1998, 2002). Most current approaches, however, use concepts that lie in between the two extremes (Fischer, 2006); either they make use of polysemy relationships which have been shown to be general relationships, or they combine a monosemy approach with other resources that account for the specific uses of a discourse marker (Fischer, 2006).

Approaches that rely on polysemy relations often base their investigations on data from language change, which makes a network of interrelated meanings of an item particularly plausible (see Mosegaard Hansen, 2006). The relationships they employ in their models have generally been shown to be at work for a broad spectrum of linguistic phenomena (see Sweetser, 1990) and which therefore can be assumed to have some cognitive validity. In contrast, approaches that rely on invariant meaning components tend to use synchronic data but make use of additional information that helps to account for the possible interpretations of an item in a particular context. In order to account for the functional spectrum of discourse markers, some of these approaches involve a model of discourse itself (see, most prominently, Schiffrin, 1987). For an overview of current approaches to the functional spectrum of discourse markers see Fischer (2006).

In addition to the functional considerations, several different formal features for the identification of discourse markers have been proposed. Discourse markers may, for instance, come in very different sizes; while some are short and monosyllabic, others may be rather large formulas, serving, however, very similar functions. Different languages seem to have different tendencies towards the one or other type, and some languages also make use of the whole spectrum, as for instance, French (Mosegaard Hansen, 1998; Nemo, 2006). However, of the formal features, syntactic position is the one that has been found useful for systematizing and disambiguating discourse markers the most.

A central feature for the classification of discourse markers, either explicit or implicit, is therefore the kind of position in which an item occurs. To some degree, this criterion can be used to distinguish between different classes of particles. For instance, hedges (see Kaltenböck, Mihatsch, & Schneider, 2010) can be distinguished from discourse markers with a "bracketing function" (Schiffrin, 1987) on the basis of their syntactic position. Likewise, German discourse markers and modal particles can be distinguished on the basis of their integratedness in the syntactic structure of their host utterances (Fischer, 2007);

while discourse markers generally occur outside of the syntactic boundaries of a clause, modal particles are integrated into the sentence structure (Diewald, 2006). In some languages, discourse markers are even restricted to certain syntactic slots, like the sentence-final particles in “Singlish” (Singapore colloquial English, see Gupta, 2006; Ler, 2006).

The position a discourse marker occurs in, often paired with a particular prosodic realization (see Välimaa-Blum, 2005), can also help to disambiguate its possible interpretations. Many of the functions discourse markers fulfill are directly connected to certain syntactic positions. An obvious example is the turn-taking function, which depends on the fact that a marker occurs utterance initially. Often, this criterion is made use of implicitly when particular approaches only consider markers with particular functions, such as the connecting function. Some markers, however, may occur in different positions, and in some cases, these positions may contribute to disambiguating polysemous items. In addition, systematic relationships between a syntactic slot and a particular interpretation have been identified. For instance, the positions of German discourse and modal particles can be associated with particular functions; there may be a functional overlap such that discourse and modal particles may fulfill similar functions; however, if so, they fulfill the same function in different ways (Fischer, 2007). If it is the case that syntactic positions are associated with particular functional interpretations, the position may impose certain meaning components on whichever item occurs in the respective syntactic position. Thus, the interpretation discourse markers may have been in part due to the syntactic position in which they occur, giving rise to a sign-based or constructional account (Fischer, 2010).

Syntactic position is also relevant in grammaticalization processes (Diewald, 2008). Diewald shows for German modal particles that they develop in certain positions, so-called critical contexts, that is, in positions that allow unusual interpretations. Initially, their modal particle interpretations may be restricted to these positions, especially certain sentence types. The more an item becomes grammaticalized as a modal particle, however, the more flexibly it is used in different syntactic positions. Auer (1996) furthermore suggests that the utterance initial position in which many discourse markers occur, the syntactic pre-front field, is associated with a framing function (1996, p. 310) and serves as a grammaticalization position, leading clauses and other linguistic material in this position to become routinized and idiomatic and eventually to become discourse markers (1996, p. 313).

Crosslinguistically there are problems using positional information in the definition of discourse markers since different functions may be encoded by similar positions, and different positions may be associated with similar functions across languages. Thus, which function a position is connected with is language specific; one example is the utterance external, final position of Singlish discourse particles, which arose from language contact. These items have similar functions as the German utterance medial modal particles. For instance, Ler (2006, p. 161) suggests that “*lah* is used when the speaker intends to draw on the shared assumptions behind the utterance.” For instance, she sums up previous research by arguing that *lah* may function “as a marker of rapport and solidarity, comparable to the English ‘filler’ *you know*,

- (6) Don’t be shy lah. [We are friends].” (Ler, 2006, p. 155)

That is, the utterance-final discourse particle *lah* in this example is taken to indicate that there is a proposition in the shared context that speaker and hearer are friends, on the basis of which the current utterance needs to be interpreted. This is exactly the function Diewald (i.e., 2006, 2008) suggests for utterance medial, syntactically fully integrated German modal particles:

The function an MP [modal particle] fulfills is indexical insofar as it points back from the linguistic unit in which the MP appears and relates the utterance to a proposition or speech-act alternative which the speaker regards as relevant and given. (Diewald, 2006, p. 407)

Thus, even though a particular function may be related to a particular syntactic position in one language, the same function may be expressed in another position in another language.

In addition, the Singlish examples presented in Ler (2006, p. 159) show that speakers themselves use discourse markers (which are part of the host language English) and discourse particles (which entered the variety through language contact) interchangeably

- (7) A: So you know we are not spared *lah*. Okay we are not spared *lah*.
- (8) B: Uhm nice to know that I am not alone in all this.
- (9) A: You are not spared *okay*. (ICE-SIN-SIB-077)

To conclude, what one language uses discourse markers for may be realized very differently in another language (see also Fillmore, 1984; Aijmer, 1997). It needs to be considered that similar functions may be related to other syntactic positions in other languages before conclusions can be drawn as to the functional role of such positions. Nevertheless, studies that take syntactic positions into account systematically allow a comparison of the relationship between function and position and thus take us a step forward in our attempts to understand the formal and functional spectrum of discourse markers. Although constructions, that is, form-meaning pairs, such as associations between syntactic position and a particular functional interpretation, cannot be directly compared across languages (Croft, 2001), they could nevertheless provide a good starting point for investigations into the role of particular positions with respect to utterances in general, and thus lead to a better understanding of notions like integratedness, the pre-front field, or the bracketing position, which have been found to be defining in the systematization of the field (see Schiffrin, 1987; Schourup, 1999; Fischer, 2006).

To sum up, the definition and delimitation of discourse markers and their subclasses constitutes an open issue; while we have accumulated a considerable body of knowledge on individual markers and their functions, future work will have to consider the functional spectrum of these items and how it is organized, as well as explain the relationships between these functions. Furthermore, future work needs to attend to those factors determining the different interpretations and disambiguating a given discourse marker occurrence for the respective hearer. Attempts at understanding the formal and functional variability of discourse markers and the spectrum of formal and functional features involved may proceed on the functional level, identifying relationships between readings and involving models of discourse, or relate discourse marker interpretations to those factors determining their interpretations, one of which may be the contribution of the positions in which discourse markers occur.

Discourse Versus discourse

JAMES PAUL GEE

Discourse analysis is the study of language in use (Fairclough, 1992; Gee, 1999). When we use language to communicate we must signal to our listeners *who* we are (in the sense of what socially meaningful identity or role we are speaking out of) and *what* we are doing (what action or activity we are attempting to carry out). People talk and act not just as individuals, but as members of various sorts of social and cultural groups associated with different identities. For example, if a policeman says “You should move your car” we need to know if he is speaking in his role as a policeman and ordering us to move the car, or speaking as a helpful fellow citizen giving us advice.

We determine who is speaking to us—in terms of a social identity or role—and what the speaker is trying to accomplish not just from the words uttered but also from the context in which they were uttered. Context is composed of not just what has been said, but all that is physically present and whatever shared knowledge, beliefs, and culture speakers and listeners assume can be taken for granted. Further, language and context are reflexively related to each other: what we say encourages listeners to interpret the context in certain ways, but what we take the context to be guides us in how we interpret the meaning of what has been said (Duranti, 1997).

We do not invent our language, we inherit it from others. We understand each other because we share conventions about how to use and interpret language. We can most certainly innovate within these conventions—create new words, give new meanings to old words, find new ways of saying things—but these innovations must be shared with others. The social groups in which we share conventions about how to use and interpret language are many and varied. These groups include cultures; ethnic groups; professions like doctors, lawyers, teachers, and carpenters; academic disciplines; interest-driven groups like bird-watchers and video-gamers; and organizations like street gangs, the military, and sports teams. There are yet many other sorts of social groups. Each of them has distinctive ways with words associated with distinctive identities and activities.

There is no one word for all these sorts of groups within which we humans act out distinctive identities and activities. People have tried various names for them: cultures (broadening the term), communities of practice (Lave & Wenger, 1991), speech communities (Labov, 1972a, 1972b), discourse communities (Bizzell, 1992), activity systems (Engeström, Miettinen, & Punamäki, 1999), actor-actant networks (Latour, 2005), collectives (Latour, 2004), thought collectives (Fleck, 1979), and others, such as professions and institutions. Each label is meant to capture only some such groups, or only some aspects of such groups’ practices.

Gee (1990; see also Gee, 1989, 1999) introduced the term “Discourse” with a capital “D” (so-called “big ‘D’ Discourses”) for any such group and the ways in which such socially based group conventions allow people to enact specific identities and activities. He used this term because such groups continue through time—for the most part, they were here before we arrived on earth and will be here after we leave—and we can see them as communicating (“discoursing”) with each other through time and history, using us as their temporary mouthpieces. Gee used the term “discourse” (with a little “d”) for any stretch of language in use. The following discussion is based on Gee (1990, 1999, and their subsequent editions).

2 DISCOURSE VERSUS DISCOURSE

Gee (1990, 1999) introduced the term “social language” for distinctive styles or varieties of language with which people enact specific socially recognizable identities and actions or activities. Social languages allow people to speak as certain types of African Americans, doctors, soldiers, gamblers, mathematicians, gang members, bird-watchers, politicians, or any of a great many other groups. However, when we enact an identity in the world, we do not just use language all by itself to do this. We use language, but we also use distinctive ways of acting, interacting with others, believing, valuing, dressing, and using various sorts of objects and tools in various sorts of distinctive environments.

If you want to show you are a basketball player you cannot just “talk the talk,” you have to “walk the walk” and do that with a basketball on a basketball court in front of other people. If you want to get recognized as a devout Catholic, you cannot just talk the “right” way about the “right” things, you also have to engage in certain actions (like going to Mass) with the “right” people (e.g., priests) in the “right” places (e.g., church) and you have to display the “right” sorts of beliefs (e.g., about the virgin birth of Christ from his mother Mary) and values (e.g., deference to the Pope). The same is true of trying to get recognized as a “Native American,” a “good student,” a “tough policeman,” or a “competent doctor.” You need to talk the talk and walk the walk.

A Discourse with a capital “D” is composed of distinctive ways of speaking and listening and often, too, distinctive ways of writing and reading. These distinctive ways of speaking and listening, and reading and writing, or both, are coupled with distinctive ways of acting, interacting, valuing, feeling, dressing, thinking, and believing. In turn, all of these are coupled with ways of coordinating oneself with (“getting in sync with”) other people, and with various objects, tools, and technologies. All this is in the service of enacting specific socially recognizable identities. These identities might be things like being a Los Angeles Latino street-gang member, a Los Angeles policeman, a field biologist, a first-grade student in a specific classroom and school, a “SPED” student, a certain type of doctor, lawyer, teacher, African American, worker in a “quality control” workplace, man, woman, boyfriend, girlfriend, regular at the local bar, and so on through a virtually endless list.

Discourses are about being “kinds of people” (Hacking, 1986). There are different ways to be an African American or Latino. Thus, there are different kinds of African Americans or members of any other cultural group. To be a policeman is to act out being a particular kind of person. So is being a “tough cop,” which is talking and acting as “sub-kind” of person within the “kind” of being a policeman. Being a SPED (“Special Ed”) student is one way to be a kind of student: it is one kind of student. There are kinds within kinds.

Different kinds of people appear in history, and some disappear. At one time in history, in England and the United States, you could be recognized as a witch, if you “talked the talked” and “walked the walk” (and in some cases you might do so unintentionally). Now it is much harder to be recognized as a witch in many of the places where it was once much easier, though there are still places in the world where you may be recognized as a witch. That “kind” of person has largely disappeared in England and the United States.

The main point of taking about Discourses is to focus on the fact that when people “mean” things to each other, there is always more than language at stake. To mean something to someone else (or even to myself) I have to communicate *who* I am in the sense of what socially situated identity I am taking on here and now (Wieder & Pratt, 1990). I also have to communicate *what* I am doing in terms of what socially situated activity I am seeking to carry out, since Discourses (being particular kinds of people, and doing what they do) exist in part to allow people to carry out certain distinctive activities (e.g., for a policeman, arresting people; for a Catholic, taking communion; for a good student, getting an “A” grade).

Language is not enough for such being and doing. We have to get our minds and actions “right,” as well. We also have to get ourselves appropriately in sync with various objects, tools, places, technologies, and other people. Being in a Discourse means being able to engage in a particular sort of “dance” with other people, words, deeds, values, feelings, objects, tools, technologies, places, and times so as to be recognized as a distinctive sort of *who* doing a distinctive sort of *what*. Being able to understand a Discourse means being able to recognize and participate in such “dances.”

Discourses are not units or tight boxes with neat boundaries. Rather they are *ways of recognizing and getting recognized* as certain sorts of *whos* doing certain sorts of *whats*. One and the same “dance” may be recognized in multiple ways: in partial ways, in contradictory ways, in disputed ways, in negotiable ways, and so forth through all the multiplicities and problematics postmodernism has made so popular. Discourses, then, are matters of enactment and recognition.

All recognition processes have to satisfy a variety of constraints in probabilistic and sometimes partial ways. For example, something recognized as a “weapon” (e.g., a baseball bat or a fireplace poker) may share some features with prototypical weapons (e.g., a gun, sword, or club) and not share other features. And there may be disagreement about the matter. Furthermore, the very same object might be recognized as a weapon in one context and not in another. So, too, with being in and out of Discourses, for example, enacting and recognizing being-doing a certain type of street gang member, Special Ed student, or particle physicist.

While there is an endless array of Discourses in the world, nearly all human beings, except under extraordinary conditions, acquire early in life an initial Discourse within whatever constitutes their primary socializing unit. Early in life, we all learn a culturally distinctive way of being an “everyday person” as a member of our family and community. We can call this our “primary Discourse.” Our primary Discourse gives us our initial and often enduring sense of self and sets the foundations of our culturally specific vernacular language (our “everyday language”), the language in which we speak and act as “everyday” (non-specialized) people.

As a person grows up, lots of interesting things can happen to his or her primary Discourse. Primary Discourses can change, hybridize with other Discourses, and they may even die. In any case, for the vast majority of us, our primary Discourse, through all its transformations, serves us throughout life as what I will call our “lifeworld Discourse” (Habermas, 1984). Our lifeworld Discourse is the way that we use language, feel and think, act and interact, and so forth, in order to be an “everyday” (non-specialized) person. In our pluralistic world there is much adjustment and negotiation as people seek to meet in the terrain of the “lifeworld,” given that lifeworlds are culturally distinctive—that is, different groups of people have different ways of being-doing “everyday people.”

All the Discourses we acquire later in life, beyond our primary Discourse, we acquire within a more “public sphere” than our initial socializing group. We can call these “secondary Discourses.” They are acquired within institutions that are part and parcel of wider communities, whether these communities be religious groups, community organizations, schools, businesses, or governments.

As we are being socialized early in life, secondary Discourses very often play an interesting role. Primary Discourses work out, over time, alignments and allegiances with and against other Discourses, alignments and allegiances that shape them as they, in turn, shape these other Discourses.

One way that many social groups achieve an alignment with secondary Discourses they value is by incorporating certain aspects of the practices of these secondary Discourses into the early (primary Discourse) socialization of their children. For example, some African

American families incorporate aspects of the practices and values of African American churches into their primary Discourse, just as my family incorporated aspects of the practices and values of a very traditional Catholicism into our primary Discourse. This is an extremely important mechanism in terms of which bits and pieces of a valued “community” identity or “public” identity (to be more fully practiced later in the child’s life) are incorporated into the child’s “private,” “home-based,” “lifeworld” identity.

Social groups that are deeply affiliated with formal schooling often incorporate into the socialization of their children practices that resonate with later school-based secondary Discourses. For example, their children are encouraged (and coached) from an early age at dinner time to tell in quite expository ways stories that are rather like little essays; and parents interact with their children over books in ways that encourage a great deal of labeling and the answering of a variety of types of questions, as well as the forming of intertextual relationships between books, and between books and the world.

There are, of course, complex relationships between people’s primary Discourses and the secondary ones they are acquiring, as well as among their academic, institutional, and community-based secondary Discourses. For example, when they go to school children acquire a secondary Discourse that involves the identity of being a student of a certain kind and using certain kinds of “school language.” This identity and these forms of language can, at certain points, conflict with the identities, values, and ways with words which some children have learned at home as part of their primary Discourse. For other children there is a much better fit or match.

Here is one example of such a conflict (Scollon & Scollon, 1981). In some Native American groups, people of a subordinate status remain quiet in the presence of elders or those of a higher status who display their knowledge by speaking. School often requires children to display their knowledge by speaking to the teacher so that she can assess it. But the teacher is of higher status, the authority figure, and the child’s home-based Discourse dictates listening, not speaking and displaying, in this sort of context.

Discourses can mix or be ambiguous. For example, an African American running for office might, in a church, be speaking and acting from a mixture of a church Discourse—seeking to get recognized as a Christian of a certain sort—and a political Discourse—seeking to get recognized as a politician of a certain sort. Or there may be ambiguity about which Discourse is in play at which time. When people speak and act they are “bidding” to be recognized as a certain kind of person; the “bid” may not always be successful, or the person may be recognized in different ways than he or she intended.

Discourse: Mixed Methods

JOHN H. PARMELEE AND STEPHYNIE C. PERKINS

There are many fields where discourse can be studied, and there are many methods that can be used to study discourse. One such field is political communication, which includes US presidential campaign communication. Research on presidential campaign discourse tends to focus on the candidates' speeches, debates, and political advertising. However, while there are many studies that have examined the discourse found in presidential campaigns, only a few studies have done so using a mixed methods approach (Parmelee, Perkins, & Sayre, 2007). This article offers an example of how discourse can be studied in a more meaningful way using a mixed methods approach than by using any one method. One political ad—the first that Barack Obama's campaign released during his presidential run—is examined with a quantitative method (manifest content analysis), and a qualitative method (frame analysis), to demonstrate the value of mixed methods for studying campaign discourse.

Background to the Type of Discourse Being Examined

The first political ad Obama ran was not a traditional 30-second spot but rather a six-minute video, titled *Meet Barack*, which was featured prominently on his campaign Web site a year before the first primary began, and through his nomination win. Most presidential candidates during the last 20 years have used these long-form videos, which are known as “meet the candidate” videos (Parmelee, 2003). They combine biographical and issue information to establish an initial impression of the candidate during the pre-primary stage. The visual and verbal information contained in a video's story line is often pre-tested on party leaders and campaign-run focus groups, and revisions are sometimes done after that to make the candidate appear ideal for the presidency (Devlin, 1994; Parmelee, 2003). The videos, which are often the first advertising produced and disseminated by campaigns, are shown at major party functions to attract potential donors and likely voters. Journalists also see the videos, and the story lines contained within them can shape media coverage (Connolly, 1999). The Web now allows an ever-increasing number of people to watch and be influenced by such videos. Obama's Web site, for example, allowed and encouraged viewers to e-mail his candidate video to friends. The video was updated several times during the campaign. A later version of the video can be viewed at <http://www.youtube.com/watch?v=WNaFb58C63o>

Mixed Methods Research Design

A mixed methods approach can provide a recursive understanding of any kind of discourse. What is found using one method can enlighten and add context to what is found in another method. In this article, content analysis shows how Obama was presented as an “ideal candidate,” based on previous research that indicates that there are certain “ideal candidate characteristics” that people expect in a president (Trent, Short-Thompson, Mongeau, Metzler, & Trent, 2005). In addition, frame analysis shows how those characteristics connected to

2 DISCOURSE: MIXED METHODS

a dominant theme, which provides added insight into the power of Obama's presentation. Three research questions were asked:

- RQ1: To what degree does Obama's candidate video display ideal candidate characteristics?
- RQ2: What frames are present in Obama's candidate video?
- RQ3: How do the ideal candidate characteristics that are in Obama's video relate to the frames that are apparent in the video?

Many mixed-methods research designs can answer multi-layered research questions such as these. According to Creswell, Plano Clark, Gutmann, and Hanson (2003), there are six such designs: sequential explanatory, sequential exploratory, sequential transformative, concurrent embedded, concurrent triangulated, and concurrent transformative. Research into the Obama video is an example of a sequential explanatory study. Sequential explanatory studies begin with a quantitative method and later utilize a qualitative method to put the quantitative results into some larger context. First a quantitative method, content analysis, examined which ideal candidate characteristics were evident in Obama's video. After that a qualitative method, frame analysis, helped to explain the importance of the content analysis findings by showing how the ideal candidate characteristics connected to the video's dominant frames to make the characteristics more persuasive.

Content Analysis and the Examination of Thematic Content

There are many aspects of discourse that content analysis can examine. However, it is important to remember that one should look only at manifest content, which is content that can be explicitly seen or heard. As a result the unit of analysis, which is the aspect of content being measured in a study, is often syntactical or thematic content. A content analysis of syntactical content might count the number of times certain words are mentioned in a speech or ad. In terms of Obama's video, thematic content was analyzed: specifically ten themes called "ideal candidate characteristics." Research over several decades indicates that there are ten personal and professional characteristics that people consider ideal for a presidential candidate to possess (Trent et al., 2005). It is important for candidates to verbally and visually display as many of these characteristics as possible, because research shows that candidates who do so can heavily influence how people perceive them (Parmelee, 2008).

Doing a proper content analysis requires that the thematic content under study, in this case the ten characteristics, be clearly defined, or operationally defined, so that the people doing the content analysis, called coders, will know precisely what to look for. The ten ideal candidate characteristics are listed below, along with their "operationalizations," or definitions, which are presented here in parenthesis: talks about the nation's problems (mentions problems facing America); has solutions to problems (mentions solutions that the candidate has been a part of or solutions the candidate is proposing); has moral character (talks about morality); faithful to spouse (shown with spouse as part of a strong family unit); experience in office (mentions the candidate's past legislative accomplishments or general political experience); honesty (mentions honesty, integrity, ethics); forceful public speaker (talks with passion or strength); energetic leader (shows energy, passion, enthusiasm); remains calm and cautious (never shows anger or excitable temperament); military service (mentions candidate's military service). If the operationalizations fail to accurately describe the characteristics being analyzed, the coders might not find characteristics in the video even if they are there, which would be called a "threat to construct validity."

Table 1 Content analysis: absence or presence (visual and/or verbal) in Obama's 2008 candidate video of the "ideal candidate qualities" described in Trent et al., 2005

<i>Ideal candidate qualities</i>	<i>Coder 1</i>	<i>Coder 2</i>
1 Talks about the nation's problems	1	1
2 Has solutions to problems	1	1
3 Has moral character	1	1
4 Faithful to spouse	1	1
5 Experience in office	1	1
6 Honesty	1	1
7 Forceful public speaker	1	1
8 Energetic leader	1	1
9 Remains calm and cautious	1	1
10 Has done military service	0	0

1 = present; 0 = absent.

The ten ideal candidate characteristics, along with the operationalizations, were then put on paper, called a code sheet, so that the coders could mark which of the characteristics were apparent in the video. The coders individually viewed and coded Obama's video and noted the presence or absence of these characteristics, which could be displayed visually or verbally.

To control for the potential differences that race and gender might impose on how political advertising is viewed, one coder was an African American female and the other was a white male. Coders had to agree on what they found, to achieve what is called intercoder reliability, at least 80% of the time. In this study, intercoder reliability was 100%. Intercoder reliability can be calculated with one of several formulas, including one by Holsti (1969). In Holsti's formula, intercoder reliability = $2M/(N1 + N2)$, where M = the number of times the two coders agreed, N1 = the number of coding decisions by the first coder, and N2 = the number of coding decisions by the second coder. In this study, there were ten coding decisions for each coder because there were ten ideal candidate characteristics that they were looking for. After viewing the video, the coders agreed on all 10 characteristics. Table 1 shows the data set for the content analysis, which looked at one video, Obama's. However, the techniques described here could be used to analyze the discourse in a wide range of videos.

Frame Analysis and the Search for the "Central Organizing Idea"

While a manifest content analysis can examine the presence or absence of themes that researchers know in advance they are looking for, this method is not best at discovering and analyzing themes that researchers had not planned to look for. Frame analysis is the best method to reveal themes that emerge from the content being analyzed. All forms of communication, including political ads, tend to arrange information around a frame, which is the "central organizing idea or story line that provides meaning to an unfolding strip of events" (Gamson & Modigliani, 1987, p. 143). Entman (1993) noted that this organizing process, also called the framing process, involves selection and salience: "To frame is to select some aspects of a perceived reality and make them more salient in a communicating text" (p. 52).

In terms of Obama's video, the video's producer organized the verbal and visual appeals around a central theme, or frame, to provide meaning in an efficient package for viewers to absorb and interpret. However, there are an infinite number of frames that the video's producer could have chosen, so examining why certain frames were picked can provide insight into the type of audience being targeted and the video's overall objective.

There are several steps involved in conducting a frame analysis. A transcript must be made of the words and visual elements in the text being analyzed. The text should be viewed numerous times in order for the viewer to become familiar with all of the verbal and visual elements. Entman (1993) argued that frames can be discovered in any text by looking closely for "keywords, stock phrases, stereotyped images, sources of information, and sentences that provide thematically reinforcing clusters of facts or judgments" (p. 52). During the viewing process, it is important to take detailed notes of all the key words and images that apply. In reviewing the notes, close attention is paid to how the words and images are organized around one or two key themes. As a check against the subjectivity of any one researcher, multiple researchers should independently view the text and transcript. Afterward, the researchers compare their notes and locate the commonalities in their findings. The frame analysis of Obama's video followed the process described here, which revealed themes that emerged from the data.

Mixed Methods Results

Several steps were taken to make the quantitative and qualitative results comparable. The first step involved having the content analysis coders discuss with each other what words and images in Obama's video correlated with each ideal candidate characteristic. Once those particular words and images were known, it was possible to compare them to the key words and images that were recorded during the frame analysis. The final step was to find out if the words and images that were used to display ideal candidate characteristics were the same as the words and images that made up the video's dominant frames.

When discussing results from a mixed methods study, one can report each method's findings in a separate section or as part of one section. In the Obama candidate video study, the content analysis and frame analysis findings are discussed together.

In terms of the content analysis, the words and images used in Obama's video displayed nine of the ten ideal candidate characteristics. Military service was the only characteristic not displayed. In displaying these ideal candidate characteristics so fully, Obama was able to match the expectations that surveys during the last 20 years have shown are the most desirable in a presidential contender. The frame analysis revealed a dominant theme that ran throughout the video: unity. Obama was shown as a unifier with regard to politics, class, geography, and race. Furthermore, the words and images used to display most of the ideal characteristics also connected to the unity frame, which framing theory suggests would make the video more persuasive. Examples of the connections between the characteristics and the unity frame are given below.

Seven ideal candidate characteristics that were displayed in the video—talking about the nation's problems, having solutions to problems, honesty, experience in office, being a forceful public speaker, being an energetic leader, and remaining calm and cautious—were connected to the unity frame in terms of political unity. Obama addressed many concerns—gaps in the healthcare system, loose nuclear weapons, the need for tougher ethics laws to keep politicians honest—by talking about how he had built bipartisan coalitions to solve many problems during his years as a legislator in Illinois and in the US Senate. The video notes, "In all these efforts, he's brought Democrats and Republicans together for the common good" (AKP Message & Media, 2007). Emphasizing Obama's

bipartisanship shows his ability to be a political unifier and increases the chances that viewers will see him displaying the ideal characteristic of having solutions to problems. In other words, a legislator who reaches across party lines tends to have more success at passing legislation than one who is not successful at achieving working coalitions.

The ideal characteristics of forceful public speaker, energetic leader, and remaining calm and cautious can be seen whenever Obama is shown speaking, and especially during the opening and closing scenes of Obama's video, which are taken from his keynote speech at the 2004 Democratic National Convention. His speaking style is forceful and energetic, yet he avoids showing anger or the kind of excitable temperament that clashes with the expectation of a calm and cautious leader. As he speaks he moves his arms vigorously, as opposed to keeping them idle at his side. He also points his right finger with force when he wants to add emphasis, but he does not point his finger directly at the crowd or the camera, which might seem intrusive or overly aggressive. The video begins with the convention crowd applauding when he says: "There is not a liberal America and a conservative America, there is the United States of America" (AKP Message & Media, 2007). This speech also connects to the unity frame by emphasizing the unity of the country rather than preeminence of any ideology.

The Value of Mixed Methods

A mixed methods approach is valuable because every method has limitations. Each method is designed to reveal answers to certain types of research questions, but not others. As a result, using only one method would limit the ability of a study to comprehensively answer all the questions posed. In this article, the first research question calls for a quantitative examination because what is being looked for are discrete elements—in this case, ten characteristics—that can be operationally defined before the data gathering begins, and then objectively measured numerically. The second research question requires a qualitative exploration to understand what dominant frames, or themes, are embedded in Obama's discourse. These are themes that might fall outside the preset operational definitions used in a quantitative content analysis. Such definitions demand, as Pauly (1991) put it, "consistency of denotation and absence of connotation. The language of everyday life, however, is lushly metaphorical, wildly contradictory, willfully connotative, and cynically strategic. What can researchers hope to know of human communication if their methods ban the play of meanings?" The third research question can be answered only after integrating the results from the content analysis and frame analysis. In other words, the third research question seeks to determine whether or not the ideal candidate characteristics present in Obama's video are connected to the video's frames. If the characteristics are linked to one or two dominant frames, framing research suggests the video will be more effective with viewers than if the characteristics fail to make this connection. The mixed methods design described in this article can be used to analyze a wide array of discourse, ranging from speeches and news reports to interpersonal communication.

Discourse: Overview

SIGRID NORRIS

"Discourse analysis is widely recognized as one of the most vast, but also as one of the least defined, areas in linguistics (e.g. Stubbs, 1983, p. 12; Tannen, 1989, pp. 6–8)" (Schiffrin, 1994, p. 5). As the quote suggests, discourse analysis encompasses a range of investigations, but many linguists would agree that discourse analysis is primarily concerned with spoken language. Quite often, discourse analysts examine spoken language by taking the utterance as their unit of analysis (Schiffrin, 1994, pp. 40–1). Utterances, or breath-units (Chafe, 1980), can be analyzed from a syntactic or sequential point of view or from a semantic or pragmatic point of view, thereby balancing the formal (investigation of patterns) and the functional (analysis of how utterances are used in context) perspectives. Thus, both form and function are of importance to discourse analysts. Yet, some analysts may be more interested in one and some more in the other. Regardless of the analyst's primary interest, TRANSCRIPTION is of great importance to all discourse analysts, as the transcribed utterances, the transcript, are the data that are later analyzed.

Discourse analysis is sometimes confused with conversation analysis and the entry on DISCOURSE ANALYSIS AND CONVERSATION ANALYSIS clearly shows where and how they differ. Another important distinction is made by Gee (1999) where Discourse (with a big "D"), on the one hand, encompasses the way social actors act and how they speak in a certain area of their life, so that we may speak of the Discourse of student life, the Discourse of homeowners, or the Discourse of dog-walkers. Small "d" discourse, on the other hand, largely overlaps with what discourse analysts generally view as discourse (see DISCOURSE VERSUS DISCOURSE).

In discourse analysis itself, several major directions or approaches to discourse are evident, including CRITICAL DISCOURSE ANALYSIS, DISCOURSE AND COGNITION, INTERCULTURAL DISCOURSE, MEDIATED DISCOURSE ANALYSIS OR DISCOURSE IN ACTION, NARRATIVE DISCOURSE, and RHETORICAL DISCOURSE ANALYSIS. These approaches differ from one another in ways that are described in each entry.

Because discourse is used to accomplish many nonlinguistic goals, discourse analysis has developed around thematic orientations, some of which are included in the encyclopedia. Thematic directions often take one of the above approaches as their framework, but focus on larger thematic areas such as ANTICIPATORY DISCOURSE, CLASSROOM DISCOURSE, MEDICAL DISCOURSE, DISCOURSE AND IDENTITY, DISCOURSE IN ORGANIZATIONS, FAMILY DISCOURSE, IMMIGRANT DISCOURSE, OR NEWS DISCOURSE, or focus on more narrow thematic areas such as DISCOURSE MARKERS OR RHYTHM IN DISCOURSE. In the future, such thematic areas will undoubtedly continue to expand as discourse analysts expand the breadth and depth of their work in other areas.

Discriminant Function Analysis

SARA DA SILVA RAMOS AND SUSAN J. RICKARD LIOW

Discriminant function analysis (DFA) is a data-reduction technique used to make decisions about naturally occurring group membership. It can answer theoretical questions but has proved especially useful in applied research. In this entry we begin with an overview of DFA, describing the two types of DFA investigation and its three main procedures, followed by a summary of DFA's potential and its limitations. We then explain the steps needed for interpreting DFA results, and conclude with two recent examples of the use of DFA as a statistical tool in psycholinguistic research.

Overview

DFA works by extracting a linear combination of variables that maximizes the differences between natural group means, and allows identification of the variables that predict group membership from a set of predictors. The adequacy of this natural group classification is then compared with the membership in the groups of interest—the dependent variable (DV).

Conceptually, DFA may appear similar to regression but the independent variables are usually continuous, the DV is categorical (unlike linear regression) and can predict membership of more than two groups (unlike logistic regression). DFA is also different from both factor analysis and cluster analysis. When using DFA, the researcher is analyzing whether a set of measures (the independent variables) are useful to predict group membership by identifying which variables are the best discriminators between groups, rather than identifying the factors (latent variables) underlying a set of correlated variables, or clusters (groups) of individual cases based on similarities in the set of variables.

Two Types of DFA Investigations

Descriptive investigations: DFA is often used as a follow-up to MANOVA (multivariate analysis of variance, in place of a series of ANOVAs) for interpreting the major differences between groups. These differences might include measurements of participants' abilities on a battery of cognitive or linguistic tests. For example, DFA could be used to investigate the nature of the relationship between different abilities in children thought to be at risk for dyslexia; DFA would help by identifying which test(s) are the most useful for measuring cognitive or linguistic abilities, and which results best discriminate children at risk for dyslexia from typically developing children.

Predictive investigations: DFA can also determine the relative importance of a set of variables, or combination of variables, that reliably predict group membership. For example, DFA could be used as a time-saving means of selecting or allocating applicants for special training or employment, based on the outcome of previous experience with a successful pool of recruits.

Three DFA Procedures

First, standard DFA results, in which all DVs are tested at the same time, are relatively simple and clear, and they offer parsimony in complex data sets. For example, 200 children from four nurseries differ on 10 variables (birth weight, age at first word, age at first step, height, weight, mother's education, father's income, number of siblings, birth order, hours spent sleeping). A health worker wants to know the relative influence of variables on children's literacy skill achievement in school (good, average, or weak). DFA could be used to identify the major differences between the four nurseries. The result might be that only two subjectively labeled dimensions—for example, "socioeconomic group" and "physical development"—are the two discriminant functions that have significant standardized canonical classification coefficients, and they account for 80% and 10% of the variance respectively.

Second, sequential (or hierarchical) DFA is often preferred to standard DFA because it allows the researcher to enter variables according to their ability to discriminate the two (or more) groups in a specific order. In this case, putting parental education and income first would maximize separation, but since these are not very amenable to intervention, the health worker would want to know which aspects of physical development might make a difference.

Third, stepwise DFA is statistically driven, and is only used when there are no a priori practical or theoretical reasons for giving precedence to DVs over others. The disadvantage of using statistical over theoretical or practical criteria is that it can lead to results that rely on trivial differences in relationships among variables (Tabachnik & Fidell, 2001). These will not be helpful for understanding the important differences between groups.

DFA Potential and Limitations

DFA is available in most statistical packages (e.g., SAS, SPSS, Statsoft, SYSTAT) and is easy to use (see Field, 2009). DFA's ability to account simultaneously for differences in combinations of variables between groups over and beyond differences across single multiple variables is perhaps one of the most powerful aspects of this technique. In addition, DFA can provide mathematical equations that enable the prediction of group membership in new cases, and it can assess the accuracy of this prediction. However, there are a number of issues to take into account when using DFA, and caution is needed to ensure reliability of the discriminant functions and their interpretation.

First, the general assumptions for parametric data must be met: Observations must be statistically independent; the data should be interval and randomly sampled; there should be multivariate normality for the DVs; and the assumption of homogeneity of variance-covariance matrices must be met (Box's test). Having equal sample sizes across groups is particularly important when using DFA for accurate prediction of group membership. Setting the probability of a case being assigned to a group based on the sample size (i.e., smaller groups to be less probable than larger groups) is one way of avoiding the problems associated with having unequal sample sizes. In addition, the sample size of the smallest group should exceed the number of predictor variables by more than two (Klecka, 1986). Therefore, in the above example where a health worker wants to predict literacy skill from 10 variables, there should be at least 12 observations (participants) per group. A few outliers in one group can greatly distort the results, so exploring the raw data and descriptive statistics before DFA is especially important. Most of the DFA assumptions can be tested in the same way as for univariate tests, such as regression or ANOVA. When there is a clear violation of the assumptions (especially nonhomogeneity of variance or small, unequal sample sizes) and eliminating outliers or transforming variables does not solve the problem, nonparametric solutions such as logistic regression should be used instead of DFA.

Additionally, most statistical packages are not well suited to deal with within-subjects designs, and so factorial designs are best investigated through MANOVA (but see Tabachnick & Fidell, 2001, for an example of use of DFA with a factorial design).

Steps in Interpreting DFA Results

If the DFA assumptions (see above) have been met, there are still five steps needed to ensure clear interpretation of the results, and to maximize the utility of DFA. The relevant output for these steps is available in most statistical packages, though the format and options for analyses and output of DFA differ across programs. For a detailed comparison between SAS, SPSS, and SYSTAT refer to Tabachnik and Fidell (2001).

Step 1 in interpreting the DFA results is to assess whether group membership can be reliably predicted from the set of DVs. This can be done by examining the significance of the Wilks's lambda and chi-square results associated with each function. Step 2 is to note how many dimensions (or functions) can reliably distinguish the groups within the pool of participants. The number of extracted functions is normally one fewer than the number of predicted groups, but it is not always the case that all functions extracted significantly improve the prediction of group membership.

Step 3 is to check whether the amount of variance is accounted for by the resulting function(s), and whether additional functions can add to the predictive power of the initial function. This is given by the canonical correlation associated with each function that, when squared, indicates the proportion of variance accounted for by the group of DVs in separating the groups according to that function. This type of information can be particularly important when deciding whether or not additional tests would be useful. In the health worker example (see above), further measurements might facilitate treatment planning if DFA can discriminate children with different types of dyslexia for allocation to different intervention programs. Alternatively, a common finding is that a combination of variables, rather than one variable, is essential for predicting group membership. For example, a combination of reading accuracy, reading comprehension, and phonological awareness test results might identify children at risk for dyslexia better than reading accuracy alone.

Step 4, the structure matrix of correlations between each discriminant function and the DVs, is important to an understanding of the meaning of the functions. This shows the correlations between each discriminant function and the DVs, and tells the researcher what variables differentiate the various groups. For example, overall reading accuracy may be strongly correlated with a first function that reliably discriminates children with dyslexia from normally developing children, but difference in performance between regular and irregular words in a spelling test might be useful for discriminating children with reading disabilities who have phonological difficulties from those who do not. In this situation, the second function would load more strongly on the task measuring regular-irregular discrepancies.

Step 5 is optional, but DFA results also provide a set of standardized canonical discriminant function coefficients that can be used for deriving discriminant function scores. The squared canonical correlation for each variate is also an appropriate measure of effect size for this test (Field, 2009). In addition, classification equations based on the classification function coefficients can be developed for each group, and enable the prediction of the most likely outcome in new cases. The resulting equations for each discriminant function, or group classification function, are similar to those obtainable in multiple regression. Individual standardized scores in each DV are multiplied by the respective standardized discriminant function coefficients (or classification function coefficients), and the products for all the predictors are added and compared with the group centroid. The adequacy of

Table 1 Classification accuracy table for the health worker example

<i>Developmental status</i>	<i>Predicted group membership</i>	
	<i>Typical</i>	<i>At risk</i>
Typical	Correct classification	False positive
At risk	False negative	Correct classification

the classification function for predicting group membership can be assessed by verifying the proportion of cases that are correctly classified. The “leave one out” classification is a simple procedure of cross-validation that verifies whether the classification for each case is correct, when data from that case are left out for deriving the classification function. When assessing the adequacy of the classification, it is important to distinguish between false positives and false negatives (see Table 1) and to consider the implications of either kind of misclassification. In the example of the health worker, a high proportion of false negatives could lead to a large number of children not being given intervention because they have been misclassified as typically developing. On the other hand, using a classification function that results in a considerable proportion of false positives will result in wastage of resources for intervention, because children will be identified as at risk when they are in fact developing typically.

Concluding Remarks and Examples

DFA is not a type of statistical analysis frequently used in psycholinguistics, or in applied linguistics more generally. This is probably because most theoreticians are less likely to be concerned with data reduction. They are usually looking for differences across groups on a series of variables, or in predicting variability in a particular trait or ability based on a set of predictors. In these types of designs, the researcher is more interested in investigating the effects of a manipulation on different groups, and other kinds of parametric analysis would be more appropriate (e.g., ANOVA, regression)—techniques that are more widely used and understood. However, DFA has a useful role to play when the researcher wants to investigate variable differences across naturally occurring groups; that is, the researcher decides which measures are relevant to collect for the main pool of participants and then assesses their ability to discriminate groups of interest.

Most of the current psycholinguistic research that has employed DFA has been aimed either at validating assessment tools for classifying or diagnosing individuals in different groups, or at assessing whether a combination of tests enables greater accuracy in classification or diagnosis than individual tests. Recent examples of the use of DFA in clinical practice include an assessment tool for bilinguals (Lim, Rickard Liow, Lincoln, Chan, & Onslow, 2008) and how a combination of subjective and objective data improves the identification of children with language impairment (Bishop & McDonald, 2009). Briefly, Lim et al. (2008) examined whether bilingual (English–Mandarin) participants’ ratings about their language proficiency, frequency of language use, and domain of language used in each of their two languages were significant predictors for determining language dominance, as assessed by the overall responses to a self-report questionnaire. The researchers found that a combination of these variables could correctly classify language dominance well above chance in English-dominant, balanced, and Mandarin-dominant bilinguals. The classification results obtained through DFA were further validated by comparing the results

of each group in English and Mandarin vocabulary tests. Bishop and McDonald (2009) showed how a combination of language test scores and parental reports is a much more accurate way of diagnosing specific language impairment than using either of these methods alone. This example is a clear illustration of the unique potential of DFA compared with other statistical techniques; analyzing either test scores or parental report would yield differences across the normally developing and language-impaired children groups, but the DFA's combination of results from objective instruments and report techniques improves diagnostic accuracy.

DFA is thus particularly useful for studying groups that differ in complex ways across a number of variables. The two examples provided demonstrate the potential of DFA in validating psycholinguistic measures and tasks, as well as in assessing the clinical utility of such measures used alone or in combination.

Distance Language Learning

CYNTHIA WHITE

Distance education offers individuals flexible access to language learning opportunities made possible by a range of technologies including print, audio, video, Web, and interactive conferencing. The evolution of large-scale distance language education from print-based correspondence courses came first with educational radio and broadcast television, then audio and videocassettes, and most recently computers with computer-mediated communication (CMC), interactive multimedia and Web-based video, audio, and multimedia. Ongoing innovation has offset one of the most significant limitations of distance language learning, namely the separation of teachers and learners, and made possible a range of technology-mediated ways to develop interactive competence in the target language. Significant shifts in perspectives and practices have taken place from traditional paradigms focused on independent learning facilitated by self-instructional materials to emerging paradigms focusing on learning as a social process supported largely by information and communication technologies. Distance learning contexts now comprise interconnected communities rather than a series of individual learners, opportunities for spoken online learning events, and authentic encounters with the target language culture and native speakers. The new ways of configuring and accessing distance language learning opportunities, independent of place and/or time, have been adopted by institutions as a means of expanding access to their courses. Changes in the positioning of distance learning opportunities from the margins to the mainstream have largely been due to the advent of CMC, combined with the demand for flexible access to language learning environments; distance language programs have been developed for less commonly taught languages such as Arabic, Chinese, Korean, and Basque, as well as for heritage languages such as Spanish and Italian. It would, however, be a mistake to equate distance learning opportunities with CMC, since a wide range of alternatives for distance learning exist, each with their related practices, including the use of telephone, radio broadcasts, video conferencing and interactive television, and Web 2.0 tools.

Distance language learning can be seen as having evolved through a number of successive waves, or generations (see, e.g., Wang & Sun, 2001), from print-based courses to current models using Internet-based real-time tools for spoken and written interaction and collaboration. The earliest documented forms of distance language learning were developed in Sweden in the 19th century, based around letter writing: Interaction was central to these courses as teachers replied to students' letters drawing out further topics of interest and returning the original correspondence with corrections. Larger scale courses were subsequently developed, using print to carry the educational content to the learners; interaction between teacher and learners was "one-way"—usually by post—with a time lag between mailing and response. A print-based model of correspondence learning was the predominant mode of delivery up to the 1960s: Written teaching dominated, in contrast to spoken teaching (Peters, 1998), and learning by reading was stressed. Few distance language courses were offered at this stage since the context did not support opportunities to develop skills in speaking and listening. This traditional paradigm emphasized independent learning facilitated by self-instructional materials with access to support, feedback, and, in some cases, face-to-face group learning opportunities. The next generation of course models

emerged with broadcast language programs via radio and television, and later with audio- and video-based multiple media language courses. At this stage course development focused on enhancing the quality of students' individual interactions with specially designed printed materials, audio and videotapes, combined with the use of the telephone.

Computer technologies then extended learning opportunities into new realms. Multimedia systems were enhanced by online asynchronous learning environments which included interactive CD-ROMs, Web presentation of materials, and asynchronous CMC in the form of email and discussion lists. Virtual learning environments were adopted by some as merely an alternative medium for the transmission of distance learning materials associated with first and second generation distance language learning. However, it was clear that the new opportunities for communication and interaction changed the relationship between teachers and learners, requiring new roles, new skills, and new forms of expertise among teachers. The distinction between the use of technology for distribution purposes, as opposed to technology used for communication as in email and computer conferencing, became central to understanding exactly what was being offered by distance online language courses (White, 2006). Concerns about student access to learning environments emerged at this stage and a number of courses offered content in both traditional and online options (Reynard, 2003).

Satellite broadcast and interactive television (ITV) have been features of distance education systems in the USA (Oxford, Park-Oh, Ito, & Sumrall, 1993) and Australia (Evans, Stacey, & Tregenza, 2001). This group-based form of distance language education allowed instruction to be delivered to whole classes, and has been especially useful in schools compensating for a lack of local language teachers (Glisan, Dudit, & Howe, 1998). Live one-way satellite transmission has been supplemented by interactive elements including telephone links or fax, and later by email and synchronous CMC. Key issues associated with this paradigm include matching diverse student needs with the content and rate of progression in the broadcasts, the role of the ITV classroom teacher, and the challenge of sustaining student participation and motivation.

Distance language learning has also developed around interactive synchronous learning opportunities with the instructor and other students, as in audiographics, using written and spoken CMC, and oral-visual interaction through Internet-based video conferencing. Starting in the mid-1990s, the use of synchronous audio online, fundamental to audiographic learning environments, was pioneered by researchers at the Open University in the UK. The Lyceum environment—integrating audio, text, and graphics online—significantly extended opportunities for spontaneous interaction and collaborative learning activities supporting the development of interactive oral fluency (Kötter, 2001). The complexity of the multimodal environment, comprising voicebox, whiteboard, a concept map, a document facility, and text chat, was found by some students in the initial stages to be overwhelming, highlighting the importance of adaptive learning and the self-regulation of affect in distance environments. Subsequent enquiry into sociocollaborative task design and tutor training (Hampel, 2006) extended our understanding of what it means to use and foster the use of language online. Spoken online language learning has now emerged as a significant avenue of enquiry in distance language learning with a focus on the affordances and constraints of different online mediums for developing spoken interaction, the contribution of social presence, and the nature of oral competence and intercultural competence online (Lamy, 2004).

Video conferencing was first incorporated into distance language learning in the mid-1990s. A pioneering study carried out by Goodfellow, Jeffreys, Miles, and Shirra (1996) was based on pilot video-conferencing tutorials as part of a distance learning component in a professional English course. While they found evidence for the considerable motivational benefit of video conferencing for participants, there were specific effects on the language

used: delayed transmission disrupted turn-taking, inhibiting conversation and making body language and facial expressions much less useful than anticipated. The importance of explicitly building the connection between activities and practices in video-conferencing sessions and the other components of the language course emerged clearly in the study. Desktop video-conferencing tools have been extensively tested and refined for the teaching of Chinese by distance (Wang 2004) with a sustained focus on such pedagogical issues as task design, the development of communicative competence, and teacher learning.

CMC initially meant using text-based systems for interaction, and the most common forms in distance language learning were first email, then computer conferencing, and real-time chat. Student response to CMC components of distance language courses was initially more complex than expected: Some students were reluctant to participate, or preferred to use CMC for development of receptive competence, for example. The visibility of learners in CMC environments and evidence of lack of involvement, while initially disconcerting, led to new understandings of the importance of social presence online, the need for clear guidelines for students, and the development of teacher expertise in fostering participation online. Murray (2000) argued that CMC was responsible for a shift in the positioning of distance education from the margins to being recognized as a more mainstream form of provision of language learning opportunities. CMC then developed to include oral and written forms which could be used separately or in conjunction. The impact was such that CMC has been described as “the glue of language learning at a distance” (Blake, 2005); while distance language courses include a range of components and independent learning opportunities, they can be brought together, and held together, by regular CMC sessions, hence the glue metaphor. Specifically, CMC engages students, allows them to bring alive the language they study independently, and helps maintain motivation. Bimodal chatting, via sound and text, allows the textual mode to be used as support or backup to what students are doing in the voice channel, without interrupting the speaker. Distance language courses have extended the use of interactive opportunities that text chat offers to prepare students to participate successfully, without teacher intervention, in public chat rooms with native speakers (Tudini, 2005). Here too, the potential benefits of such tools depend on task design, the skills of the teacher, and the way CMC sessions are articulated into the course curriculum.

By the start of the new millennium the reach of distance learning experiences had extended significantly with technology-mediated access to authentic encounters with the target language and culture. While telecollaborative projects offer an authentic and purposeful intercultural experience, such projects are more complex to incorporate into distance language learning given the dispersion of participants. This potential disadvantage is, however, partially offset by the fact that distance students are accustomed to technology-mediated language use. Web 2.0 platforms have enhanced telecollaborative projects, allowing individuals and groups to contribute knowledge, opinions, ideas, and experiences and to form social networks. One example comes from vom Brocke, White, Walker, and vom Brocke (2010) where the two cohorts were distance students of German as a foreign language in New Zealand and English for the social sciences at Münster University, Germany. The configuration of tools provided students with a rich environment for collaboration: Students chose from among a wide range of communication tools, voice, and text, including chat, asynchronous discussion forums and wikis, to plan, exchange ideas, share information, negotiate, collect and analyze data, and provide feedback. In addition students extended these tools to include Facebook, YouTube, and blogs. Over a defined period of time (from two to six weeks depending on the project) students met online synchronously and asynchronously, and collaborated in small groups to complete tasks, activities, and projects that formed part of their course requirements. Including opportunities for students to reflect on features of the interaction and the way the project

developed, as well as to analyze their own contributions and what they learned, introduces an important reflective dimension to such projects, and raises awareness of the interrelated organizational, socioaffective, and sociocognitive elements in collaborative learning online (Mangenot & Nissen, 2006).

Technology has changed our understanding of what it means to teach and learn a language at a distance. Resistance to acknowledging distance language courses as a valid alternative to face-to-face classes has largely been overcome by the advent of CMC and pedagogical innovations that foster the development of collaborative exchanges and interactive competence online. Innovation in distance language learning can be seen as a move from a concern with the development and dissemination of learning materials, as in broadcast education, to a concern with interaction and learning as a social process supported largely by communication technologies. Both high-tech and low-tech distance language programs remain in use around the world: The low-tech infrastructure available to many teachers and students means that advanced technological enhancements are not an option. Descriptions of programs also include radio, telephone, mobile learning, web 2.0, and learning management systems (Wang & Chen, 2009). While new technologies often call for fundamental changes in instructional approaches and practices, technological innovation in distance language learning tends to take place well ahead of pedagogical innovation, though this gap is closing. The search for research and pedagogical paradigms appropriate for emerging forms of distance language learning opportunities will continue as technologies provide ever more sophisticated arenas for language learning.

Dörnyei, Zoltán

JUDIT KORMOS

Zoltán Dörnyei (1960–) has contributed greatly to our understanding of how individual differences affect the outcomes of second and foreign language learning. He is most well known for his work on language-learning motivation, but his research on communication strategies has also advanced the field of psycholinguistics. He is also the author of two very popular books on research methodology: *Questionnaires in Second Language Research: Construction, Administration, and Processing* (Dörnyei, 2010) and *Research Methods in Applied Linguistics: Quantitative, Qualitative and Mixed Methodologies* (Dörnyei, 2007).

Zoltán Dörnyei was born in Hungary in 1960, and he studied English literature and linguistics and art history at Eötvös Loránd University, Budapest. He gained his PhD in psycholinguistics in 1989. Between 1988 and 1998 he taught in Hungary, and since 1998 he has been working in the United Kingdom. He is currently professor of psycholinguistics at the School of English Studies, University of Nottingham.

Dörnyei's first major contribution to the study of second language motivation was his article published in 1994, in which he proposed a new pedagogical model of motivation, which had direct relevance for language teaching in foreign language contexts. Dörnyei's (1994) framework of L2 motivation extended Gardner's (1985) theory of motivation, which was based on language-learning situations in second language settings such as the acquisition of French in Canada. Dörnyei's new framework had three levels: (a) the *language level* (social dimension), which included social, cultural, and pragmatic values and attitudes related to the target language; (b) the *learner level*, which concerned the personal characteristics of the students, such as self-confidence and need for achievement; and (c) the *learning-situation level*, which described aspects of language learning in classroom settings. His framework proposed in 1994 and his consequent work in the 1990s on motivating language learners mainly focused on this last level. He argued that *course-specific motivational components*, which include the syllabus, the teaching materials, the teaching method, and the learning tasks, *teacher-specific motivational components*, which are related to the teacher's behavior, personality, and teaching style, and *group-specific motivational components*, which describe the dynamics of the learner group, are of key importance in classroom language-learning contexts. He elaborated the theory of how language-learning groups function in his book with Ehrman (Ehrman & Dörnyei, 1998) and with Murphey (Dörnyei & Murphey, 2003), and he proposed a comprehensive inventory of motivational strategies in the foreign-language classroom in his book *Motivational Strategies in the Language Classroom* (Dörnyei, 2001).

Dörnyei continued to refine and rework the conceptualization of language-learning motivation in further models. When proposing his process model of motivation, he argued that through investigating the time dimension of L2 motivation one can gain an insight into how motivation is generated and how it fluctuates and develops during the learning process (Dörnyei & Ottó, 1998). He recognized that in the case of L2 learning, which may take several years, there was a need to develop a construct that accounts for changes of motivation and includes a temporal dimension. In 2005, Dörnyei (Csizér & Dörnyei, 2005; Dörnyei, 2005) put forward another new model of motivation, the L2 motivational self system, which consists of three main components: ideal L2 self, ought-to L2 self, and L2

learning experience. The ideal L2 self is one's ideal self-image expressing the wish to become a competent L2 speaker. The ought-to L2 self contains "attributes that one believes one ought to possess (i.e. various duties, obligations, or responsibilities) in order to avoid possible negative outcomes" (Dörnyei, 2005, p. 106). L2 learning experience covers "situation specific motives related to the immediate learning environment and experience" (p. 106). The model of motivational self system is based on Higgins's self-discrepancy theory (1987), in which it is argued that motivation is the result of someone's wish to reduce the discrepancy between one's ideal self (one's image of what one would like to become) and one's actual self (one's actual self-state). Motivation also comes about from the intention to lessen the gap between one's actual self and one's ought-to self (that is, one's perception of what significant others would like one to become). In his most recent book, *The Psychology of Second Language Acquisition* (Dörnyei, 2009), he places this model into the context of dynamic systems theory and argues that motivation is a complex system, which is situated in the learning environment and which closely interacts with learners' emotional and cognitive systems. The book reflects his current interest, which involves exploring the psychological processes underlying second language acquisition from the perspective of dynamic systems theory.

In addition to his theoretical work, he conducted a number of surveys on language-learning motivation in Hungary (for a summary see Dörnyei, Csizér, & Németh, 2006). Based on this experience, he prepared a detailed and user-friendly guide to questionnaire design in applied linguistic research (Dörnyei, 2010). In cooperation with Tseng and Schmitt, he also devised a new survey instrument measuring self-regulation in vocabulary acquisition (Tseng, Dörnyei, & Schmitt, 2006). This questionnaire is based on the reconceptualization of learning strategies as self-regulation capacity, and can serve as an example for the development of future questionnaires assessing self-regulatory ability in other areas of language learning.

Dörnyei has also advanced the field of psycholinguistics through his work on communication strategies. He suggested a new definition, according to which "every potentially intentional attempt to cope with any language related problems of which the speaker is aware during the course of communication" (Dörnyei & Scott, 1997, p. 179) can be considered a communication strategy. He proposed a new taxonomy of communication strategies and described the psycholinguistic processes involved in overcoming second language communication problems (Dörnyei & Kormos, 1998). He also investigated the teachability of communication strategies (Dörnyei, 1995) and argued that communication strategies can help the development of fluency of second language speech and should therefore be taught explicitly.

Zoltán Dörnyei is a versatile researcher in the field of second language acquisition, whose work has contributed novel insights into the psycholinguistic processes and factors in language learning.

Douglas, Dan

VIVIANA CORTES

Dan Douglas has made groundbreaking contributions to the study of language for specific purposes (LSP) and language assessment, including his work on the novel exploration of certain specific registers, like the language of aviation, but most importantly with his work on assessment in LSP. His work on assessment focused on analyzing the development of assessment criteria for LSP and on exploring ways to derive these assessment criteria from the sources used to establish LSP test content and methods, that is, the analyses of specific purpose language use situations.

Academic Background

Douglas started his career in applied linguistics after he completed university studies in history and political science: He holds a BA in History and Political Science from Culver Stockton College in Canton, Missouri, and an MA in Ancient History, from the University of Missouri, Columbia. He obtained his MA in English as a Second Language at the University of Hawaii in Honolulu in 1972 and was immediately admitted to the PhD program in Applied Linguistics at Edinburgh University, in Edinburgh, Scotland, in the United Kingdom. He graduated from Edinburgh University in 1977 and his dissertation project, which was supervised by Alan Davis, was entitled *A Study of Reading Among Secondary School Pupils in a Developing Nation*. His study explored reading ability among secondary students in Botswana.

Academic Appointments

Douglas first became involved in teaching English as a second/foreign language in Botswana as a Peace Corps volunteer, teaching English language and literature at Gaborone Secondary School. While completing his MA at the University of Hawaii in Honolulu, he worked as a graduate teaching assistant in the English Language Institute at the university. While working on his doctoral studies, he held a position as a supervisor for English proficiency testing at Edinburgh University. From 1975 to 1977 he was a research fellow at the University of Khartoum in Sudan, where he worked on a research project that investigated directed study habits. Between 1978 and 1980, Douglas was a visiting lecturer at Hiroshima University in Japan, working for the Department of English Language Education and at the same time teaching graduate and undergraduate courses in ESL methods, testing, and theory. All these years spent abroad provided Douglas with ample knowledge in the teaching of English as a foreign language field and significant exposure to different scenarios for teaching LSP, providing hands-on experience in the areas he would focus much of his scholarship on in the years to come.

Douglas was back in the United States in 1980, where he worked three years as the supervisor for the Michigan English Language Battery Testing Program in the English Language Institute at the University of Michigan in Ann Arbor, investigating assessment topics and developing tests. From 1983 to 1985 he was the director of the English Language

Institute at Wayne State University, in Detroit, Michigan, supervising an intensive English program with about 150 students. After a very brief period as an adjunct assistant professor developing English language evaluations and courses for international teaching assistants at Iowa State University, in Ames, Iowa, Douglas was hired as assistant professor for the English Department at this university, where he completed the rest of his academic career, being tenured and promoted to associate professor in 1990, promoted to full professorship in 1997, and retiring as professor emeritus in 2009. At Iowa State University, Douglas taught undergraduate and graduate classes in English for specific purposes, second language acquisition, academic writing for international students, and language assessment, as well as a wide variety of graduate seminars in testing LSP, and computer-assisted language assessment. He also acted as the coordinator for the TESL/Applied Linguistics program for 17 years. In 1998, Professor Douglas worked as a visiting professor in the Department of English Language Literature at Chukyo University in Nagoya, Japan, where he taught graduate and undergraduate classes in American language and culture, TESL theory, and language testing.

Throughout his academic career, he has been on 14 doctoral dissertation and more than 50 master's thesis committees, many of which covered LSP topics, both as director and member of committees in the English Department and in other departments at Iowa State University such as Architecture, Chemistry, Computer Science, Sociology, and in different programs in the College of Education. He also acted as external examiner in several doctoral dissertations and master's theses for the University of Toronto, the University of Melbourne, and the University of Western Australia.

Publications

Douglas has published an impressive number of influential books in the areas of LSP and language assessment. Among his most important books are his seminal study *Assessing Languages for Specific Purposes* (2000), for which he worked at the Universities of Lancaster and London in the United Kingdom in his sabbatical from Iowa State University, and his latest book, *Understanding Language Testing* (2010). In *Assessing Languages for Specific Purposes*, Douglas makes an invaluable contribution to the teaching of LSP and, particularly, English for specific purposes (ESP), providing ESP practitioners with a solid set of tools for ESP testing through a detailed and comprehensive description of his approach to test construction based on a model for test development previously introduced by Bachman and Palmer (1996). The book presents a thorough description of LSP tests, introduces various tools and procedures for LSP test development and use, and provides its readership with an overview of the dynamic qualities present in this type of assessment instruments.

Douglas considers LSP testing a special form of communicative language and describes it as different from general language testing in two main ways: it reflects specific language use and it calls for significant non linguistic background knowledge. Douglas emphasizes the importance of a thorough analysis of the target language situation and suggests using a variety of methods for this purpose, such as context-based research (Douglas & Selinker, 1994) or grounded ethnography (Frankel & Beckman, 1982). In addition, Douglas also discusses frequent problems in the development and use of LSP tests, such as the possible lack of specialized knowledge in test developers and test raters, suggesting this drawback could be overcome by close collaboration with expert informants throughout the test development and application process.

In his latest book, *Understanding Language Testing*, Douglas presents an introduction to language tests and test development aimed at novice ESL practitioners and beginning students of linguistics or language education looking for a first introduction to language testing. This book assumes no previous knowledge in its readership and uses examples

from a wide variety of languages to promote the understanding language testing procedures. Although the book is based on a strong theoretical rationale, it concentrates on practical assessment issues such as test use and development, test scoring systems, test result and statistics analysis and interpretation, and ethical issues in test design and applications. To these authored books, we must add Douglas's edited volume, *English Language Testing in Colleges and Universities*, published by the National Association of Foreign Student Affairs (NAFSA) in 1990 and 2003.

Douglas's interest in the investigation of language testing and the use of technology in language assessment is highlighted in two books coauthored with Carol Chapelle, his colleague at Iowa State University: *A New Decade of Language Testing Research* (1993), an edited book that presents selected papers from the 1990 Language Testing Research Colloquium, and *Assessing Language through Computer Technology* (2006). In this last book, Chapelle and Douglas present important state-of-the art concepts related to computer-assisted language testing (CALT) in order to help novice designers of computer-based language testing tools.

To this list of books we must add a series of monographs published by Educational Testing Services (ETS) that complete his list of published volumes, among which we need to mention *Testing Speaking Ability in Academic Contexts: Theoretical Considerations* (1997), which reports findings on the testing of Language for Academic Purposes (LAP). In addition, Douglas's numerous articles can be found in top journals in the field such as *Language Testing*, *ICAO Journal*, *English for Specific Purposes*, and *System*, among many others, as well as in many edited books.

Research Interests

Douglas has a variety of research interests among which we must list the use of new technologies in language assessment and the development of assessment tools for specific target language situations. Some of Douglas's most salient work in the area of LSP assessment can be read in articles that report the development and application of tests meant to show the language proficiency of aviation personnel, which can promote safer radiotelephony, work that questioned the validity and impact of the assessment of the language of international civil aviation professionals (Douglas, 2004), and a survey of assessment criteria for LSP (Douglas, 2001), as well as the study of assessment criteria for veterinary students' communication skills and the investigation of three important issues—authenticity, specificity, and inseparability—in testing LSP.

Douglas was very active in grant proposal writing, obtaining more than \$180,000 in funding for his research from private and governmental institutions, such as Educational Testing Service (ETS), Pearson Education, and the Iowa Department of Education. He was also awarded several internal grants at Iowa State University.

Regarding his service to the profession, Douglas was the coeditor for *Language Testing* from 2002 to 2007, a review editor for *TESOL Quarterly* from 1998 to 2001, and he is a current member of the editorial board of *English for Specific Purposes*, the *Journal of English for Academic Purposes*, *ESP Malaysia*, and the *Iran Language Institute Language Teaching Journal*. He served as vice-president and president to the International Language Testing Association (2004–6), and as secretary to the Midwest Association of Language Testers (MwALT) from 2001 to 2006, chairing the seventh annual conference for this association in 2005. He has also been a member of the National Advisory Board for the National Foreign Language Resource and Training Center at Michigan State University, serving two periods, from 1996 to 1999 and from 2006 to 2010. In addition, he worked as a member and consultant for a wide range of professional associations in the LSP field in the United States, Japan, and Hong Kong, among other locations. He has been an active member of the American

Association of Applied Linguistics (AAAL), the British Association of Applied Linguistics (BAAL), Teachers of English to Speakers of Other Languages (TESOL), and the International Language Testing Association (ILTA).

Douglas always emphasized the dissemination of his research through presentations in the most renowned conferences in the applied linguistics area such as the Conference for AAAL and the International TESOL Conference, as well as the Language Testing Research Colloquium in the United States and Canada, and as a guest speaker in numerous conferences and workshops in Korea, Japan, Dubai, Morocco, and the United Kingdom, to mention but a few.

Dudley-Evans, Tony

MAGGIE JO ST JOHN

Tony Dudley-Evans (born Sutton Coldfield, Warwickshire, 1943) is one of the leading figures in the development of English for specific purposes (ESP). He was an influential researcher in genre analysis, coauthor of a number of successful and significant textbooks, an innovator in teaching and research approaches, and editor of an important journal.

His career in English language teaching (ELT) began in the 1960s with the British Council in Libya, where his BA in Arabic (University of London) and Postgraduate Certificate in Education in ELT (University of Wales) came together in his teaching at Tripoli College, a secondary school that was set up in the time of King Idris and claimed to be “the Eton of Libya.” It was in Tripoli that his friendship with John Swales began, one that ultimately led to a longstanding professional collaboration. But initially Tony was teaching John Swales and James Cormick to read and translate Arabic articles in the local newspaper *Al-Ra'id* (Swales, 2009, p. 81). From Libya Tony went to Tabriz in northwest Iran (Iranian Azerbaijan), initially as a lecturer and then as Head of the English Language Unit of the University, returning to the UK in 1975 to spend one year at Lancaster and Morecambe College of Further Education, teaching Venezuelan students, before his appointment at the University of Birmingham where he had a distinguished career until taking early retirement in 2001.

It was in Birmingham that his theoretical and practical contributions to academic literacy came to full fruition. He was Director of the English for Overseas Students Unit (later English for International Students Unit, EISU) for many years and later, in recognition of his contributions to the field, was promoted to Reader in English for Specific Purposes.

He first came to prominence as author and editor, with Martin Bates, of the pioneering *Nucleus* series of English for science and technology textbooks which adopted a notional approach and was “concerned with ways in which the scientist and technologist describes and measures forms and processes” (Bates & Dudley-Evans, 1976–80, Teacher’s Notes, p. vi). At a time when much ELT was based on grammar translation, this series, with a core general science book and specific discipline extensions, was groundbreaking. So too was the involvement of team members in the publication process. The material was initially developed in the University of Tabriz where lecturers in the English Language Unit, mostly on British Council contracts, taught in various science and engineering departments. As a team they developed ESP materials to meet the students’ need to read English language sources in their subject area.

The material focused on certain key notions or scientific concepts, such as properties and shapes, location, structure, measurement, process, and method, which Martin Bates’s research had shown to be fundamental to technical and scientific description. The core textbook introduced these concepts, and then the subject-specific textbooks applied those concepts to texts in areas as diverse as engineering, agriculture, mathematics, medicine, and nursing science. The subject-specific textbooks were published by Longman between 1976 and 1980 in the *Nucleus* series with Martin Bates and Tony acting as editors, and Tony coauthoring the engineering text with Tim Smart and John Wall.

The core text, written by Martin Bates and Tony, and published as *Nucleus: General Science* (1976), was “probably the most commercially successful EAP textbook” (Swales & Feak, 2001, p. 216) to date. Science students at colleges and universities worldwide studied with it, and over a 10-year period it was used in the science streams of all Egyptian secondary schools. There was a specific manual for teachers, and at annual teacher training courses for the teachers and inspectors Tony explained the philosophy and methodology underpinning the materials.

In the story of these materials one sees the concerns and principles which underlie all Tony’s work, that is:

- It is rooted in practical teaching.
- It is imaginative in its exercise typology.
- It is based on collaboration.
- It recognizes the importance of social, institutional, and disciplinary approaches.
- It is grounded in research.
- It is concerned for the involvement and personal development of others.

The partnership with Martin was the first, and one of the most fruitful, of the many professional collaborations that mark Tony’s career.

Another key partnership was with Tim Johns at the University of Birmingham where they instigated innovative interdisciplinary team teaching and materials development (Dudley-Evans & Johns 1980, 1981). They recorded lecturers in highway engineering and plant biology—disciplines with high proportions of postgraduate international students—and then set about developing teaching materials based on these recordings. They would first transcribe them and then produce handouts that both focused on discourse and language issues as diverse as the use of clichés, degrees of certainty, and recognizing the relative importance of information, and ensured that the students had made the necessary links, as expected by the lecturers, between key points in the lecture. The subject and ELT lecturers would then team-teach a session aimed at clarifying the students’ understanding of the lecture as well as highlighting the ways of communicating in the discipline. A consequence of these sessions was both an increased understanding on the part of the students of the expectations of the course and their lecturers, and, on the part of the lecturers, an increased awareness of the difficulties international students might have in understanding linguistic aspects of the lectures and also the wording of examination questions. Tony himself wrote of this work that it “remains the most creative aspect of teaching I have ever been involved with” (personal communication).

This collaboration in team teaching ran in parallel with another on materials writing with John Swales. In the late 1970s Tony and John shared a house for half a year and spent some evenings jointly preparing in-house teaching materials in the area of academic writing for international students at Birmingham and Aston Universities, afterwards comparing notes on how those materials had worked with students before revising them for future groups. Classroom research thus fed directly into the preparation and revision of the teaching materials. Both of them used some aspects of this in later publications, John in *Academic Writing for Graduate Students* (Swales & Feak, 1994), Tony in *Writing Laboratory Reports* (Dudley-Evans, 1985).

Tony was much influenced by the work in genre analysis developed by John Swales in his groundbreaking research on article introductions (Swales, 1981). Tony’s *Writing Laboratory Reports* took a genre-analytical approach to these fundamental documents. Tony researched the product and process of writing undergraduate scientific reports and developed materials at Birmingham to help international students write the reports required of them. He went on to use a similar approach to research different sections, particularly

discussion sections, of academic articles, and from there he explored other genres such as Masters-level dissertations. A joint research-based approach into the English of scientific research papers, a key genre for students in the late 1980s /early 1990s, was instigated by Tony and Tim Johns with all EISU staff in 1991. Tony had succeeded in obtaining samples of articles and letters to the prestigious research journal *Nature* and this was an early example of the corpus-led research for which Birmingham University became so famous (Johns, 2001).

Throughout his academic career Tony wrote and published articles about ESP, focusing on the interface between teaching and teaching materials, and research into the nature of texts. One third of his publications, including his books, are collaborations, with peers such as John and Tim, as well as in the craftsperson–apprentice model (Swales & Feak 2001, p. 215). As Director of EISU Tony was influential in the career development of several “novices,” particularly students he supervised at PhD level and on the MA in Applied English Linguistics. Articles with Helena Zak (Zak & Dudley-Evans, 1986) and Andy Hopkins (Hopkins & Dudley-Evans, 1988) published in the journal *English for Specific Purposes* are examples.

Tony was a respected editor, serving for many years on the editorial board of the journal *English for Specific Purposes* before being invited in the late 1980s to become a coeditor with John Swales and Ann Johns. Over this period *English for Specific Purposes* became established as the key journal in ESP and a major voice in the discipline of applied linguistics. It was particularly noted for its encouragement of non-native speaker (NNS) authors who had not previously published in an international journal; young NNS authors were given specific help in bringing articles up to a standard for publication in an international refereed journal. Tony later coedited the journal with Peter Master and Diane Belcher.

Tony enjoyed collaborating with subject specialists to investigate the rhetoric underlying a particular discipline. A striking example of cross-disciplinary collaboration was his work with Willie Henderson, an economist at Birmingham, on the evolution and structure of economics papers. This work began with a research project investigating the problems in understanding the rhetoric of economics that mature students faced because of the mismatch of economic theory and reality. The research was undertaken by Ann Hewings (research assistant and later a PhD student of Tony’s) under the supervision of Willie Henderson and Tony. Tony and Willie then carried out a historical (diachronic) study of the discourse of article introductions in economics journals. They published their findings in a volume they edited: *The Language of Economics* (Dudley-Evans & Henderson, 1990). This was followed by an interdisciplinary conference, and the collection of papers *Economics and Language* (Henderson, Dudley-Evans, & Backhouse, 1993) emerged from this.

Tony’s ideas on the importance of subject specialist interactions are most fully developed in the book *Developments in ESP: A Multi-Disciplinary Approach* (1998), which he co-authored with Maggie Jo St John. They expounded an approach to ESP which requires deeper insights into disciplinary cultures and their social contexts to understand the discourses and the discourse communities, and a reflection within ESP classroom methodology of the ways of thinking and learning in those disciplines. This summary of major developments and charting of new ideas influencing the discipline is, in keeping with all his work, accessible and wide-ranging, encompassing both theory and practice, and continues to be a key source for students and teachers.

Tony Dudley-Evans is a man of great dedication, integrity, and passion. Alongside his professional career, he has been an enthusiastic supporter of jazz, chairing the organization Birmingham Jazz for many years. Early retirement from his academic career has enabled Tony to apply his professional principles to his love of jazz. He has become a full-time promoter in his home city, Birmingham, and he is also artistic director of the Cheltenham Jazz Festival. He teaches on the BMus and MMus jazz courses at Birmingham Conservatoire,

and his belief in the importance of supporting new talent has led to numerous gigs for local groups, many involving students and graduates. His understanding of social, institutional, and cross-cultural contexts makes him a firm favorite of touring musicians. His in-depth knowledge is based on proactively researching and listening to music of different genres, particularly music that cuts across genres.

He has thus applied the same principles to jazz promotion as are evident in his academic career in English for specific purposes. Interestingly, one of his all-time favorite albums is entitled *ESP*, an album recorded in the 1960s by Miles Davis with his second great quintet featuring Wayne Shorter, Herbie Hancock, Ron Carter, and the wonderful drummer Tony Williams.

Dumas, Bethany K.

RUI SOUSA-SILVA

Bethany K. Dumas (1937–) is a prominent figure in current applied linguistics and, in particular, in forensic linguistics. Her long career and her wide-ranging research interests range from literature, qualitative and quantitative research methodology and discourse analysis to rhetoric, legal discourse, and language and the law. She has published widely on language variation, discourse analysis, and forensic linguistics/language in the judicial process, with a focus on jury instructions and product warnings.

Dumas began her training in language and linguistics. She received her BA in English from the Lamar University (Beaumont, Texas) in May 1959, followed by an MA in English from the University of Arkansas (Fayetteville) in May 1961. She received her PhD in English/linguistics from the University of Arkansas in May 1971 with her dissertation *A Study of the Dialect of Newton County, Arkansas*. She proceeded with her postdoctoral studies at the School of Oriental and African Studies (SOAS), University of London (UK) in 1970–1, where she studied Swahili. She also participated in the Linguistic Society of America Summer Institutes on variation (University of Hawai'i, 1977), computational linguistics (City University of New York Graduate Center, 1986), and syntax and computational linguistics (Stanford University, 1987). However, in the meantime Dumas had already acknowledged the relevance of legal studies to linguistics and developed a concern with the interaction between language and the law, which she consolidated when she received her degree of *Juris Doctor* from The University of Tennessee College of Law in May 1985. This allowed Dumas to combine her solid training in linguistics with training in law.

Dumas started her extensive academic career in 1959 as teaching assistant of English in the United States, at the University of Arkansas. Since then she has worked as instructor (Southwest Missouri State University, Springfield), instructor/assistant professor (Southern University, Baton Rouge, Louisiana), assistant professor/visiting associate professor (Trinity University, San Antonio, Texas), associate professor (The University of Tennessee, Knoxville), adjunct professor (University of Tennessee College of Law, Knoxville), and professorial lecturer (Georgetown University, Washington, DC). She is currently professor of English at The University of Tennessee (Knoxville). The renown of her work, both at home and abroad, led her to work as a visiting professor of linguistics at the University of Utah (Salt Lake City) in the summer of 2004 and as a lecturer at the Institut Universitari de Lingüística Aplicada of the Universitat Pompeu Fabra (Barcelona, Spain) in May 2005.

Dumas is a member of several national and international professional organizations, boards, and commissions, both in linguistics and in law, including the International Association of Forensic Linguistics (IAFL). She acted as editorial board member of the journal *Forensic Linguistics: The International Journal of Language and the Law* from 1994 to 2003 (of which she is a reviewer), and is the editor of the journal *Language and the Judicial Process (LJP)*.

As a renowned academic and researcher, Dumas has participated in several legal language workshops with police forces, attorneys and judiciary interpreters, and translators. She has made significant contributions on topics spanning from expert witnessing in trial demonstrations to legal translation and interpreting, interrogation techniques and victim assistance, problems and linguistic analysis of jury instructions, and custodial interrogation.

Since 1984, she has testified or otherwise provided linguistic expertise in more than 60 cases in the United States.

Her most significant contributions to forensic linguistics are her analyses of jury instructions (Dumas, 2000), consumer product warning labels (Dumas, 2010), and ambiguous language in nonstatutory language (Dumas, 1998). She has proposed a model for jury reform by recognizing that the role of the jury as finder of fact needs to challenge the judicial perception that the jury must be highly constrained and controlled.

She is best known to the nonacademic community for her study on jury instruction adequacy in capital cases (Dumas, 1996). She testified (via affidavit) in the case *Jacobs v. Johnson*, claiming that Charles Bruce Jacobs, who had been convicted in 1987 for capital murder in Dallas County, Texas, was sentenced to death by jurors who had not understood the meaning of the term *reasonable doubt*—or not the least that there was no evidence that jurors understood the term as the court had intended. Dumas argued that the jury instructions presented serious comprehension problems for both lexical and syntactic reasons, including the use of the archaic word “thereof,” difficult syntactic structure, failure to explicit what the options were and failure to clearly define the term “lesser included offense.” Dumas and the other experts participating in the case concluded that the death sentence was imposed by jurors who did not understand their instructions, which violates constitutional rights and the foundations of the US criminal justice system. In an attempt to improve the comprehensibility of jury instructions, she proposed a rewritten version of the instruction that replaced all the problematic words with more ordinary words, and the confusing syntactic constructions with simpler constructions. More recently (Dumas, 2009), she drew upon the demonstrated principle that rewriting jury instructions using principles of plain language enhances their comprehensibility to propose a general set of principles for writing comprehensible jury instructions.

The relevance of Dumas’s research and her institutional renown are attested by the number of fellowships and awards that she has received since 1970, as well as by the number of dissertations and theses directed, the institutional research and editorial positions held, and the media consulting that she has performed.

It is in her forensic discourse analysis that Dumas’s theory is grounded in practice. Her seminal work and her leadership in the area of language and the law and her contribution to enhancing the comprehensibility of jury instructions and product warnings have made an important contribution to work in the judiciary system.

Duranti, Alessandro

ELIZABETH KEATING

Among contemporary linguistic anthropologists, Alessandro Duranti is unique in the breadth of his research and in his interdisciplinary engagement in theorizing relationships between language and culture. His work can be understood as a career-long interest in human creativity as expressed in linguistic (and other semiotic) forms, and the mediating influence of these forms on culture and social life. His work is highly influenced not only by formal linguistics, but by European and American philosophical and anthropological traditions. His earliest academic work at the University of Rome was on Korean syntax and semantics, but after beginning PhD study in the United States he also became interested in the social life of linguistic forms. These interests were perfectly synthesized in his ethnographic work on the role of grammatical forms in accomplishing social action, for example, how ergative case marking in Samoan could be manipulated by village chiefs and orators to negotiate agency and responsibility, one of many observations about language and culture in *From Grammar to Politics: Linguistic Anthropology in a Western Samoan Village* (Duranti, 1994). Later ethnographic work on the campaign trail in California, a contest for a US Congress seat, is another example of Duranti's approach to language, the video recorded data proving to be a rich source for understanding genre, the collaborative construction of meaning, and the materialization of locally relevant, taken-for-granted concepts such as democracy (Duranti, 2003, 2006a). Throughout his work he has developed and expanded his notion of "ethnopragmatics" (Duranti, 1993a, 2007) beyond a focus on the contextual life of language, local communicative practices, and speakers' attitudes, and toward the meaning and impact of those practices to language as an expression and realization of human agency more generally. Duranti is perhaps best known for his work on intentionality, both as it is perceived locally in different world areas, and the role of discursive practices in defining it (Duranti, 1993b, 2006b, 2008a). Most recently he has been reinvestigating the writings of Husserl on phenomenology in order to contribute to perhaps the most challenging anthropological question, understanding intersubjectivity and the limits and nature of sharing the perspective of the "other" (Duranti, 2009, 2010).

Early American cultural anthropologists saw language as a repository of cultural knowledge accessible to investigation by an ethnographer learning the language, living in the community and engaging in its daily practices. In recent work by linguistic anthropologists, such as Duranti, this has expanded to include how to theorize about language itself, its role as a non-neutral medium, and its potential to shape ways of thinking and being in everyday ritual and nonritual acts with others. Culture is not only contained in the language of stories that are told but in the encounters that make the tellings possible, the types of organization that permit some to participate and others to be left out, who can be competent in storytelling, who can direct the tellings, or ask questions or answer them. Duranti's work on Samoan language practices, for example, includes special attention to the linguistic encoding and performing of social inequality. This was shown in everyday practices such as greetings (Duranti, 1997a), which establish and maintain relationships, in conflict settings (Duranti, 1990), as well in the institutionalized contexts of churches and schools (Duranti and Ochs, 1986). His early work in Samoa, a society with a complex history in anthropological thought, and later work among the Samoan-American community in Los Angeles, led to groundbreaking insights into the role of indexicality in creating

diasporic and globalized communities. It also led to new findings on literacy, particularly ways that Western cultural ideas permeate missionary-influenced schools through reading materials only partially adapted to local conditions, and the socialization of scientific discourse in Samoan-American households (Duranti, 1997b; Duranti and Ochs, 1997).

In his research, a sustained interest in verbal art and performance, especially what might be called the aesthetics of authorship and authority, manifests itself not only in an analysis of the formal properties of the speech forms *lauga* and *talanoaga* as they creatively emerge in Samoan oratory, or the way honorific forms are not used as predictably as speakers assume, but in his study of the role of the hearer in influencing speakers' talk. His examination of language use in public space has resulted in articles on code switching and conflict as well as on features of context. Context is highly underspecified in linguistic theories and in linguistic anthropology for the most part, although the use of new technological tools for data collection and analysis of complex materials (Duranti was a pioneer in this effort) have made rigorous investigations of the role of contextual features in meaning production possible.

An accomplished musician himself, he has always been interested in music as an aesthetic form, and recently how musicians use language and other symbolic practices to communicate and build harmonic, rhythmic, and melodic solutions (Duranti and Burrell, 2004). Using ethnographic methods to investigate the emergence, interpretation and dissemination of original creative forms led to new findings about the role of orality and written symbols in the aesthetics of improvisation among jazz musicians, which Duranti relates to verbal art genres in Samoa and elsewhere (Duranti, 2008b).

Duranti's approach and scholarship can be perhaps best seen in his book *Linguistic Anthropology* (1997c), which integrates anthropological theories and methods with the work of conversation analysts and philosophers of language. In all of his writing, the concept of participation is central.

Duranti has been a professor of anthropology at the University of California Los Angeles since 1988, where he is now dean of social sciences. He has played an important role in the shaping of the field of linguistic anthropology. He is past president of the Society for Linguistic Anthropology and past editor of the *Journal of Linguistic Anthropology*. He coedited and cofounded (with Bambi B. Schieffelin) the *IPrA Papers in Pragmatics* (later renamed *Pragmatics*), and was associate editor for *American Ethnologist*. He has authored five books and a long list of journal articles and chapters in edited volumes, and edited or coedited 10 books and special issues. He is a fellow of the American Academy of Arts and Sciences and the recipient of the prestigious John Simon Guggenheim Fellowship. Through his classes and seminars at UCLA and at a number of universities where he has been invited to lecture over the last 20 years, he has taught, supported, and encouraged many linguistic anthropologists entering the field.

Dynamic Assessment in Second Language Acquisition

MATTHEW E. POEHNER

Dynamic assessment (henceforth DA) is a structured approach to interaction in which a teacher or assessor cooperatively engages with learners, helping them extend their performance beyond levels they could reach independently (Haywood & Lidz, 2007; Poehner, 2008). DA is contingent upon careful provision of support attuned to learner needs, recognizing that overly explicit support may deprive learners of the opportunity to take control of their performance, while support that is too implicit is of little value. In the general psychological and educational research literatures, DA has been employed primarily in the context of standardized testing, and support has taken the form of carefully scripted hints and prompts. In this way, support is weighted and either accompanies or is included in learner scores. In the L2 field, DA has been more prevalent in classroom settings, where it typically unfolds dialogically. Thus, DA with L2 learners, the topic of this entry, is characterized by negotiation of support to remain in step with learners' emergent capabilities.

Pedagogically, the value of DA interactions resides in the quality of support, or mediation, which is distinctly developmental in orientation. That is, the purpose of mediation is not merely to scaffold learners so that they formulate a correct answer but rather to help them arrive at new understandings that will in turn orient future performances. In this regard, DA is a systematic, development-oriented framework for teaching in group or one-to-one settings. However, as its name implies, DA also functions as a diagnostic activity. While conventional assessments generally interpret learner performances in a dichotomous manner, documenting only correct and incorrect responses, and establishing the "ceiling" or "threshold" of learner abilities, DA requires active intervention when performance begins to deteriorate in order to determine how learners respond to mediation and what forms of mediation are most helpful in overcoming problems. From a DA perspective, learner responsiveness to mediation is crucial to understanding how near they are to fully independent functioning.

As should be clear from this description, DA conceives of teaching and assessment as an integrated, cooperative activity wherein interaction and negotiation of mediation reveal the range of learner abilities while simultaneously promoting those abilities. Before considering the theoretical basis and current leading models of DA, an example will help to concretize how DA may unfold with L2 learners. The following interaction, reported by Poehner (in preparation), concerns a learner of L2 French completing oral narration tasks and struggling to control verbal aspect, emphasizing actions or states as completed, or perfective, at the time of speaking, or as ongoing or imperfective (e.g., "The dog ate its food" or "The dog was eating its food").

In French, the distinction between present perfective and imperfective aspect is encoded through the *passé composé* and *imparfait*, respectively. In contrast to the rule-based presentation of this distinction found in most French language textbooks, the teacher in this program, M, explained the linguistic concept of verbal aspect and how perfective and imperfective are both used intentionally to depict relations among past actions and events.

2 DYNAMIC ASSESSMENT IN SECOND LANGUAGE ACQUISITION

Learners then attempted to follow this conceptual approach to regulate their use of *passé composé* and *imparfait* as they engaged in oral and written tasks, including narration. In the interaction below, a learner (A) is attempting to relate a scene from a film in which two male characters are discussing relationships and one offers advice to the other. A had originally produced the construction *il lui a dit qu'il devait parler avec Rebecca* ('He told him that he had to speak with Rebecca'), appropriately employing the perfective of the verb *dire* ('to say,' 'to tell') and imperfective of *devoir* ('to have to'). However, she subsequently expressed a lack of confidence in this selection and consulted with M. Rather than offering approval, M probes the reasons behind her selections:

1. M: so why *imparfait* rather than *passé composé* or
2. present tense or whatever?
3. A: um it's something that he should do he didn't
4. really indicate a specific time period but *lui a dit*
5. (said to him) because he said something to him very
6. specifically at that time but that he should talk to
7. him is kind of like open-ended did he do it or not
8. M: uh-huh yeah well now what if they used *passé*
9. *composé* what if someone said *il a dû parler avec*
10. *Rebecca* (he had to speak with Rebecca)? What about
11. that?
12. A: [does not respond]
13. M: because I agree with what you said about *imparfait*
14. I think that works that makes sense but what about the
15. *passé composé*?
16. A: I just . . . well I think that it would . . . [to self] I don't
17. know how to explain [aloud] it just sounds a lot more
18. specific than just a general piece of advice [to self]
19. yeah or [aloud] or that . . .

In lines 3–7, A offers a reasonable explanation for rendering the two verbs as she did. Her explanation suggests she is attempting to employ the concept of aspect as a basis for choosing between *passé composé* and *imparfait*. It is only when M continues to explore the depth of her understanding, asking her to comment on an alternative construction (lines 8–11), that she begins to experience a problem. A's initial silence (line 12) is followed by an attempt to think through the matter, during which she alternates between speech directed to M and barely audible speech directed to herself.

M does not end the interaction here but reminds A of a pair of exemplar constructions they had discussed earlier that illustrate the perfective–imperfective contrast: *il était malade* and *il a été malade*, both of which would be rendered in English as 'he was sick.' A explains the difference between the two formulations as follows:

20. A: with the *passé composé* there's a distinct beginning
21. and end so a distinct time period that it encompasses
22. and the *imparfait* is looser . . . so *il a été malade* (he was
23. sick) now it's already happened
24. M: right there's some kind of completion there
25. A: yeah
26. M: so in this case you said um what *il devait parler*
27. (he had to speak) versus *il a dû parler* (he had to
28. speak)?

29. A: so the *passé composé* il a dû parler (he had to
30. speak) . . .
31. M: it's kind of similar right?
32. A: so I guess like he needed to talk to her and he did
33. talk to her in a specific period of time and it's over
34. now
35. M: right you're looking at it as something that's
36. completed

M effectively shifts the focus of interaction away from the matter at hand, prompting A to consider the *malade* constructions, and she responds with an accurate explanation of how the perfective and imperfective impart distinct meanings. In lines 26–8, M reminds her of her own use of the imperfective with the verb *devoir* in her narrative, and A explains how the meaning would be altered by selecting the perfective.

This interaction illustrates several key DA features. Most evident, of course, is that this is an interaction rather than a monologue in which A simply composes her narrative in response to a prompt, as would occur in most forms of assessment. In a non-dynamic approach, M would have simply rated A's performance, likely missing or ignoring the subsequent verbalization of her reasoning. A would likewise not have had an opportunity to revisit and discuss her use of aspect with M. In other words, the diagnosis would have likely overestimated A's control of verbal aspect and A would have missed the opportunity to refine her understanding. Through interaction with the learner, it became clear that while she did in fact employ a conceptual understanding of aspect as a basis for making selections during her narratives, she was not yet able to independently alternate between regarding a given event or action as perfective, or as imperfective.

Another point to consider in this exchange is the quality of the interaction itself, and notably the contributions made by both M and A. Assessments tend to be marked by immediate identification of correct and incorrect answers, and even the ubiquitous initiation-response-evaluation interactional pattern in classrooms follows a preference for correcting errors, either implicitly or explicitly. Here, however, correction is withheld in favor of probing the reasons behind the learner's initial (appropriate) construction and prompting her to consider an alternative. M does not offer recasts or reformulations, but instead guides A to reorient to the present dilemma in light of constructions they had previously considered. Importantly, it is A and not M who explains the meaning of the contrasting *malade* constructions, just as it is A who ultimately interprets the meaning of the perfective of *devoir*. Had A needed more explicit mediation, including leading questions and hints, these certainly would have been offered as she and M collaboratively raised questions, considered possibilities, and revised utterances. An overt correction and even explanation of relevant underlying principles may also have been a part of the interaction, but only if other forms of mediation had failed to provoke an appropriate response. Stated succinctly, the point of DA is not to correct learner errors but to mediate learners to self-correct.

While the preceding example might easily be construed as effective teaching that supports the learner's development, the point of DA is that it is also an important source of information about learners' emergent abilities—that is, an assessment. This clearly contrasts with formal testing situations, where learners are required to perform in isolation and any interaction or external support is avoided for fear of contaminating the sample of their abilities. In testing, assessment and teaching are not merely separate but mutually exclusive activities, as the conditions necessary for *promoting* abilities are viewed as incompatible with those for *understanding* abilities. For this reason, DA is more often likened to *formative assessment*, where efforts are made to relate assessments to teaching. Formative assessment,

also referred to as *assessment-for-learning*, encompasses a range of practices designed to inform teachers of learners' understanding of what has been taught (and possible need for further instruction), and may include informal classroom interactions (see Black, Harrison, Lee, Marshall, & Wiliam, 2003). In this regard, the question has been raised as to the relation between DA and formative assessment, and the extent to which these may be different terms referring to the same phenomena (e.g., Leung, 2007). To appreciate the difference between DA and formative assessment, it is necessary to consider the centrality of theory to both.

Formative assessment practices vary widely (Rea-Dickins, 2007), and researchers have begun to draw upon a number of theoretical perspectives both for validation and conceptualization, including social constructivism, feminism, and postmodernism (see Moss, 2003). DA stands apart in that it is a concrete instantiation of principles that position theory and practice as an integrated whole, a dialectical unity of practical, critical activity that is at once theoretically motivated and the basis from which theory develops (Newman & Holzman, 1993; Vygotsky, 1997). This view is a recurring theme running through the writings of the Russian psychologist L. S. Vygotsky, originator of the sociocultural theory of mind (henceforth SCT) and upon which DA is based.

The central premise of Vygotsky's (1987) account of mind is that unlike with animals, human mental functioning is not exclusively determined by biological instinct and direct response to environmental stimuli but is instead shaped in fundamental ways through participation in culturally organized activities with others. Put simply, the world that humans inhabit is socially and culturally mediated. Through interaction with others we develop the means to control basic psychological functions, including perception, attention, and memory. One of Vygotsky's major insights was that to understand how culture mediates thinking it is important to follow what he termed an *historical* approach, wherein abilities are studied during the process of their formation. It is for this reason that Vygotsky's empirical research was most often conducted with children. Moreover, eschewing traditional experimental procedures, Vygotsky's studies generally involved deliberate and systematic intervention—that is, the provision of cultural forms of mediation intended to promote development—in order to understand processes of development. Far from undertaking dispassionate documentation of observable behaviors, Vygotsky (1998) framed psychological research as a dialectical activity concerned not with measuring but with interpreting individuals, and this process involves supporting their development.

Perhaps Vygotsky's most well-known contribution to psychology and education is his conceptualization of the "zone of proximal development," or ZPD. Generally described as the difference between what an individual can achieve independently and what s/he can achieve with assistance, the ZPD has been called upon to describe virtually any form of instructional interaction and any kind of learning.

To appreciate how Vygotsky understood the ZPD as both a central feature of his theory and a practical response to problems in education, it is helpful to recall the historical circumstances in which he was working. Specifically, Vygotsky's research activities were carried out at a time when the newly formed Soviet state was building a centralized, compulsory public education system. A challenge with which Vygotsky was immensely concerned was meeting the needs of the wide range of children entering the schools who came from varied language and cultural backgrounds, including some who suffered extreme poverty as well as those from remote rural communities where literacy was virtually nonexistent. Vygotsky's response was a decidedly forward-looking approach to diagnosing abilities, in which the focus of assessment shifts from products of past development and foregrounds responsiveness to mediation as a way of understanding potential future development. Bronfenbrenner (1977, p. 528) expresses this perspective through a statement he attributes to A. N. Leontiev: "American researchers are constantly seeking to discover

how the child came to be what he is; we in the USSR are striving to discover not how the child came to be what he is, but how he can become what he not yet is."

Vygotsky's initial use of the ZPD was as an alternative to conventional IQ tests, which he argued obscured processes behind performance and failed to capture abilities that were not yet fully developed but still emerging. Decades later, it was this application of the ZPD that captured the attention of psychologists in the West and eventually led to the first procedures described as "dynamic assessment" or DA (see Poehner, 2008). Vygotsky went on to advocate the ZPD as a basis for development-oriented pedagogies, reasoning that emergent abilities are most amenable to instructional intervention (Vygotsky, 1987, 1998). However, it is as a testing approach that the ZPD resonated most strongly with psychologists interested in assessing abilities and identifying learners with special needs. Consequently, DA practitioners have primarily concerned themselves with developing procedures for administering tests and other assessments that take account of learner responsiveness to mediation. In many cases, the assessment instruments are standardized tests and the mediation is scripted beforehand and arranged hierarchically from most to least implicit. The procedure is usually conducted by a clinical or school psychologist and the results, usually a score on the test as well as the number or level of mediating clues required, are reported and used as a basis for various decisions, including provision of special services. Lantolf and Poehner (2004) refer to these DA approaches as *interventionist*, noting that the extent to which teaching and assessment are integrated may be compromised as the priority is often to generate valid test scores rather than to promote development. Well-known models of interventionist DA include the "graduated prompt" approach (Brown & Ferrara, 1985) and the "*lerntest*" (Guthke, 1992).

Other DA practitioners have attempted to relate their assessments more directly to classroom teaching. For instance, in Greenberg's (2000) "cognitive enrichment advantage" method school psychologists collaborate with teachers to interpret results of DA procedures and generate recommendations for subsequent instruction, and Lidz's (2000) "curriculum-based DA" ties the assessment to instructional objectives and leads to individualized education plans for learners.

Nonetheless, teaching and assessment do not form the dialectical unity Vygotsky envisioned for his developmental pedagogy (Poehner, 2009). Minick (1987) has argued that the DA approach most closely aligned with Vygotsky is Feuerstein's "mediated learning experience" (MLE) (Feuerstein, Falik, Rand, & Feuerstein, 2003). In MLE standardization of the procedure is abandoned and tasks are completed jointly by the learner and the mediator, who is not limited in the forms of support s/he may offer. Owing to the highly dialogic and open-ended nature of Feuerstein's model, Lantolf and Poehner (2004) have termed this form of DA *interactionist*. Following Minick (1987), the flexibility of interactionist approaches affords the greatest potential for mediators to co-construct a ZPD with learners, as unforeseen problems may be pursued when they arise, the reasons behind learner choices may be discussed, and performances can be jointly reformulated. Indeed the L2 example presented earlier involving A and M illustrates these advantages. Conversely, the preference for standardization in interventionist DA, while perhaps limiting possibilities for creating a ZPD, nonetheless leads to assessment outcomes that are more easily interpretable using conventional means, including statistics. The decision of which DA approach best fits a particular context needs to take into consideration whether the primary focus is on the procedure itself and the need to generate scores to make comparisons or selections among learners, or whether it is on the learners' abilities and the goal of optimally promoting their development.

In the L2 field, DA has emerged only over the last several years (Lantolf & Poehner, 2004; Poehner & Lantolf, 2005), but has been quickly recognized as a powerful framework for integrating teaching and assessment as a unified activity that simultaneously offers

insights into learners' L2 abilities and promotes their development. While DA research in psychology and general education has focused predominantly on formal measures of ability, L2 DA studies to date have tended to favor classroom settings. Interactionist approaches have been followed in order to structure teacher–learner cooperative dialoguing as they work toward developing L2 abilities, including listening comprehension (Ableeva, 2008), oral narration (Poehner, 2008), and substantive-modifier accord (Lantolf & Poehner, in press). An issue that has arisen in this work concerns the feasibility of dyadic teacher–learner interactions in classrooms that routinely have 20 or more students. Poehner (2009) has begun to explore the possibility of *group dynamic assessment*, in which teachers endeavor to create a classroom ZPD, with learners who alternate between primary and secondary interactants in activities but are nonetheless able to attune to and benefit from mediation. Tasks employed must be beyond the capabilities of any individual learner, although some in the group will undoubtedly be closer to independently executing the tasks than others. A challenge to teachers is to continually challenge all learners, and this requires tracking the particular needs of each learner and the group.

Beyond negotiating the application of DA principles to particular L2 classrooms, there are ongoing efforts to implement DA in formal testing situations. Antón (2009) reports the use of DA in achievement testing of Spanish L2 learners' oral and written proficiency in a university undergraduate Spanish language program, arguing that a more nuanced view of learner abilities emerges through interactions. Erben, Ban, and Summers (2008) have implemented DA principles in the mandatory examinations of professional competencies which students must acquire as part of a preservice teacher education program. Their results document not only students' more positive attitude toward the exams, which they now perceive as learning opportunities rather than obstacles, but also a willingness on the part of some students to incorporate DA into their future classroom practice.

A project with which this author is currently involved seeks to develop a dynamic approach to language proficiency assessment that may be administered to large numbers of learners simultaneously. Standardized, multiple-choice tests of listening and reading comprehension in each of three languages—Chinese, French, and Russian—are administered via computer. Rather than a single attempt at each item, learners are permitted four tries, and after each incorrect response a mediating prompt of increasing explicitness is provided. In this way, the *computerized dynamic assessment* generates an overall score for the test as well as a profile of performance on individual sections of the test and the level of mediation required. Such information may be useful for placement decisions, as well as determining achievement and progression to higher levels of study. Each of these strands of research promises to deepen our appreciation of DA's relevance to L2 development, and additional applications will undoubtedly further refine our understanding of DA itself.

Dynamic Systems Theory Approaches to Second Language Acquisition

WANDER LOWIE

Introduction

Dynamic systems theory (DST) is a theory of change. Starting in the 1960s, the theory has been used extensively in a wide variety of disciplines, from physics to biology and from meteorology to demography. Essentially, DST is an application of mathematics, in which change of complex systems over time is expressed in dynamic equations that describe how these changes take place as a function of time. Each next developmental step (or *iteration*) is determined by the state of the system at the preceding moment, which leads to unpredictable, nonlinear developmental patterns. DST has provided powerful accounts for the nonlinear, iterative development of natural phenomena. Examples of applications of dynamic systems that show iterative changes over time are found in reaching dynamics (when we reach for a cup on the table, we iteratively adjust the trajectory of our movement) and weather forecasts in unstable atmospheric areas (tomorrow's weather can be predicted accurately, but long-term predictions are no more than educated guesses due to the large number of dynamic iterations).

Recently, applications of DST have been developed within cognitive science (Thelen & Smith, 1994; Port & van Gelder, 1995) developmental psychology (Van Geert, 1998), and language development (Elman, 1995). Since the late 1990s, the theory has also been applied to second language acquisition (SLA) (Larsen-Freeman, 1997; Herdina & Jessner, 2002; De Bot, Lowie, & Verspoor, 2007). These and many other authors have argued that language can be seen as a complex dynamic system and that language development is a nonlinear, chaotic, and highly individual process that cannot adequately be described from a static point of view. Different authors have used different terminologies for complex dynamic systems. This difference is mainly caused by parallel developments in different areas of research. Within the applications to language development, the terms "complex systems," "complex adaptive systems" (Ellis & Larsen-Freeman, 2009), and "dynamic systems" (De Bot et al., 2007) refer to similar approaches, although "dynamic systems" is more frequently associated with studies that use mathematical modeling (e.g., Caspi, 2010).

The arguments for considering (second) languages as complex dynamic systems revolve around three crucial characteristics that can suitably be applied to language and language development: the existence of interconnected subsystems; the tendency to self-organization; and the occurrence of nonlinear, chaotic patterns of development. Each of these characteristics will be discussed in some detail below.

Subsystems

An important characteristic of dynamic systems is that they are constituted by numerous embedded subsystems that interact dynamically (Thelen & Smith, 1994). The concept of embedded subsystems is best illustrated by a well-known example of a dynamic system: a flock of birds. The dynamically changing shape of the flock is caused by the movements

of the individual birds. Each bird in the flock can be seen as one subsystem in an interconnected set of subsystems. Subsystems are nested. Each subsystem can again consist of several nested, or embedded, subsystems. In the bird example, the bird's circulatory system, its skeletal system, its nervous system, and its digestive system are all subsystems that may again consist of subsystems. Similarly, the flock of birds is again embedded in its larger environment, characterized by a set of atmospheric conditions, such as humidity, wind, and temperature.

The application of subsystems to SLA is strongly associated with the model of the bilingual mind as proposed by Paradis (2004). Taking a neurolinguistic starting point, Paradis assumes the existence of subsystems within the language system, each of which has its own specialization, such as phonology, morphosyntax, and semantics. These subsystems are "isolable . . . and computationally autonomous . . . , have a specific purpose, and function as a component of a larger unit" (Paradis, 2004, p. 119). The nestedness of subsystems is also found in Paradis's model; within the linguistic subsystems (e.g., phonology, morphosyntax, and semantics), he assumes nested subsystems for each of the languages that a speaker is familiar with.

There is, however, one crucial difference between the way in which subsystems are defined by Paradis and dynamic subsystems. Basing his view on Fodor (1983), Paradis regards subsystems as modules that function only on each other's input and output, and holds that for each module "the internal functioning . . . is not affected by the internal structure or even the output of another module" (Paradis, 2004, p. 129). In a dynamic view, subsystems are not restricted to modularity, but actively interact with other subsystems. In an influential book on the continuity of human cognition, Spivey argues against the existence of self-contained modules, and maintains that cognition must be seen in terms of the "continuous probabilistic character of mental activity" (2007, p. 21). In this view, subsystems are not closed modules, but sets of related probabilistic computations over time. This means that subsystems in the dynamic sense are open and connected systems and that their internal structure is strongly interdependent on other subsystems. Evidence of the active interaction of subsystems can be found in the interaction between vision and language in Braille reading, expert lipreading, and the McGurk effect (Spivey, 2007). These examples show that cognitive subsystems are not only embedded in but also strongly interact with the physical subsystem, which is why cognitive subsystems are referred to as *embodied* (see also Lakoff & Johnson, 1999).

In sum, from a DST point of view, the language system can be assumed to consist of embedded subsystems for all levels of language production and perception, such as conceptualization, semantics, syntax, lexicon, phonology, and phonetics (also see Larsen-Freeman, 1997). Contrary to the modular approach, dynamic subsystems must be assumed to be open, interacting, and emergent systems (Spivey, 2007). Additional languages are not stored in different anatomical localizations, but may be considered as embedded functional subsystems in the dynamic sense, possibly nested within the phonological, morphosyntactic, and semantic subsystems, as proposed by Paradis (2004). This means that aspects of one language (e.g., the lexicon or the phonology) may affect those of other languages. This interaction is dynamic, meaning that it varies over time. In addition to the embeddedness of the language system within the cognitive system, the cognitive system itself has been shown to interact dynamically with the physical system of the body.

Self-Organizing State Space

A second characteristic of dynamic systems is that the global dynamic patterns of a system appear from the dynamic interaction of its subsystems. This is called "self-organization."

Self-organization occurs in any natural dynamic system, from cells in a body to the formation of sand dunes, and takes place in the system itself, in dynamic interaction with external influences. For instance, ripples in a sand dune emerge by the formation of sand grains according to the principles within the complex system of ripple formation. Self-organization is a very strong principle; even when the ripples are disturbed by footsteps in the sand, they will reemerge after some time.

In self-organization, the system as a whole is shaped by the interaction of lower-level subsystems. Research in the field of neuroscience shows that the coordinated behavior of the brain is also largely determined by self-organization (Kelso, 1995). The same conclusion is drawn from other findings in cognitive research. For instance, Van Orden, Holden, and Turvey (2003) show that the background noise in behavioral data recorded during reaction time experiments displays patterns of self-organization of purposeful behavior. Self-organization is also a key feature in current cognitive theories about language development. According to Van Geert, it is likely that language acquisition, like other phenomena expressing natural growth and development, is a self-organizational process (Van Geert, 2003, p. 659). Van Geert points out that self-organization can explain the emergence of complex grammar despite the poverty of input for the child acquiring language, and that no innate language learning property is required to account for the increase of language complexity. This position is corroborated by increasing amounts of evidence in favor of an emergentist view of language acquisition. Using computer simulations of connectionist neural networks, several studies of first language acquisition have shown that self-organization can give rise to the emergence of a complex language system (Li, Farkas, & Macwhinney, 2004). Similar positions have been taken for SLA (e.g., Hernandez, Li, & Macwhinney, 2005), and recently Ellis and Larsen-Freeman (2009) have provided additional evidence for the emergence of a second language (L2) system using a variety of measurements.

Due to their complexity as well as their constant fluctuations over time, self-organizing systems cannot be represented in a simple way. The situation in which a system is at one moment in time is its *state*. Since in dynamic systems many subsystems interact simultaneously, the state of a dynamic system is determined by the state of all of its subsystems. When the development of a subsystem over time is graphically projected, each of the system's subsystems makes up one of its many developmental dimensions. Since time is a crucial factor in dynamic systems, the description should take it into account that each of these dimensions can change. So the representation of the system describes the phase (in time) of each of the dimensions. The manifold of changing dimensions as a whole is therefore referred to as the multidimensional *phase state* of the system, which in mathematics is described as vectors in its *state space*. Each changing subsystem is one dimension in the system's state space.

Due to its inherent characteristics in relation to its sensitivity to external conditions, a dynamic system may be drawn to a point or path that specifies a particular volume of state space, called an *attractor state* (Thelen & Smith, 1994; Kelso, 1995). To take a strongly simplified example, the amplitude of a pendulum is determined by its physical characteristics in combination with gravity and friction. Given these characteristics, the pendulum is likely to follow a particular path, which can be seen as an *attractor* of the pendulum. Similarly, a system may be inclined to move away from certain states, which are referred to as *repellor states*.

To imagine the physical appearance of a phase state, a comparison is often made with a ball rolling over a surface that has both lumps (repellers) and holes (attractors). The movement of the ball can be seen as the trajectory of the system over time (Thelen & Smith, 1994). Since a complex system contains many dimensions, it can have multiple attractors and multiple repellers. A multitude of attractors and repellers creates "greater potential for any given trajectory to meander quite nonlinearly in its high dimensional state space"

(Spivey, 2007, p. 17). Not every attractor or repeller is equally strong; the holes can be deep or shallow, and the deeper a hole is, the more stable the attractor is and the more energy is needed to move the ball out of the hole.

Although attractors may cause parts of (sub)systems to be relatively stable, the entire state space can never be stable. Due to activity in some subsystems or changes in their environments, the system can be disturbed (*perturbation*) and consequently many dimensions of the state space can change, which can lead to a *phase shift* of the system (Abraham, 2003). From a DST perspective, this is how learning can be defined in terms of self-organization. With learning, “the entire attractor layout changes” (Kelso, 1995, p. 171). This view of learning is corroborated by studies of neural dynamics, showing that learning coincides with a dramatic reorganization of activity in neural populations (Jirsa & Kelso, 2000).

This implies that learning takes place over time, and is strongly dependent on the preceding state of the system. In other words, learning strongly depends on pre-existing knowledge. As Kelso puts it, “Learning, fundamentally, means the modification . . . of pre-existing capabilities,” and it either competes or cooperates with the learner’s existing capabilities (Kelso, 2003, p. 61). For language learning, the pre-existing capabilities include the state of any of the other languages a learner knows, and the state of any of the learner’s subsystems at one moment in time will determine the learner’s sensitivity to “input” at the next moment in time (Verspoor, Lowie, & De Bot, 2009). This interdependent view also implies that learning is not a gradual and smooth process, but may be abrupt and nonlinear as a result of competition and support between subsystems (Kelso, 2003). In sum, languages do not develop according to a predetermined sequence that is identical for all learners, but emerge as iterations from the system’s self-organizing state space in interaction with its environment. Consequently, language development is a highly individual process.

Many authors refer to changes of the multidimensional state space in terms of *growth* (Van Geert, 1995). To feed the process of growth of a system, it is dependent on resources. Applied to L2 development, resources comprise the learner’s internal capabilities, such as aptitude and working memory, as well as pre-existing capabilities and motivations. They also include external resources, such as the learner’s environment, time, and material resources (books, TVs) (De Bot et al., 2007). The growth of the system is largely dependent on the availability of resources. “Limitations on resources,” Van Geert argues, “are not only a delimiting factor on what would otherwise be exponential growth, but a crucial ‘driving force’ in development” (2003, p. 656). Focusing on a limited set of connected growers, several authors have simulated language development from a dynamic perspective. For instance, Bassano and Van Geert (2007) have investigated grammatical development by modeling a child’s utterance length recorded from longitudinal data. Their simulations enable them to identify transitions that are indicative of the emergence of grammatical structure and show competitive and supportive relationships between components in the system. Caspi (2010) investigates different levels of vocabulary knowledge using a growth model of longitudinal data of L2 learners of English and demonstrates precursor relationships between receptive and productive knowledge levels. These developments are still in their infancy, but the use of modeling techniques may prove to be a powerful tool to investigate the factors that affect the self-organization of dynamic language systems.

Nonlinear Development

Traditionally, SLA is seen as a linear process, with a clear starting point (no knowledge of the L2) and a clear end point (native-like proficiency in the L2). Not all learners will achieve the ultimate goal of native-like proficiency, and those who do not are assumed to

stop developing somewhere along the line. Traditional research has focused on the individual contribution of each of the factors in achieving, or failing to achieve, the ultimate goal.

From a DST perspective, a person's language is a fully integrated system. Within this framework, it is simply impossible to isolate single factors affecting the process of language acquisition, because the system is more than the sum of all these factors. Motivation, aptitude, and all the other "factors" are strongly interacting components or subsystems within the system, and they change as a function of the system's previous point of development within a developmental context. And since the context in which the system operates is again a system in itself, any change of the language system will also change its context. In principle, a dynamic system can show linear development, but real-life dynamic systems tend to be complex, as they emerge from the interaction of the components of the system and the context in which they develop. The development of complex dynamic systems can therefore be described as *nonlinear* (Van Geert, 2003). While linear relationships are strictly proportional, nonlinear relationships are not proportional and are therefore unpredictable.

Nonlinearity in L2 development is best illustrated by contrasting a linear view and a nonlinear view. In a linear understanding, the learner's development is essentially the sum of all the factors affecting the learner. The assumption is that if we knew all of the learner's characteristics, such as aptitude, motivation, anxiety, age, learning strategies, the input, and all other external and internal influences (which of course is purely hypothetical), the learner's development could be predicted. From a nonlinear point of view, this would not be possible, because each subsequent iteration of a dynamic system develops as a function of the interaction of its subsystems in constant flux with the environment. For instance, at moments that are characterized by high levels of anxiety, the amount of motivation may simply be irrelevant. Similarly, successful social interactions may dramatically increase the learner's motivation. In other words, a change in motivation at one point in time may trigger a change in any of the other subsystems at the next point in time. Consequently, the individual contributions of each of these interactions cannot explain the development. Or as Van Geert puts it, "the effect of a dynamic process differs from the sum of its parts" (2003, p. 657). This also means that from a DST perspective, language does not develop in predetermined structures or a representative design. Rather, language development emerges from the interaction of its components, each of which has its own timing properties and each of which dynamically interacts with its contexts.

This "unruly" behavior of the system is referred to as *chaos*. Although this term is commonly interpreted as "completely random" in everyday language use, *chaos* in the DST sense of the word is not the same as random behavior, as there are limitations and forces that may push the system in a certain direction (see "attractors," above). It rather means that the development is *nondeterministic*, or *stochastic*.

The nonlinear, erratic patterns of development are often manifested in a great deal of variation found in learner data. Longitudinal studies into aspects of L2 development have demonstrated the nondeterministic nature of development and have shown the relevance of variability. An early example of a study concentrating on learner variability is the work done by Cancino, Rosansky, Schumann, & Hatch (1978), who, in the vein of other studies in that era, attempted to explain the variability in their data in terms of external influences. A recent micro-genetic reanalysis of their data using a DST perspective (Verspoor, Lowie, & Van Dijk, 2008) shows that the amount of variability strongly fluctuates between progress and decay ("acquisition" and "attrition"). The analyses also show that increased variability leads to a subsequent increase in development, but not linearly and only as a function of the dynamic interaction of factors over time. As Larsen-Freeman puts it, "there are no discrete stages in which learners' performance is invariant, although there are

periods in which certain forms are dominant . . . There appears to be a need for the necessary building blocks to be in place in sufficient critical mass to move to a period where a different form dominates" (2006, p. 592). This observation accounts for the necessity of variation in learner data. Variability in the learner's system can be seen as a precursor condition to making progress.

The relationship between the amount of intra-individual variation and language development was also shown in a study by Van Dijk and Van Geert (2007) on the development of spatial prepositions. Using analytic techniques such as ProgMax and RegMin, these authors show that developmental transitions in their data are characterized by discontinuities of intra-individual variability. While in traditional approaches to L2 development variability is often regarded as undesirable noise that blurs the "true score" and that stands in the way of finding significant differences between groups or conditions, DST regards variability as an essential characteristic of the system's process of self-organization that may signal changes and transitions. From an evolutionary perspective, we could even say that nothing would ever change if there were no variation.

An important implication of its chaotic, nonlinear, and highly variable nature, is that there is no end state of language development. While a native speaker variety may be a learner's ultimate goal and could be seen as one of the attractors of the system, it is not the system's only attractor. Neither is it likely that all of the components of a dynamic system reach an attractor state simultaneously. If this happened, we could speak of true fossilization. But given the availability of sufficient energy and optimal circumstances (e.g., attention, motivation, and practice), an attractor state is not irreversible. Moreover, even a seemingly stable state may still show a considerable degree of variability. The development (progress or decay) of the dynamic language system takes place at many different timescales, from decades to milliseconds. At the decade level, the language system is greatly affected by important socioeconomic events in life, from the first school years to marriage, migration, and retirement (Lowie, Verspoor, & De Bot, 2009). At the millisecond level, language is affected by recency and associations of language forms in the context of their use (Lowie, Verspoor, & Seton, 2010). Seen in the light of the constantly changing and chaotic properties of a dynamic language system, simultaneously affected by social and cultural variables, affective variables, age-related variables, and crosslinguistic variables, the continuous development of the language system may temporarily slow down in some of its subsystems, but is unlikely to ever come to a halt.

Conclusion

As many authors have argued, the main characteristics of dynamic systems, such as interconnected subsystems, self-organization, and nonlinear development, are in line with the observed dynamic nature of L2 development (Larsen-Freeman, 1997; De Bot et al., 2007). The application of DST to L2 development is very recent, and in spite of a boost of research using this framework in the past few years many questions still remain to be answered, partly because the framework has not yet been fully developed. For instance, the very nature of linguistic subsystems, including the subsystems of different languages, needs further elaboration. From a DST perspective, subsystems cannot be regarded as closed modules that operate independently, but the precise nature of the way in which different languages are embedded in the system is as yet unclear. Both neurolinguistic and psycholinguistic studies are needed to resolve this issue. Also the nature of representations needs further attention. If Spivey (2007) is correct, and there are no *things* in the mind but only *processes*, the firmly established distinction between procedural knowledge and declarative knowledge can no longer be maintained, and even deeply rooted distinctions like syntax versus lexicon will need to be abandoned (see Elman, 2011).

This is why many authors working in the DST field of L2 development have argued that a new start must be made after a century of theory formation about language and language development. Even though both theory formation and empirical work can be expected to develop rapidly in this field, dynamic models of language cannot be developed overnight. Not only is theorizing needed, but also new research paradigms must be developed to investigate language perception and production within a continuity-of-mind framework. For instance, computer modeling of L2 data is promising, but needs further development. The strongly reductionist computer models may reveal very relevant aspects of dynamic relationships in L2 development, but tend to be limited in their implications. Traditional approaches to L2 development have often reduced the acquisition process to a series of discrete events. Proponents of a DST approach to L2 development argue for the recognition of language development as a continuous, multidimensional process. This view will require a further change from product-oriented research to process-oriented research and implies a need for more micro-genetic longitudinal studies over longer periods of time. Such studies will allow for analyses using advanced statistical techniques like autocorrelation and time series.

And finally, the new insights may result in the adjustment of language teaching practices. If language development is indeed a highly individual process, language pedagogy will have to accommodate this. Language pedagogy will also have to take it into account that learning entails changes in a *self-organizing* system. This implies that languages cannot be *taught* in an “information processing” sense of the word, but that language teaching can only aim at creating optimal conditions and perturbations that invoke the desired phase changes in the multidimensional state space of what we simply call “language.” There is nothing simple about that.

Dynamics of Multilingualism

ULRIKE JESSNER

Introduction

Although multilingualism is not a new phenomenon in human society, it seems that in the age of globalization there is a growing interest in research into the phenomenon of multilingualism. Research curiosity in multilingualism both as an individual (in the European academic discourse often referred to as “plurilingualism”) and as a social phenomenon has grown immensely over the last decades and, in this connection, scholars have started to develop more adequate theoretical frameworks oriented toward a multilingual norm. Although it has become widely known that language development in multilinguals changes over time and can include processes of language attrition or reactivation, numerous scholars interested in language acquisition still base their work on linear, static, and monolingual models of language development.

This entry will first focus on the complexity and diversity of language learning in multilinguals. Then dynamic systems theory (DST)/complexity theory (CT) as a new approach to investigating multilingual phenomena will be presented as an adequate thinking metaphor, if not a new theory, for the study of language development and multilingualism. The discussion will, therefore, start with a more general examination of the application of DST/CT to (second) language learning and then move on to the application of such an approach to the study of multilingual phenomena. The last section concentrates on the need for new perspectives in multilingualism research.

The Complexity and Diversity of Multilingualism

Since the mid-1990s, research on third language acquisition (TLA) and language learning in multilinguals or multilingualism has been increasingly intensified with the main goal being to describe multilingual phenomena in order to investigate differences and similarities between second and third language acquisition (see, e.g., Cenoz, Hufeisen, & Jessner, 2001, 2003; De Angelis, 2007; Aronin & Hufeisen, 2009a). An overview of the new discipline reveals that scholars have focused on sociolinguistic, psycholinguistic, and educational aspects of multilingualism. So far studies have mainly been carried out in the fields of crosslinguistic influence, the cognitive and linguistic effects of bilingualism on TLA, multilingual processing, child trilingualism, and teaching of third languages (see Jessner, 2008a; Hufeisen & Jessner, 2009). In recent years, differently oriented studies have been added which are concerned with the neurolinguistic aspects of the phenomenon (for a critical view see de Bot, 2008) or the economic value of learning more languages (Grin, Sfreddo, & Vaillancourt, 2010). The increase in studies on the contact of more than two languages has also forced researchers to rethink definitions used in a complex field with diverse interdisciplinary interests.

Terminology

The term “multilingualism” covers a range of meanings. Whereas multilingualism is often used to refer to bilingualism (the most commonly studied form of multilingualism), a growing number of researchers take the strong stand that bi-, tri-, and quadrilingualism should be seen as subtypes of multilingualism. They also believe that TLA is not extended second language acquisition (SLA) but presents a different language-learning process in various respects (see Jessner, 2008a). All in all, in the field of multilingualism, a variety of terms have been used to refer to identical phenomena. The variety of terms and their origins derive from (a) the complex nature of use of various languages in a multilingual context and (b) the researchers’ backgrounds, ideologies, and purposes (for a detailed discussion see Kemp, 2009).

Additionally, the roles of L1 and L2 were clearly defined in traditional language-acquisition research until studies on language attrition started questioning the usefulness of the terminology in case of transitional bilingualism. Putting the research focus on the dynamics of multilingual (in the sense of more than two languages) development has certainly added more terminological problems. It has become clear that from a long-term perspective the term “L1” cannot easily be applied to a context where multiple languages are learned since dominance (level of proficiency or frequency of use) does not necessarily correspond to chronological order of acquisition.

Crosslinguistic Influence in TLA and the L2 Status

Crosslinguistic influences in a multilingual system not only take place from the first language to the second and vice versa but have also been detected from the L1 to the L3 and from the L2 to the L3 and vice versa. Combined crosslinguistic influence occurs “when two or more languages interact with one another and concur in influencing the target language, or when one language influences another, and the already influenced language in turn influences another language in the process of being acquired” (De Angelis, 2007, p. 21). This expansion of transfer possibilities shows that multilingual acquisition is a far more complex process than second language acquisition (SLA), where the role of the L1 in the development of the L2 has been researched extensively.

One of the most crucial questions in psycholinguistic research on TLA is related to the status of the L2 in third language learning. In a number of studies it turned out that in L3 production the speakers did not rely on their L1 as expected, but on their L2, and in several studies of learning an L3 of Indo-European origin it could be shown that L3 learners whose L1 is typologically unrelated to the L2 or L3 tend to transfer knowledge from their L2 or in the case of bilinguals from the related L1 (for an overview and list of TLA studies see Jessner, 2008a). The activation of prior language knowledge is influenced by factors such as psychotypology (perceived linguistic distance between languages), recency of use, the level of proficiency in the target language, the foreign-language effect, the tendency in language learners to activate an earlier second language in L3 performance, and the learner’s perception of correctness of a target word (for an overview see De Angelis & Dewaele, 2009; Ó Laoire & Singleton, 2009).

Forms of Multilingual Learning

In contrast to second language acquisition there is a greater diversity when more than two languages are acquired. In TLA at least four forms of acquisition have been identified:

1. the three languages can be learned consecutively;
2. the three languages can be learned simultaneously;
3. L1 and L2 are learned simultaneously before learning the L3;
4. L2 and L3 are learned simultaneously after the acquisition of the L1.

If more languages are involved the number of forms increases. In their overview of forms of acquisition of seven languages Todeva and Cenoz (2009, p. 7) present 32 possibilities.

Multilingual Use

In many contexts in the world more than one language is used on a daily basis. Multilingualism can be encountered as an institutional, societal, discursive, and individual phenomenon. In Malaysia, for instance, it is common that language skills are developed in various languages for use in certain domains but that language proficiency in those languages is rather limited (Kärchner-Ober, 2009). This phenomenon is quite common in multilingual contexts and has led to the redefinition of multilingualism as a phenomenon which views language choice and proficiency as necessarily dependent on use in specific domains of life, thereby moving away from the notion of multiple monolingualism (Baker, 2006). The fact that “different aspects of life often require different languages” is called the “complementarity principle” by Grosjean (2010, p. 29).

Applying Dynamic Systems Theory to Multilingualism

Systems research has been known in other sciences such as meteorology, mathematics, neurology, psychology, and so on for some time (see overview of research in Briggs & Peat, 1989). Linguistics, or rather applied linguistics, has only recently started to focus on the usefulness of such approaches (Larsen-Freeman, 1997; Meara, 1999), but since 2000 interest in the application of DST to second language acquisition or multilingualism has grown considerably (Herdina & Jessner, 2002; Kramsch, 2002; De Bot, Lowie, & Verspoor, 2007; Larsen-Freeman & Cameron, 2008; Aronin & Hufeisen, 2009a). The most common terms used in academic discourse are chaos theory, ecological models, emergentism, dynamic systems theory (DST), and complexity theory (CT), and they all focus on the understanding of the behavior and organization of dynamic systems.

The dynamic model of multilingualism (DMM) applies DST to multilingual development and use (Herdina & Jessner, 2002). In DMM it is emphasized that “multilingualism” necessarily embraces all types of language acquisition but also concentrates on the changes in language learning in a multilingual context. In the following the main contributions that a DST approach offers to the study of multilingualism will be discussed.

Relating the Socio- to the Psycholinguistic Level of Multilingualism

According to DMM, the individual multilingual system is dynamic and adaptive. As an adaptive system the multilingual system, characterized by nonlinear growth and continuous change, possesses the properties of elasticity, the ability to adapt to temporary changes in the systems environment, and plasticity, the ability to develop new systems properties in response to altered conditions. A DST approach is able to take into account all the relevant characteristics of multilingual learning and use, such as nonlinearity, including language attrition as a common phenomenon of multilingual systems, and complexity in a changing system. Such an approach uses dynamic modelling to investigate properties of the dynamic adaptation to contexts in change.

DMM focuses on language development and language use in multilinguals as inter-dependent areas of language learning. Variation in multilingual development and use is strongly linked to the dependence of the system on social, psycholinguistic, and individual factors, not to mention the mode of language learning in the form of either natural or instructional learning, or various combinations of the two. For instance, the complexity and variability of the multilingual system are also influenced by individual cognitive factors such as motivation, anxiety, language aptitude, self-esteem, and so on, as well as social factors which can show influence on the linguistic aspects of the multilingual system.

As described by Briggs and Peat (1989, p. 148), “every complex system is a changing part of a greater whole, a nesting of larger and larger wholes.” As already mentioned, emotions and other psychological factors play a bigger role than has long been assumed.

According to Larsen-Freeman and Cameron (2008) the intrinsic dynamics of the language learner are governed by social context, physical environment, and cognitive context so that learning and change are at once individual and social. Linguistic aspects of individual multilingualism are therefore shaped by the sociolinguistic settings in which the multilingual’s life takes place. In 1965 Lambert established the distinction between additive and subtractive bilingualism because he was in need of an explanation of seemingly controversial results in early bilingual studies (see Lambert, 1977). It turned out that the factor of language prestige can exert enormous influence on various language-contact situations. More recently, Cenoz (2009) pointed out that vitality and status of languages have to be taken into account in studies of crosslinguistic influence and multilingualism.

Aronin and Ó Laoire (2003) present an ecological model of multilinguality or individual multilingualism. They state that multilinguality is intertwined with many, if not all, aspects of identity. The social and cultural environment plays a decisive role in the structure and specifications of multilinguality; in other words, language needs change according to the personal situation or even changes in identity, as found in the lives of migrants. Therefore, and for other reasons, in DMM perceived communicative needs, which are psychologically and sociologically determined and can also be subject to change, are identified as the driving force of language learning, language choice, and use. The speaker decides which language to use with whom and in which situation. And also when and why another language should be added to the multilingual’s repertoire. One’s decision to speak a particular language to a particular person at a particular moment is influenced by a number of factors such as language proficiency, language-mixing habits and attitudes, usual mode of interaction, kinship relation, socioeconomic status, situation, such as physical location, presence of monolinguals, degree of formality and of intimacy, and so on. According to Grosjean (2001) a trilingual person can function in a monolingual, bilingual, or trilingual mode with various levels of activation.

Holistic Thinking as a DST-Based Principle

In DMM a holistic approach is the necessary prerequisite for understanding the dynamic interaction between complex systems within a multilingual system. Such a view is a necessary presupposition of a dynamic view of multilingualism and assumes that the presence of one or more language systems influences not only the development of the second language but also the development of the overall multilingual system. The behavior of each individual language system in a multilingual system largely depends on the behavior of previous and subsequent systems, and it would therefore not make sense to look at the systems in isolation. Therefore in DMM, unlike mainstream SLA research, language systems are seen as interdependent and not as autonomous systems.

In other holistic approaches the relationship between the dynamics of language development and holism has not been discussed in particular. Cook (2006) introduces the concept of multicompetence, which he bases on Grosjean’s work on the bilingual as a competent but specific speaker-hearer (2010). Since its creation, multicompetence as a kind of super-system differing in distinct ways from the knowledge of monolinguals has established itself as the most widely used term for bilingual (and multilingual) competence in applied linguistics. In DMM, which acknowledges Cook’s work, multilingual proficiency is defined as the dynamic interaction between the various psycholinguistic systems (LS_1 , LS_2 , LS_3 , LS_n) in which the individual languages (L_1 , L_2 , L_3 , L_n) are embedded, crosslinguistic interaction, and what is called the M(ultilingualism)-factor. The latter refers to all the effects

in multilingual systems which distinguish a multilingual from a monolingual system, that is all those qualities which develop in a multilingual speaker/learner due to the increase in language contact(s) (see studies on the M-factor by, e.g., Peyer, Kaiser, & Berthele, 2010). Crosslinguistic interaction (CLIN) in multilinguals also refers to cognitive phenomena, a view which in the meantime has also been adopted by other researchers working on crosslinguistic influence, such as Jarvis and Pavlenko (2008).

The Butterfly Effect or Sensitive Dependence on Initial Conditions

The M(ultilingualism)-factor is an emergent property, which can contribute to the catalytic or accelerating effects in TLA. The multilingual system is not only in constant change but the multilingual learner also develops certain skills and abilities that the monolingual speaker lacks.

These are language-specific and non-language-specific or cognitive skills used in language learning, language management, and maintenance. In particular in the case of typologically related languages, a catalytic effect, that is a qualitative change in further language learning, has been detected in experienced language learners. What these skills and abilities have in common is their relatedness to a heightened level of metalinguistic awareness in multilingual learners and users, which can be seen as a function of the interaction between the systems. Metalinguistic knowledge or awareness of this knowledge influences further language learning or learning a second foreign language (see Jessner, 2006).

Whereas in SLA the learner refers to a monolingual norm, that is she or he bases second language learning on the acquisition of the first language (Herdina & Jessner, 2002, p. 131), in TLA a metasystem in multilinguals, which is the result of a bilingual norm, is developed. Following Lorenz (1972), who used the butterfly effect or sensitive dependence on initial conditions to refer to the unpredictability of dynamic systems, in DMM an M-effect which refers to this qualitative change in third language learning is assumed to exist in multilingual systems.

Challenges for Future Research

One of the main goals for future studies on multilingualism is to develop new perspectives which can meet the complexity of the field (Aronin & Hufeisen, 2009a). If we want to make moves in the field, a strong focus needs to be placed on the assessment of multilingual proficiency and this needs to be done from a holistic, DST-based perspective. This implies that in order to provide realistic or fair assessment of individual multilingualism all components of multilingual proficiency have to be included in the assessment, thereby going beyond purely linguistic measures. It has to be made clear not only that multilingual development can only be captured from a dynamic perspective but also that the complexity of multilingual proficiency needs to be included in the assessment (see for instance, De Angelis & Jessner, *in press*). One of the main subjects of future inquiry is the operationalization of metalinguistic awareness, previously suggested in Jessner (2008b).

Dynamic systems theory/complexity theory not only offers inspiring and challenging perspectives to the study of multilingualism, but also proposes abandoning old trails of thinking and avoiding falling back into old ways of thinking. As suggested by Aronin and Hufeisen (2009b), it is absolutely necessary to cross the second threshold, that is, following the crucial contributions by Grosjean and Cook on the bilingual view of bilingualism, we now have come to see that multilingualism can only be adequately researched by applying a multilingual norm to linguistic research. New perspectives such as those provided by Todeva and Cenoz (2009), who combined the emic (the multilingual's) perspective with the etic (the researcher's) perspective of multilingualism and applied dynamic systems

theory to multilingual narratives, present a most promising step forward in the development of the field.

Eades, Diana

KATE HAWORTH

Dr Diana Eades (1953–) is a key figure in the field of forensic linguistics (FL), especially due to her work on linguistic disadvantage faced by speakers of Aboriginal English in the Australian legal system. An important aspect of her work is a dedication to the practical, applied use of linguistic research for the furtherance of equality and justice, especially through increasing understanding within the legal system (and other professional groups) of the communicative challenges faced by speakers of nonstandard language varieties. Eades has been involved in FL since its earliest days, has acted as an expert linguistic witness in several cases, and has published extensively on FL-related topics for over 20 years to date. Key publications include the 1995 edited collection, *Language in Evidence: Issues Confronting Aboriginal and Multicultural Australia* (Eades, 1995a); *Courtroom Talk and Neocolonial Control* (Eades, 2008a), a critical sociolinguistic analysis of language and power in the courtroom; and *Sociolinguistics and the Legal Process* (Eades, 2010), an accessible introduction to this area. She continues to be an active and highly respected figure in the field.

Eades's initial research, including her PhD from the University of Queensland (Eades, 1983), involved ethnographic study of Aboriginal languages and communicative practices, which led to an involvement with Australian Aboriginal English in the legal process (see cases below). After holding posts as lecturer and senior lecturer at the University of New England, NSW, Australia, she became an associate professor at the University of Hawai'i, where she was actively involved in projects supporting the pidgin-speaking community, including in legal contexts through her membership of the State of Hawai'i Supreme Court Committee on Equality and Access to the Courts (1999–2002; 2002–5). In 2004 she moved to her current post as Honorary Research Fellow in the School of Behavioural, Cognitive, and Social Sciences at the University of New England, NSW, Australia.

Throughout this academic career, she has maintained an active research interest in language in the legal process, and especially issues of power, dominance, and social inequality as enacted and perpetuated through discursive practices. Her methodological approach, which she describes as critical sociolinguistics, involves detailed qualitative analysis of talk in legal contexts, and draws primarily on interactional sociolinguistics and ethnography of communication, integrated with analysis of the sociopolitical context in which the talk is produced. An important aspect of her work has been a recognition of the significance of pragmatic differences between Australian Aboriginal English (AE) and Standard English (SE), including the use of silence and of questions (e.g., Eades, 1993, 1994, 1996). These language features have a significant role to play in most legal contexts, especially the courtroom and the interview room, and Eades's work in this area is therefore of special interest and relevance.

Her research on communicative differences between AE and SE led to her involvement in several cases as an expert witness, including *R v Condren* (1987 *Australian Criminal Reports* 28, 261–99, Queensland Court of Criminal Appeal—see Eades, 1993, 1995b), and *R v Kina* (1993, unreported, Queensland Court of Appeal, November 29—see Eades, 1996). The main case with which Eades is associated is what is known as 'the Pinkenba case' (*Crawford v Venardos & Ors* 1995, unreported, Brisbane Magistrates' Court, February 24), in which

police officers were charged with unlawfully depriving three Aboriginal boys of their liberty by driving them to a remote location “to reflect on their misdemeanours” (Eades, 2008a, p. 8), and then abandoning them there. Yet at a preliminary hearing, the case against the officers was dismissed after lengthy cross-examination of the boys which discredited both their story and their character. Eades’s detailed analysis of the cross-examination, which is the focus of Eades (2008a), shows how the lawyers achieved this outcome by using linguistic strategies which exploited Aboriginal modes of communication (see also e.g., Eades, 2002, 2004, 2006).

A notable success of Eades’s in bridging the gap between linguistic research and legal practice has been the publication of a handbook on Australian Aboriginal English written specifically for lawyers (Eades, 1992), which has made a direct and important contribution to reducing the disadvantage faced by Aboriginals in legal contexts. This practical impact is reflected in the fact that her work has on numerous occasions been cited in court judgments, official publications, and benchbooks. The 1992 handbook was adapted and republished in 2000 as *Aboriginal English in the Courts: A Handbook*, by the Queensland Department of Justice.

Eades has also turned her expert attention to the area of language analysis for the determination of origins (e.g., Eades, 2005, 2008b; Eades & Arends, 2004b). In response to growing concerns in a number of countries about the lack of linguistic validity in the official use of language analysis for the identification of national origin of asylum seekers, in 2004 she was part of an international group of linguists which produced ‘Guidelines for the Use of Language Analysis in Relation to Questions of National Origin in Refugee Cases’ (Language and National Origin Group, 2004). She also coedited a special section of the *International Journal of Speech, Language and the Law* on the topic (Eades & Arends, 2004a).

Eades was President of the International Association of Forensic Linguists (IAFL) from 1995 to 1999, and has also held the positions of Vice President (1999–2001) and Secretary (2005–9). She convened the second International IAFL Conference in 1995. She is currently coeditor of the *International Journal of Speech, Language and the Law*. She has also held the position of Vice President of the Australian Linguistics Society (1990–4), and is currently on the Editorial Board of the journal *Applied Linguistics*.

Early Bilingual Education

TINA HICKEY

“Early bilingual education” refers to a number of models of early years education offered to children aged between two and about five or six years. It operates at the critical nexus between home and school, offering children an opportunity to acquire a second language or to enrich their home language. Preschool education has long been recognized as promoting children’s social and intellectual development, and in many countries children are also offered the opportunity to attend preschools where the medium of instruction is another language such as a heritage language, a nondominant local language, or a dominant language of another country. The models used vary, reflecting the different needs of multilingual countries as well as provision for migrant populations. This topic overlaps with *immersion education*, which tends to be defined as immersion education beginning in kindergarten and progressing through primary school.

Early bilingual education encompasses two basic models. *Dual immersion models* expose children to two languages in the preschool, one of which may be the native language of some or all of the children, and the other the dominant language of that community. An example of this model is the Spanish–English dual immersion program in the United States, where children receive part of their instruction through each language. The aim is to develop bilingual competence in both groups of children and to show parity of esteem to each language and culture. Such bilingual early education may be part of a bilingual education program that continues through elementary school and beyond, or it may be transitional, to offer short-term support to minority language children’s L1 skills and to develop their L2 skills in preparation for mainstream schools.

Monolingual immersion models also aim to develop bilingualism, but use only one language as the medium of instruction. This model can be subdivided into two. The first is programs that use children’s second language (henceforth L2) as the medium of instruction, with the aim of adding it to their unthreatened first language (henceforth L1). Such programs are sometimes characterized as promoting “elite bilingualism” (de Mejía, 2002), since the language added tends to be of relatively high status and poses no threat of replacing the children’s mother tongue. An example is the classic Canadian immersion model, where children are taught through their L2 (French), while their mother tongue (English) is under no threat.

The second sub-model uses minority language children’s home language as the medium of instruction, to support and extend it before they are exposed to the majority or community language, as a basis for later bilingualism. This type is found in Wales, in Welsh-medium preschools attended by both Welsh native speakers and English speakers learning Welsh. Such monolingual minority language preschools often are part of language revitalization movements aiming to develop bilingualism through consolidating the nondominant language in young native speakers before it is overwhelmed by the majority language, as well as helping L2 learners to acquire it. The need to support threatened home languages arises because of erosion of domains of use, limited numbers of speakers outside the home, and variations in parental proficiency and input. These pressures can affect children’s cognitive and academic development, and therefore preschool education through the minority language can help children to develop their mother tongue—and their cognitive skills

through that language—and to form peer-group networks through the minority language, helping to prevent marginalization and low self-esteem. This model is applied in revitalization efforts worldwide, in the teaching of Basque, Catalan, Frisian, Irish, and Māori, for example.

Baker and Jones (1998) note that both these monolingual and bilingual preschool models represent a “strong” form of bilingual education, maintaining minority first languages and adding new languages to children’s repertoires. They contrast this with “weak” bilingual education: mainstream settings attended by migrant children which focus on developing competence in the dominant language, at best offering only transitional support for children’s L1, mainly as preparation for L2 instruction. Mainstream monolingual dominant language settings with no special provision for migrant children offer submersion rather than bilingual education, frequently leading to loss or attenuation of the child’s mother tongue and inadequate development of the target language that impedes cognitive and academic development.

Pedagogical Approaches

High-quality early years education has: clearly defined aims and objectives; a central role for play and talk; a developmentally appropriate curriculum for physical, social, emotional, and intellectual development with regular curriculum review; well-trained teachers working under knowledgeable supervision; small groups with a low pupil–teacher ratio; and meaningful participation by parents as educational partners. Edelenbos, Johnstone, and Kubanek’s (2006) review of effective pedagogical practice in teaching foreign languages to young learners identified factors contributing to successful language learning relevant to both bilingual and monolingual models of early bilingual education, such as well-trained, resourced, and supported teachers with expertise in the target language and in language pedagogy. Folklinguistic beliefs about the “naturalness” with which young children learn languages need to be reviewed in light of research, and should not be interpreted as reducing the need for fluent, well-trained early years teachers with good knowledge of language pedagogy and an understanding of the role of play and talk in early education.

An adequate response to L1 minority language speakers’ needs requires the development of appropriate teacher training, curricula, and work organization, as well as extra personnel to allow regular grouping by language ability. Delivery of pedagogically and linguistically appropriate provision in a minority language or through a child’s L2 poses significant challenges, and requires bottom-up planning in order to integrate language teaching and enrichment effectively with the rest of the curriculum (Hickey, 2001). Every routine and learning activity of the early years’ curriculum offers valuable language learning opportunities when suitably adapted. That adaptation includes marrying linguistically appropriate input with hands-on experience for children, with teachers using gesture, mime, and props, as well as offering appropriate simplification/repetition to help comprehension and take-up by L2 learners. In mixed groups of L1 speakers and L2 learners, L1 children also have needs, for enriched input and vocabulary development through more challenging stories and activities, and teachers need training and sensitivity in order to provide children with appropriate input for their different levels of language competence, while simultaneously supporting the other aspects of their development.

Offering developmentally appropriate activities and learning through play is highly demanding. Flexible work planning, rather than a “one size fits all” approach, is required in order to adapt to different language balances in different classrooms (Hickey, 2007). When the majority of children are L2 learners, there needs to be an awareness of the value of maximizing input from the teacher, who is the main source of target language input.

On the other hand, children who are able to speak the target language may have a different balance between teacher-led activities and activities with peers, provided use of that language is actively supported by grouping them with other L1 speakers regularly. This requires a shift in focus from *de facto* prioritization of L2 learning in such mixed groups, to equal provision for effective L1 maintenance and enrichment.

Dual Language Immersion Preschools

Two-way immersion programs in the United States group English-speaking and Spanish-speaking children, usually from kindergarten up. They aim to develop high levels of L2 proficiency in English speakers at no cost to their academic progress, and to provide mother tongue support for Spanish speakers and help their academic progress while they are acquiring English as L2. Providing at least some of the instruction through the nondominant language has been shown to help these minority children, despite the popular assumption that more time spent on the dominant language would benefit them more. Thomas and Collier (2002) show that the longer the support for the mother tongue, the better the school results for nondominant language children. Two-way immersion programs plan when each language is used, by allocating blocks of time (and sometimes different teachers) to activities in each language, so that children have access to age-appropriate input from native-speaker teachers. Barnet, Yarosz, Thomas, Jung, and Blanco (2007) compared the results of a two-way immersion preschool with a monolingual English immersion preschool for Spanish-speaking and English-speaking children. They found that the two-way immersion approach improved the Spanish of both the Spanish speakers and the English speakers, without losses in English language learning for either. However, Valdés (1997) cautions that the twin aims of two-way immersion—promoting L2 acquisition among majority language children, and education through their mother tongue for minority language children—have very different agendas, which need regular review with reference to inter-group relations and societal power structures.

Other applications of the dual-language model in early years settings include the “Hand in Hand” program in Israel (Amara, Azaiza, Hertz-Lazarowitz, & Mor-Sommerfeld, 2009), where Hebrew- and Arabic-speaking children are integrated in each class, with a teacher of each language team-teaching all subjects together. The model aims both to raise children’s proficiency in the two languages, and to increase tolerance of diversity in a conflict situation. In other contexts, some schools in European Union countries offer European classes, starting with the youngest children, where half of the class are speakers of the national language and half of another language, teaching the whole curriculum in both languages (e.g., Europaschule Berlin offers German–Portuguese, German–Turkish, and German–English sections).

Early Bilingual Education: The Monolingual Dominant Language Model

This is the classic immersion model, in which a group of dominant language children are taught through the medium of another language. Variants of this model are now practiced internationally, with parents seeing social, economic, or cultural value in exposing their children early to a dominant language. This may partly be due to parents believing that young children “pick up” languages easily, although the research points to the advantage of starting young for acquiring an authentic accent in the L2 rather than speed of acquisition. The belief that preschoolers find language learning easy may be due to the fact that the demands made on them are relatively light, and that the language input to them is

grounded in “hands-on” experiences, daily routines, and self-explanatory activities, and in simple interactions with others, which aids comprehension and take-up. Young children are naturally motivated to take part in playful activities and less self-conscious about errors than older learners. Parents may be particularly attracted to early bilingual education because it seems less risky in terms of academic outcome than immersion education during the later school years. Parent- and state-led growth in monolingual dominant language preschooling is evident in the expansion of English immersion in countries such as Croatia, Italy, Hungary, and Israel (see Nikolov, 2010), and in China (Feng & Sunuodula, 2009). However, the EU’s recommendation that citizens speak “mother tongue plus two” other languages has also contributed to some expansion of immersion preschooling in other languages (e.g., the Spanish-medium preschool in London; see Kenner & Hickey, 2008).

Nondominant Languages in Early Bilingual Education

Preschooling through the medium of lesser-used languages has played a pivotal role in the revitalization movements of many minority/heritage languages. It is generally easier for parents and language activists to establish a preschool offering an appropriate curriculum through a nondominant language than to attempt to establish a primary school. Surveys of pre-primary provision in lesser-used languages in Europe (van der Goot, Renkema, & Stuijt, 1994) have highlighted the importance of providing monolingual preschool immersion in endangered languages both to native speakers, who may be in need of mother tongue development and enrichment (Baker & Jones, 1998), and to dominant language children learning the target language as L2. Such provision helps to raise the status of the minority language in children’s eyes, as well as in the local community, and promotes awareness of the need to maintain the language. Preschool education through the minority language confers sociocognitive benefits on the mother tongue speakers, helping them to consolidate their L1 skills and develop cognitively before acquiring the dominant language later. One example is the Irish-medium preschools known as *naíonraí*, which offer early immersion in Irish as L2 for the majority of children coming from English-speaking homes, but also provide mother tongue pre-primary education for the minority who are native speakers of Irish (Hickey, 2001). Other examples where preschool education has figured prominently in the growth of bilingual educational provision in revitalization movements include Māori’s *Kohanga Reo* (“language nests”) in Aotearoa/New Zealand (King, 2001), Welsh *cylchoedd meithrin* in Wales (Jones & Martin-Jones, 2004), and Basque *ikastolas* (Elorza & Munoa, 2008).

For many nondominant language children in postcolonial and other contexts in Africa, Asia, and Latin America, access to school is limited when education is delivered through a dominant language in an unfamiliar cultural context. Early bilingual education has been found to be an important factor in improving access to education in these contexts. Provision of mother tongue support preschools has been encouraged by UNESCO, UNICEF, and Save the Children as a way of promoting access to basic education, on the basis that it allows development of cognitive academic and linguistic proficiency in the home language, which transfers later to their L2. Research in Indian tribal groups (MacKenzie, 2009) has demonstrated that when preschool education begins in the nondominant home language, it allows children to develop their L1 skills and to begin to build competence in the L2 before they have to learn through it, resulting in better academic progress for these children, and lower drop-out rates.

Even where there is state support for preschool immersion in a nondominant language, many of these programs struggle with poor resources and difficulties arising from the dispersal of their speakers. In many cases they group native speakers with second language learners as a result of difficulty in making separate provision for the small numbers of

home language speakers of these languages, or because separate provision is considered unnecessary or divisive. Such mixed groups have been studied in Wales (Jones, 1991), Ireland (Hickey, 2001, 2007), Canada (Mougeon & Beniak, 1994), and in the Basque Autonomous Community (Zalbide & Cenoz, 2008). Where L2 learners and native speakers are mixed, research has identified deficiencies in the provision for native speakers, such as lack of language enrichment in input that is simplified for L2 learners, as well as insufficient promotion of the *use* of the language between mother tongue speakers of nondominant languages.

Developments and Challenges

Developments in this sector include expansion to offer provision in minority languages not previously supported, and new models, such as the Israeli one. Another ongoing development is in the area of plurilingual preschools, where instruction in a dominant international language is added, for example English in Basque-Spanish/French settings (Elorza & Munoa, 2008). While this may be attractive to parents who see greater economic or social value in the dominant language, it requires pedagogical and linguistic expertise from teachers, and adequate resourcing.

A continuing challenge in the sector concerns the difficulty in finding sufficiently fluent speakers of the target language who are trained in early years education. This contributes to the difficulty in providing differentiated input that adequately serves language learning by all children, whether mother tongue speakers of varying degrees of proficiency or second language learners. In some minority language preschools, volunteers with fluency in the language, including grandparents, are used as helpers to address the fluency gap. Another challenge is the need to develop teacher training to foster a more strategic approach to promoting target language *use* by children and the formation of strong peer networks through the language (Hickey, 2007). Mother tongue speakers of a minority language need some periods at least when they are deliberately grouped together for language enrichment activities, and to support target language use between children, to counteract a situation in which the local dominant language becomes the language of unofficial immersion in these groups.

Other ongoing challenges include difficulties in accessing appropriate materials for early years education in often under-resourced languages, and finding well-trained early years educators who are bilingual/multilingual, when their work is not adequately remunerated, since work with young children is often undervalued and assumed to require less skill. Only a fuller appreciation among other educators, parents, and educational planners of the value of providing high-quality, effective bilingual early education, in its varied forms and formats, will lead to the level of recognition and investment that this sector needs for optimal future development.

Early Bilingualism

ANNICK DE HOUWER

Early bilingualism arises when young children start to regularly hear two languages instead of just one. Children may hear these languages from birth, or they may start to hear a second language at a somewhat later age. In the first case, children are going through a process of bilingual first language acquisition or BFLA (Meisel, 1989; De Houwer, 1990, 2009). BFLA children have two first languages, namely Language A (LA) and Language Alpha ($L\alpha$), which typically are both spoken to them at home. This notation indicates that BFLA children have no chronologically first or second language. Children who are at first raised with just a single language (Language 1 or L1), and who start to regularly hear a second language (Language 2 or L2) at a later age are going through a process of early second language acquisition or ESLA (De Houwer, 1990, 2009). Typically, ESLA children hear only one language at home (L1), and meet the L2 in a group setting outside the home, such as a daycare center or a preschool. The L1 is usually a minority language.

This article first describes the major linguistic developments in BFLA and ESLA. After that, early bilingualism is considered from a more applied perspective. The focus is on bilingual children under the age of 6. These young children typically learn their two languages without the support of literacy or formal instruction.

The Major Linguistic Developments in BFLA and ESLA

BFLA children start to regularly hear two fundamentally different ways of speaking once they are born. Although it is not clear how exactly BFLA children learn to distinguish between their two languages, there is more and more evidence that they manage to do so in the first 7 months of life (Bosch & Sebastián-Gallés, 1997; Sundara, Polka, & Molnar, 2008).

By the time they are 1 year of age, BFLA children can understand several words in each of their languages (Leopold, 1939–49/1970; Cruz-Ferreira, 2006; De Houwer, Bornstein & De Coster, 2006). As is the case with monolingual children, there are great differences between BFLA children in how many words and phrases they understand (De Houwer et al., 2006). There are also differences in how many words BFLA children understand in each of their two languages.

Like monolingual children, BFLA children make language-like sounds in the first year of life, including sounds that resemble syllables. Longer repetitions of the same syllables (babbling) start to occur by the age of 7 to 9 months (e.g., “bababa gaga”; Ronjat, 1913; Leopold, 1939–49/1970; Cruz-Ferreira, 2006). For monolingual children it is unclear to what extent this babbling already reflects specific aspects of the one language they are hearing. For BFLA children, it is similarly unclear to what extent their babbling reflects characteristics typical of LA or $L\alpha$.

Around the first birthday, both monolingual and BFLA children start to make sounds that remind adults of specific words (Ronjat, 1913; Leopold, 1939–49/1970; Cruz-Ferreira, 2006). BFLA children do not necessarily start to say words in each of their two languages at the same time. In fact, there may be a time lag of several months between their saying a word in LA and in $L\alpha$ (see Box 6.16 in De Houwer, 2009, p. 218, for an overview).

Yet some BFLA children start to say words in each of their languages on the same day (De Houwer, 2009, p. 218).

Like monolingual children, BFLA children use word-like vocalizations in order to ask for things, comment on a state of affairs, draw someone's attention to a situation, and many more functions (Cruz-Ferreira, 2006). Both monolingual and BFLA same-aged children differ a lot from each other in the number of different words they can say (see Bates, Dale, & Thal, 1995, for monolingual children, and Conboy & Thal, 2006, for BFLA and ESLA children). In the second year of life, BFLA children who say a lot of different words in LA usually say a lot of different words in L α as well. Conversely, BFLA children who say few different words in LA also usually say few different words in L α (Conboy & Thal, 2006).

Children's pronunciation of early words is still quite immature, and can differ considerably from adult pronunciation. Like monolingual children, BFLA children may reverse sounds (e.g., 'puck' instead of 'cup'), may delete some sounds (e.g., 'uh' instead of 'Kuh', for German 'cow'), or may substitute sounds (e.g., 'heaby' instead of 'heavy'; Ronjat, 1913; Gut, 2000; Brulard & Carr, 2003). These phonological processes slowly give way to more adult-like pronunciations, but neither monolingual nor BFLA children sound completely adult-like by the time they are 6 (see the overview in De Houwer, 2009, Chapter 5).

Research into phonological development in BFLA children suggests that in many cases BFLA children develop two fairly separate phonological systems, but often it is hard to decide whether young BFLA children's sounds are used in a language-specific way or not. It may never be possible to fully know whether BFLA children's early phonological development is different for LA and for L α . One issue here is that, often, BFLA children may hear one of their languages only from a single speaker. In that case, the way that individual speaker pronounces a language may be a fundamental factor in how the child will be learning to pronounce that language (De Houwer, 2009, Chapter 5).

As BFLA children start to approach their second birthday, most of them will be combining two words into a single utterance (e.g., 'no eat', 'daddy door'; Leopold, 1939–49/1970; Patterson, 1998; Deuchar & Quay, 2000; Cruz-Ferreira, 2006). The use of word combinations is an important milestone in children's language development. After all, just using single words is very limiting in terms of the range of meanings that can be expressed. Combining words is the foundation for building sentences. Some children, whether monolingual or bilingual, produce two-word utterances for many months. Other children use two-word utterances for only a very short time, and soon move on to saying three- and four-word utterances.

Once children start to combine more than two words they are often saying real sentences. These sentences usually have a word order that is correct in the language they are using (e.g., 'put in there'), and they may contain grammatical words and inflections (e.g., 'where's the baby?'; 'mommy change sheets'; Sinka & Schelletter, 1998; Almgren & Barreña, 2000; Serratrice, 2001). BFLA children usually combine words and inflections from the same language into a single utterance. When all the words and inflections in an utterance are from the same language, BFLA children are using a unilingual utterance. If words or inflections from two different languages are combined into a single utterance, the utterance is mixed.

Most of BFLA children's multiword utterances are unilingual. There is, however, large variation between BFLA children in the relative number of mixed utterances they use (De Houwer, 2009). Some children do not use any, while others use up to 30% of mixed utterances in a single recording of, say, a one-hour interaction (no higher proportion has so far been reported). The proportion of mixed utterances also varies considerably over time within the same child. Most of young BFLA children's mixed multiword utterances are in one language, except for a single noun that has been inserted from the other language.

There have been various theoretical accounts to explain the use of other types of mixed utterances (see, e.g., Cantone, 2007).

The structure of unilingual utterances as said by BFLA children usually follows the rules of the language the words are in. That is, when a multiword utterance has words only from Language A, the word-order rules and the grammatical properties of LA will be used. The same goes for L α . The repeated finding of these facts for many different languages and many different language combinations (most recently reviewed in De Houwer, 2009, Appendix G) gives strong support for the Separate Development Hypothesis (De Houwer, 1990), which states that BFLA children develop two distinct morphosyntactic systems. Unilingual utterances as produced by BFLA children could in most cases have been said by monolingual children acquiring each of a BFLA child's two languages as their only one.

BFLA children may say unilingual utterances in each of their two languages. An estimated quarter of BFLA children, however, do not say unilingual utterances in each of their two languages, but only in one (De Houwer, 2007; whether these children generally use mixed utterances is not known). It is clear, then, that hearing two languages from birth is not a guarantee for actually speaking two languages. This differs from the monolingual setting, where children who have no hearing problems or suffer from neurological disorders all learn to speak the one language they are hearing.

As BFLA children grow into the preschool years, they continue to expand their vocabulary, improve their pronunciation, and expand the diversity and complexity of grammatical structures. They also learn to tell connected stories. BFLA children's language use in each of their languages closely resembles that of the adults who speak these languages to them. As is the case for monolingual children, though, young BFLA children's language use is still a fairly limited version of what adults are capable of. As for monolingual children, this gradually changes as they get older.

ESLA children's language development appears to be more variable than that of BFLA children. This is to be expected, given the different ages at which ESLA children start to learn their L2 and the different circumstances in which they learn their L2. Most studies of ESLA focus on children's L2 development rather than their L1 and concern children who first started to learn their L2 after age 3. Until they start to speak an L2, ESLA children's L1 language use resembles that of monolingual and BFLA children. Once ESLA children have achieved fluency in their L2, their L1 speaking skills may continue to develop, decline, or disappear altogether (Shin, 2005). How these differences in L1 use may affect development in the L2 is not known.

The studies of L2 development in children under age 6 so far suggest that on average it takes children at least 2 years of exposure to the L2 in an immersion-type school setting to start to be able to say non-imitated sentences in the new language (for an overview, see Genesee, Paradis, & Crago, 2004, Chapter 6). This runs counter to the common assumption that ESLA children learn their second language very fast. Instead, many ESLA children first go through a period in which they are just trying to make sense of what is going on in the L2 spoken around them, without attempting to speak it themselves. This is followed by first attempts to speak the L2 in formulaic utterances and single words. Gradually, the formulas are expanded into more varied sentences.

Like monolingual and BFLA children at an earlier age, ESLA children make mistakes when they start to build sentences that are not imitations. These mistakes often arise because a particular grammatical feature such as a plural -s ending in English was not pronounced. Children may also use incorrect grammatical features. These errors are comparable to the ones younger monolingual and BFLA children make in acquiring the same language. In addition, there are different kinds of errors that show a clear influence from the ESLA child's L1. On the grammatical level, the most common errors showing influence

from the L1 are word-order errors (Genesee et al., 2004). Many young ESLA children's early L2 utterances do not sound like those that monolingual children would say (but many others do). Yet, as time goes on, ESLA children may become indistinguishable from monolingual children.

A recent volume on phonological development in young ESLA children (Hua & Dodd, 2006) suggests that their development of a second language phonology may be influenced by their L1 as well. Thus, different patterns exist for different language combinations. Once again, there is a large degree of interindividual variation.

This finding of great interindividual variation is also apparent in ESLA children's lexical knowledge. Some children will know many words in both languages, others far more in one. Also, ESLA children may be able to discuss a particular topic only in one language. In BFLA children such specializations may occur as well. Although both BFLA and ESLA children will generally know more words in both their languages combined than monolingual children, ESLA children will generally have smaller receptive vocabularies in the school language than age-matched monolinguals (Bialystok, Luk, Peets, & Yang, 2009). When BFLA and ESLA children actually speak two languages, they may speak those languages at quite different levels. They may be much more fluent in one language than in the other, and know more words in one than in the other. Then again, with changing circumstances, the balance may change. There are also bilingual children who seem to speak each of their languages equally well.

Like BFLA children, ESLA children may produce mixed utterances. These have similar structures in both BFLA and ESLA children. Young bilingual children easily switch between unilingual utterances in LA or L1, unilingual utterances in L α or L2, and mixed utterances. Their switching is influenced by sociolinguistic factors, such as the language use of the interlocutor, the expectations of the interlocutor, the place of interaction, the topic, and so on (see, e.g., De Houwer, 1990; Lanza, 1997; Deuchar & Quay, 2000). Both in the fact that they easily switch, and in the fact that they usually switch for clear sociolinguistic reasons, bilingual children resemble bilingual adults right from the start.

Applied Aspects of Early Bilingualism

Many bilingual children live in an environment that fosters their active and proficient use of two languages. Yet many others are not that lucky. They may understand two languages, but speak only one, much to their own chagrin or that of their family members, or they may speak two languages in ways that are unsatisfactory to their environment. In addition, frictions may arise in bilingual families that are attributed to the fact of bilingualism. Often, parents, teachers, and speech therapists expect child bilinguals to function at least as well as monolinguals in each of their languages. There is also a pervasive myth that young bilingual children are confused and cannot get their languages straight. This myth persists in large portions of society but the scientific evidence shows it to be what it is—an unfounded myth. As the overview in the first section of this entry has shown, young BFLA children can speak each of their languages without noticeable systematic influence from the other, and many ESLA children can learn to speak their L2 very well indeed.

Another persistent myth is the idea that children can learn a second language very fast. While some young children who are confronted with another language may indeed soon be able to say a few well-chosen words and phrases in that language, and may be able to effectively take part in informal conversations, it usually takes several years for ESLA children to master a language, just as it does in monolingual and BFLA children, who, however, have had the benefit of hearing their languages since birth. Learning to speak like a 6-year-old takes a 6-year-old monolingual child six years of practice and taking advantage of learning opportunities. ESLA children under the age of 6 may develop their

new language at a rate that is faster than for monolingual and BFLA children when they first start to speak, but the current evidence suggests that it still takes at least a year or two after initial regular contact with an L2 for young ESLA children to become fluent conversational partners (however, there is wide variation between young ESLA children in the speed with which they learn to speak their new language; see also Meisel, 2009; De Houwer, 2011).

Simply put, bilingual children need the time and opportunity to learn their two languages. For parents in a bilingual setting this simple fact means that they should talk to their children as much as possible. If parents use two languages at home, they should make sure to talk a great deal to their children in both. If parents speak one language at home, and the second language is used outside the home, the home language should be spoken very frequently. As children start to go to school, parents should try to expand their vocabulary in the home language, so that it remains an important vehicle for communication, and children get the chance to continue to develop in their L1. For teachers and speech therapists alike, the realization that bilingual children need the time and opportunity to learn their L2 will hopefully avoid a common reaction to ESLA children's initial silence at school, which is to see it as a sign of a language disorder (e.g., Shin, 2005). This silent period is in fact a normal, common feature of the L2 learning process: Children have to get used to the new language, and must learn to understand it. This takes time.

Many (preschool) teachers and speech therapists are concerned about early bilingualism, and want children to learn the school language well. They often believe that early bilingualism is an impediment to learning the school language (Shin, 2005; Genesee et al., 2004; De Houwer, 2009). In fact, many pediatricians, parents, and scholars have the idea that early bilingualism is just not possible, or only possible for exceedingly smart children. Yet the existence of many proficient bilingual children is the best proof that early bilingualism certainly is possible.

Still, negative attitudes toward early bilingualism persist. If there are any problems in a child's bilingual development, it is these negative attitudes that frequently are to blame (Shin, 2005; De Houwer, 2009). One particularly strong and detrimental effect of these negative attitudes is the frequent advice of teachers, speech therapists, and doctors to parents to stop speaking the minority language to their children. Parents often take this ill-conceived advice, with quite negative results: They can in many cases no longer communicate well with their children (since they may be switching to a language they hardly know), and the children are bewildered and upset that their parent all of a sudden speaks another language to them; many children see this as putting an undesirable distance between the parent and themselves, and find it hard to bear. On the other hand, in cases where children have problems communicating in either language, medical personnel often place the blame with a bilingual family environment, and may advise to stop talking the minority language at home, without addressing what later may surface as the real underlying problem, for instance, deafness.

The common "professional" advice to give up speaking a particular language to a child appears to assume that having less input in a language will increase knowledge of another language. There is absolutely no evidence to this effect. More seriously, this advice is morally and legally unacceptable. It goes against the United Nations Convention on the Rights of the Child, which states in Article 29, division (c), that the States parties to the Convention agree that the education of the child shall be directed to

the development of respect for the child's parents, his or her own cultural identity, language and values, for the national values of the country in which the child is living, the country from which he or she may originate, and for civilizations different from his or her own. (United Nations, 1989)

In families that stop speaking the minority language, children will effectively become monolingual. As indicated in the previous section, many children with continued and regular bilingual input will end up speaking only one language (while often understanding two). Families will thus develop conversational patterns where parents address children in L1 and children respond in L2. In some cases, it may be no problem that the child speaks only one language. Many interviews with parents of such children and many reports in the literature (e.g., Shin, 2005), however, suggest that usually it does become quite a problem for the parents in these bilingual families that their children do not speak the minority, home language. In many cases, this effectively limits the communication between parents and children, and the transmission of many cultural values. Often, also, as children grow up, they are very sorry not to be able to communicate with members of their extended family, and not to be able to function in the country where the language they do not speak is being used.

The question is why so many children growing up in bilingual circumstances speak only one language instead of the expected two. In a survey of ca. 2,500 bilingual families in Flanders, connections were traced between parental language use and child use of the minority language. Those bilingual families where children spoke only a single language tended to be families where both parents used the majority language at home, and only one parent used the minority language. Parents who both spoke the majority as well as the minority language at home and parents who both spoke the minority language at home, with one parent in addition using the majority language, had much better chances of having children who spoke the two languages (De Houwer, 2007). Parents who only used the minority language at home had the most chance of having children who spoke two languages.

Several contributing elements can explain these findings but the most important one may be related to frequency of input: If only one parent speaks the minority language, but in addition that same parent also speaks the majority language, there may be less input in the minority language than in families where both parents speak the minority language (in addition to one or both also speaking the majority language). Second, families where both parents speak the minority language at home may create much more of an environment conducive to using that minority language. After all, the family already has two members speaking that language rather than just one. Parents may also be more inclined to speak the minority language with each other.

Another important factor contributing to whether bilingual children speak two languages or just one has to do with the communicative need to speak two languages rather than just one. If there is no communicative need to speak two languages, bilingual children will not do so. This communicative need is created in conversation. Some bilingual parents do not mind if their child speaks only one language at the beginning of speech. They are just happy that their infant can talk, and will respond to the child's utterances without focusing on the actual language the child used. They may answer a child's question in Italian with a response in German, if that is the language they usually use with their infant. These parents are using what Lanza (1997) has termed "bilingual discourse strategies"—conversational patterns that allow the use of two languages within a conversation. Other bilingual parents may be much less tolerant of the use of two languages within a conversation, and socialize the child into using mainly one language within a stretch of discourse. These bilingual parents use what is termed "monolingual discourse strategies" (Lanza, 1997). Although so far there have not been enough studies documenting these discourse strategies and their possible effect on children's language use, it is very likely that, if parents use mainly bilingual discourse strategies and allow the child's use of "the other" language (L_x), children have no need for speaking LA and will become part of that large group of children raised bilingually who understand two languages but speak only one.

The importance of communicative need is also a factor in ESLA. When children hear a new L2 at preschool but have friends there they can speak their L1 with, they will feel less of a communicative need to actually speak the new L2, and may be slower in developing any fluency in the L2. Becoming friends with children who speak the L2 will foster an ESLA child's L2 development.

There are many more important matters to mention about early bilingualism. The most important point, however, is that bilingual children need the time and the opportunity to learn to speak each of their languages. Given that, and a positive attitude from all involved toward the bilingual language-learning experience, children everywhere can become fluent speakers of two languages from early on.

Ecological Approaches in Qualitative Research

RACHEL J. PINNOW

Introduction

When the term *ecology* first began to appear in applied linguistics research in the early 1990s it was referred to as the “greening” (de Castell, 1996) of these studies which followed a general trend in the “ecoization” (Benz, 2000) of the English lexicon. Today, the “greening” of applied linguistics research reflects both the growing awareness of the vital interrelatedness of language, language users, and environment as well as a pivotal shift away from prior mechanistic models of language acquisition and socialization (Kramsch, 2002). Ecology as both a metaphor and research paradigm serves to contribute to our understanding of the diversity of linguistic ecologies, the elements that preserve these ecologies, and the interplay of broader sociocultural factors that affect language education research worldwide.

Ecological approaches to applied linguistics research have evolved to address a multiplicity of perspectives for research exploring language in *context*. In this vein, qualitative methodological approaches are particularly well suited to ecological research as they view humans as *participants* in language use, shift, loss, and preservation rather than as subjects to be acted upon (a point well addressed in ecological approaches to language planning and policy). In the following sections the historic emergence of ecological research will be explored along with the main trends in ecological approaches to qualitative research in applied linguistics.

Emergence of Ecological Theory

Ecology, as a biological field of study, was introduced in the 19th century by German biologist Ernst Haeckel in order “to refer to the totality of relationships of an organism with all other organisms with which it comes into contact” (van Lier, 2004, p. 3). In the 1960s the term “ecology” entered the mainstream lexicon through the publication of Rachel Carson’s *Silent Spring* (1962) which addressed the relationship and repercussions of human life and the biological environment. It was this focus on relations, interactions, endangerment, and diversity that invoked a metaphorical response in other fields of study such as anthropology, sociology, psychology, and linguistics.

In anthropology, Bateson (1972) popularized the term through his approach to the evolution of human mind and Ogbu (Ogbu & Simons, 1998) applied an ecologic framework to address academic achievement in schools. In sociology, researchers had already begun to connect the role of language in ecological behavior such as ethnic group membership as early as the 1940s and 1950s (Hollingshead, 1947; Hawley, 1950). In psychology, Bronfenbrenner (1989) and Gibson (1977, 1979) heavily shaped ecological theory. Bronfenbrenner (1989) posited a formal theory, *ecological systems theory*, which encompassed psychological, social, biological, cultural, and identity structures in human development. Gibson (1977, 1979) put forth an ecological theory of visual perception ultimately engendering the entire academic field of ecological psychology. Gibson’s (1979) notion of *affordance* is a central tenet

to an ecological approach in research and reflects his functionalist perspective on the nature of the acquisition of knowledge while differing profoundly from traditional structuralism. Viewing humans and environment as linked, but not in a mechanistic fashion, Gibson defined the concept of affordance stating “the affordances of the environment are what it offers the animal, what it provides or furnishes, either for good or ill” (1979, p. 127). The emphasis on the emergent properties of affordance, between learner and environment, was introduced into educational linguistics by van Lier who cast these concepts within a broader semiotic perspective positing, “perhaps affordances can best be seen as ‘pre-signs’ that is, they may be the fuel that get sign-making going” (2004, p. 93).

While Gibson’s (1979) approach to visual perception provided much needed theoretical perspective on the nature and acquisition of knowledge, linguist Einer Haugen (1972) provided a more direct link to language within an ecological perspective. Haugen provoked much research in applied linguistics when he posited the term *ecology of language* (1972, p. 328) in an effort to address the poverty of representation apparent in much linguistic research of that time. While Haugen was not the first to associate biological metaphor with language (see Voegelin, Voegelin, & Schutz, 1967), his ideas were a powerful impetus for linguistic researchers seeking to address the interplay of language, language user, and environment.

Haugen (1972) defined language ecology as “the study of interaction between any given language and its environment” (p. 325) claiming that languages have life, purpose, and form that appear outwardly as action but “live in the mind as potential” (p. 327) and therefore the life of language should be treated as dynamic and interdisciplinary. It has been this interdisciplinary quality that has proven to be fruitful for applied linguistics research in that the ecology of language is partly psychological, partly sociological and shaped by users (Haugen, 1972).

The two main trends in applied linguistics research that have emerged from Haugen’s (1972) original work are ecolinguistics and ecology of language approaches. The histories of these two approaches are deeply intertwined (Lechevrel, 2009) with ecolinguistics examining language and environment from a linguistic perspective and ecology of language approaches taking a broader sociocultural perspective.

Ecology of Language Research

Ecolinguistics emerged in the early 1990s as the study of “linguistic diversity and the interrelations between language and world from an ecological point of view” (Fill, 2002). Informed by the linguistic perspective of Haugen (1972) and the anthropological perspective of Sapir (1912), ecolinguistics traverses a continuum along which some linguists approach the study of language from an ecological perspective, while others examine ecological and environment problems from a linguistic perspective.

Ecolinguistic research has often relied upon action research methodology, case study methodology, ethnographic methodology, and discourse analytic approaches in order to address language preservation, endangerment, and linguistic ecologies (Fill & Mühlhäusler, 2001). Along this continuum is research in dialectical linguistics, an ecolinguistic approach that promotes politically and morally responsible approaches to language and linguistics research (Bang, Døør, Steffensen, & Nash, 2007).

Ecology of Language Research

Ecology of language studies employ “ecology” as both metaphor and paradigm in order to provide a conceptual framework for exploring the complex nature of language research

in shifting contexts. These studies emphasize the dynamic, complex, dialectical, and inter-relatedness of language interactions in multilingual and multicultural contexts. Most importantly, this research clearly addresses the role of an ecological perspective in unmasking hidden ideologies and critiquing the norms and values that normalize power structures in various contexts.

In educational contexts, one primary focus has been in language education research with qualitative approaches addressing literacy and literacy practices that encompass the multiple ecologies of language learners (Barton, Drake, Perez, St. Louis, & George, 2004; Villalva, 2006; Pantaleo, 2009). This research takes an ecological perspective on literacy recognizing that “literacy” is ideological and highly interdependent with social ecologies from which it evolves. Due to this, recent research has found sociocultural theory useful in providing insight to the link between ecological psychology approaches and the specific affordances of language in context (van Lier, 2004).

Building upon an ecological perspective of literacy is research by Hornberger (2003) that approaches literacy and bilingualism as joint and highly compatible ventures in language education. In this vein of research an ecological perspective provides the framework for addressing multilingualism as a resource, rather than a problem, in the complex process of language acquisition. This point is of vital significance as “only a minority of the world’s children acquire language in an environment that is monolingual” (Leather & Van Dam, 2003, p. 2). This research extends beyond the basic taxonomic structure of Haugen’s (1972) original work to address the complexities of language acquisition to produce contextually relevant interpretations of acquisition data. Ethnographic and discourse analytic approaches abound in this strand of research in order to provide an emic perspective of the complex interplay of language in context.

Further ecological approaches to multilingualism, which continue to help dismantle English-centric and Western-centric approaches to language research, take into account the dynamic interplay of histories, cultures, economies, and languages of multilingual societies including shifts in discourse, literacy, and educational practices of these societies (Creese, Martin, & Hornberger, 2008). These studies emphasize the multicultural and multilingual history of various countries, powerfully countering erroneous claims that have traditionally posited monolingual and monocultural perspectives as central to the language acquisition and learning process.

Other research examines the language ecologies of diasporic communities (Creese et al., 2008). Many of these studies have found a link between the changing linguistic ecologies of various nations and sedentism, especially on the part of indigenous peoples. The fact that sedentism can greatly affect the socioeconomic status of various people groups (usually in a downward trend) and lead to the divestment of cultural traditions, rituals, and practices is troublesome and should be exploited in the controversy over the appropriateness of the ecological metaphor in applied linguistics research.

Recent research in multilingualism links broader sociopolitical agendas and discourse with classroom literacy practices (Creese et al., 2008) while other strands in ecology of language research attend to multiliteracies and the multimodal demands of literacy (Jewitt & Kress, 2003; Pahl, 2008; Berglund, 2009). These strands of research in applied linguistics take as their starting point the notion of literacies as multiple, dynamic, and interrelated to languages, language users, and environment. Moreover, qualitative approaches to multimodal research have provided innovative analytic methodology that take into account the multiple semiotic resources employed in discourse and metadiscourse in society and culture (Jewitt, 2009).

Conclusion

The aim of this entry has been to offer a view into the development of ecological approaches to qualitative research in applied linguistics. By examining the various strands of scholarly traditions that have contributed to our current approaches to ecological research it is possible to gain insight into how this research currently contributes to important shifts in applied linguistics research. As Fettes (2003) has stated, “ecological thinking does not come readily or unproblematically to us moderns” (p. 31). For this reason, as with the ecological crisis that we now face, continuing to establish a research paradigm that fully addresses the interrelatedness of languages, language users, and environment is crucial.

Ecology and Multilingual Education

FRANCIS M. HULT

The *ecology of language* has its foundation in the work of sociolinguists and linguistic anthropologists in the late 1950s and early 1960s (e.g., Trim, 1959; Voegelin & Voegelin, 1964), but it was Einar Haugen (1972) who popularized the concept with his work in the 1970s. In the late 20th century, the ecology of language, sometimes known as “ecolinguistics” or “language ecology” (Makkai, 1993; Fill & Mühlhäusler, 2001), has become an umbrella term for a wide range of perspectives that seek to make connections between language and environment: using concepts related to ecology to understand social environments for multilingualism, analyzing discourses of environment and environmentalism, and describing relationships between biological and cultural diversity (Fill & Mühlhäusler, 2001).

While each of these perspectives is useful in its own way for understanding aspects of language in society, and all of them overlap in meaningful ways, the focus here will be on the first perspective since it is arguably the most widely used with respect to the study of language (in) education. In this regard, the ecology of language is a conceptual orientation to critical thinking about multilingualism that calls upon researchers to focus “on relationships among languages, on relationships among social contexts of language, on relationships among individual speakers and their languages, and on inter-relationships among these three dimensions” (Hornberger & Hult, 2008, p. 285). Thus, a distinctive feature of language ecology is its focus on the interplay between sociological and psychological aspects of multilingualism (Haugen, 1972, p. 352).

As a perspective on social environments for multilingualism, language ecology serves to highlight how different languages interact at individual and societal scales, with an eye toward relationships between them (Hornberger & Hult, 2008; Kramsch & Whiteside, 2008; Hult, 2010). It is not a prescribed methodology for (socio)linguistic analysis but a way of approaching the study of multilingual situations that might be facilitated by a wide range of methods from linguistic ethnography, (critical) discourse analysis, documentary linguistics, and linguistic landscape analysis, among others. Regardless of the methodology employed to execute a particular study, researchers following an ecological orientation tend to share a view of multilingualism as a dynamic and multilayered phenomenon such that one cannot study a single language in isolation but must always seek relationships among different languages and their speakers across varying scales of social organization (Haugen, 1972; Mühlhäusler, 2003). Considering the epistemological roots of language ecology, those working under its rubric have this perspective in common with many sociolinguists and linguistic anthropologists more broadly.

With respect to social environments, fundamental to an ecological orientation is the idea that all languages are interconnected in a worldwide sociolinguistic system (Calvet, 1999). Calvet (1999, p. 35) suggests that it is useful to see the worldwide system as a linguistic *ecosphere* that is composed of a series of nested linguistic *ecosystems* on varying scales, ranging from social groups to classrooms to schools to cities to regions to countries and beyond. Within and across these ecosystems, different languages occupy specific functional *niches* in relation to each other. A central project among researchers who work within this orientation is to understand the social, political, economic, and historical factors that influence those niches, especially with respect to the promotion of linguistic diversity through additive language education (Skutnabb-Kangas, 2000, pp. 365–78).

Controversies and Debates

Several epistemological controversies have arisen around the ecology of language. These tend to relate to three major themes underpinning the ecological orientation: language evolution, language environment, and language endangerment (Hornberger 2002, p. 33). Fundamental to an ecological view is that languages change and develop in social contexts, mediated by the language choices and beliefs of individual speakers (Mufwene, 2001). Assumptions associated with this perspective have come under attack from several different perspectives.

With respect to language evolution, some critics argue that it is problematic to rely heavily upon notions of biological evolution since this runs the risk of overemphasizing a “survival of the fittest” mentality that obscures the role of human agency in language vitality and change (Edwards, 2002; Pennycook, 2004). In contrast, Mufwene (2001) holds that drawing upon principles of evolution does not preclude a focus on human agency. Rather, he contends, language can be seen as evolving symbiotically with human societies and cultures, including the conflicts and power inequities that are inherent in them.

The role of human agency is central to the language endangerment theme because researchers who work within the language ecology approach are often concerned with teasing out the factors that engender conflicts so they can be resolved through language policy and education in ways that foster harmonious coexistence among different languages (Phillipson & Skutnabb-Kangas, 1996). This goal for linguistic harmony, in response to language endangerment, is perceived by some as naive and as an indication that the ecology of language may be more about sociopolitics than linguistic science (Pennycook, 2004, p. 222; Edwards, 2008, pp. 17–20). In contrast, those who follow an ecological orientation view sociopolitics and linguistic science as intimately intertwined (Skutnabb-Kangas, 2000; Hornberger, 2002; Mühlhäusler, 2003).

The language environment theme has also received criticism, particularly around the issue of whether ecology is best applied to multilingualism metaphorically or seen as an actual state of affairs in the social world (Edwards, 2002, pp. 308–10). Those who are skeptical of language ecology have reservations about an organismal view of languages and relationships among them, with some even beginning to question the very nature of discrete languages and the concept of linguistic diversity itself (Pennycook, 2004; Makoni & Pennycook, 2007). A number of scholars working in language ecology, on the other hand, hold that languages are in very real ecological relationships (Mühlhäusler, 2003; Garner, 2004). As Garner puts it, “language is an essential aspect of the part we humans play in the ecology of our planet. It forms a part of the environment, in a complex but quite literal sense” (2004, p. 33). This view is especially prominent among proponents of the concept of biocultural diversity, who see a strong link between biological and linguistic diversity (e.g., Maffi, 2001).

Whether language ecology is taken literally or metaphorically, those who use it in their work share a view, along with many other (applied) linguists, that multilingualism is a normal condition in human societies and that inequitable relationships among languages need to be understood and addressed in order to foster parity for all people in a polity, regardless of the language(s) they speak, particularly with respect to education.

Contributions of Language Ecology

An ecological perspective calls attention to the fact that languages are situated in social environments. As such, the role of languages in education together with relationships between education and society are central considerations. As Mühlhäusler explains:

Language teaching involves the introduction of a new language into an existing language ecology. There may be good reasons for doing this, and there are also good reasons for devoting much energy to the question [of] how newly introduced languages can be strengthened. However, it is equally important to pay attention to the affects [sic] of such an action on the wider linguistic ecology, and how this introduction affects the other languages, their speakers and their well-being. (1994, pp. 122–3)

Accordingly, from the point of view of language teaching, the ecology of language highlights the importance of being aware of the social and political environment in which language learning and teaching takes place. This includes, as noted earlier, paying attention to how language education relates to large-scale linguistic ecosystems like regions, countries, and cities as well as to small scales like communities, schools, classrooms, and interpersonal interactions.

The ecological impact of dominant languages on linguistic diversity has been a particularly salient issue. Skutnabb-Kangas, for example, advocates for an awareness of linguistic genocide in education, the process of killing a language either actively by preventing speakers (through force or violence) from using their languages or passively by enacting policies and educational practices that limit the resources and opportunities for minority languages in schools (Skutnabb-Kangas, 2000, pp. 318–74). In this vein, the study of educational language policies has been a focal area, particularly with respect to their role in restricting or expanding implementational spaces for different languages in educational domains (Hornberger, 2005) and with an eye toward how policies operate across varying scales of social organization (Hornberger & Hult, 2008; Hult, 2010). On an individual level, Nathan (2008) suggests that every person should reduce their *language footprint* by learning/using local languages rather than dominant world languages as much as possible when traversing linguistic ecosystems.

With respect to making connections across scales of social organization, an influential framework that has been used to guide ecological studies of multilingualism in education is Hornberger's (1989) continua of biliteracy. The 12 sets of continua that comprise this framework bring to light how different languages are situated relative to each other with respect to the context of biliteracy, development of biliteracy, content of biliteracy, and media of biliteracy. In terms of the ecological impact of dominant languages on minority languages, research using the continua of biliteracy shows that there is a tendency for educational systems to privilege monolingual, literate, and majority language practices and that additive language education requires creative ways of integrating minority languages in classrooms (Hornberger & Skilton-Sylvester, 2000; for a collection of studies that draw upon the continua see Hornberger, 2003).

Turning specifically to the classroom, language ecology also calls attention to how students learn and acquire language through interaction with teachers and peers. Classrooms are seen as simultaneously physical, social, and symbolic environments in which students' mental processes emerge in conjunction with opportunities to co-construct meaning using new forms and functions of language (van Lier, 2008). Work in this area of educational language ecology has focused on learners and the nature of language acquisition itself (e.g., Leather & van Dam, 2003) as well as on classrooms as spaces where individuals encounter diverse linguistic practices and ideologies (Creese & Martin, 2003).

More broadly, language ecology highlights the potential implications of different social settings as contexts for language teaching and learning. A long held dichotomy in language teaching is that of foreign- *versus* second-language settings. Work in this area considers the practicalities of language teaching and learning as it pertains to opportunities for encountering and using the target language outside of the classroom, benefits and challenges with respect to helping students develop linguistic and sociolinguistic competence,

the styles and registers that students need to acquire for intercultural communication locally or internationally, and even the tensions inherent in making a distinction between foreign- and second-language settings (e.g., Kramsch, 1993; Nayar, 1997; Tarnopolsky, 2008).

A substantial body of work in a range of theoretical and methodological traditions delves into different dimensions of the sociolinguistic settings in which language learning takes place. Linguistic landscape analysis, for example, is increasingly being used as a pedagogical tool for gaining insight into how students engage with multilingualism in physical environments (e.g., Dagenais, Moore, Sabatier, Lamarre, & Armand, 2009; Sayer, 2010). Current approaches to discourse studies highlight how learners gain socially situated language skills that facilitate their symbolic competence for the purpose of performing specific identities in particular social environments (Kramsch, 2002; Kramsch & Whiteside, 2008), while ethnographic and sociological work in the area of educational language policy illuminates ideological environments in which teaching and learning are situated (Hornberger, 2002).

Future Directions

Beginning in the 1990s, complexity theory began to emerge slowly in the field of (applied) linguistics (Hodge, 1990; Larsen-Freeman, 1997) as a way to begin to discuss relationships between small-scale and large-scale language behaviors. Complexity is becoming increasingly mainstream in language teaching and learning research, most notably with Larsen-Freeman and Cameron's (2008) book *Complex Systems and Applied Linguistics*, which sets out a number of core principles of complexity and how they might inform applied linguistic research. Chief among these core principles is a focus on a continuum of social scales ranging, for example, from individual students and teachers to lessons to classrooms to schools to national curricula (Larsen-Freeman & Cameron, 2008, pp. 201–2). A key aim of complexity-oriented research is to seek recurring (fractal) patterns across such scales in order to understand how they serve to mutually constitute one another as well as to ascertain how individuals navigate across them (Hodge, 1990).

This focus on scales of social organization echoes the ecology of language orientation to societal multilingualism as composed of a series of nested and interrelated linguistic ecosystems that are socially constructed by individual speakers (Calvet, 1999). Accordingly, the turn toward complexity in applied linguistics stands to have a fruitful and symbiotic relationship with language ecology in future research. Connections between complexity and language ecology are already beginning to be made in work that seeks to examine individual actions and choices within the context of dynamic and multilayered social systems. Kramsch and Whiteside (2008), for instance, have done so in elucidating how learners develop the ability to use language to situate themselves and others in particular subject positions and social realities, and Hult (2010) puts forward an approach to using methodological advances in discourse studies to investigate connections between individual social actions and sociopolitical forces in language policy systems.

In all, over the last 50 years, language ecology has remained a consistently useful conceptual orientation that has kept pace with trends in sociolinguistic research and proven flexible in its applicability to work conducted from a wide range of methodological traditions. As applied linguistics in the 21st century continues its focus on societal multilingualism, the ecological orientation is likely to maintain a consistent influence.

Economic Analysis of Language Policy and Planning

FRANÇOIS GRIN

Positioning the Approach

The economic analysis of language policy and planning (LPP) offers a systematic approach to the selection, design, and evaluation (whether *ex ante* or *ex post*) of LPP measures. It can be applied to issues as varied as the protection and promotion of minority languages; language education policy in multilingual countries; communication in multilingual political organizations such as the European Union; the language implications of immigrant integration; or the debate over the proper role of languages of wider communication.

In order to understand the nature and contribution of this approach, it is useful to recall the disciplinary origins of LPP, which are mostly found in three areas: first, the language sciences, with a solid tradition straddling sociolinguistics and the sociology of language (e.g., Ricento, 2006); second, law, with a particular emphasis on the notion of language rights; third, political science (e.g., Laponce, 2006), with contributions in normative political theory, where the emphasis is placed on the application to LPP of concepts developed in theories of justice (Kymlicka & Patten, 2003) and contributions in rational choice theory (Pool, 1991), which holds that actors are rational (meaning that they normally try to make the best use of their scarce resources), and that a similar criterion ought to be applied to the choice between alternative policy options.

This last approach is used in *policy analysis*, which provides a framework for comparing options and rules for choosing one (Grin, 2003). Policy analysis is usually anchored in political science, but many of its core concepts are imported from economics, and it is largely through the conduit of policy analysis that economic analyses can be brought to bear on language questions. Economics can also be applied to language without explicit reference to LPP, for example when estimating the rates of return of the investment in foreign language learning. In addition, some authors have stressed the embeddedness of LPP in the economic context (e.g., Lo Bianco, 1988). This type of knowledge can serve to inform policy choices by shedding light on some of their consequences. In this entry, however, we focus on the use of economics in explicit LPP choices, through policy analysis, which also provides a framework for including concepts and results from the various disciplines mentioned above.

Key Principles of Economic LPP Assessment

LPP as Public Policy

The term “policy” is sometimes used rather liberally to denote almost any type of language-related decision made by any type of organization, including private sector companies. In this entry, however, we use the more usual—and more restrictive—definition, in which LPP is conducted by official bodies or their surrogates—that is, directly or indirectly, by the state or by a group of states. It may, of course, carry implications for, or impose behavior

on, individuals and the private sector (as in the case of labeling requirements with which firms must comply).

This raises the question of why the state should get involved at all, since many areas of human endeavor are arguably best left to the initiative of the private market. The answer is that although this works reasonably well, on balance, in the case of most “private” goods and services (from apples to car insurance), it does not work so well in the case of goods and services that present some collective characteristics, which prevent markets from operating efficiently. Thus, the unregulated language dynamics resulting from the uncoordinated learning and use of language(s) by billions of social actors (a linguistic “free market,” as it were) typically generate outcomes like the spread of stronger languages and the decline or even elimination of others. If such outcomes are regarded as undesirable, this situation can be described, in analytical terms, as a case of *market failure*. Thus, as soon as *another* outcome is deemed socially preferable, it is perfectly justified, in the very logic of economic analysis, to entrust the state with the task of developing and implementing language policies (Grin, 2003).

It follows that the economic analysis of LPP is, obviously, not meant to dictate policy choices. Its task, rather, is to contribute to democratic debate by spelling out the consequences of pursuing various courses of action, from *laissez-faire* to more or less extensive policy intervention.

Comparison and the Counterfactual

As the above suggests, comparison is central to the whole approach. Fundamentally, economic analysis serves to compare competing options in a synthetic yet systematic fashion, taking their respective implications into account in the form of “costs” and “benefits,” and then choosing the option that promises to yield the highest “net value” (benefits minus costs). A particularly delicate point is that of properly identifying the terms of comparison, or the *counterfactual*, of a course of a policy. Suppose for example that the authorities are contemplating measures to protect and promote a threatened language. The policy typically carries a certain monetary cost. The alternative, however, is not merely “doing nothing” and saving money; it also carries other consequences, some of them adverse, that will arise in the absence of the policy. The threatened language may drop out of use for lack of support, with concomitant disruption of social, cultural, and economic life in the corresponding language community, as well as loss of aggregate linguistic diversity. On balance, the *counterfactual* to the policy may thus turn out to be more expensive than initially assumed, which is why a full identification of the counterfactual is crucial.

Market and Nonmarket Value

When computing the costs and benefits of language policies, it is important not to confine them to narrow monetary effects, whether positive (benefits) or negative (costs). Economics is a framework for making choices, which carry consequences of all kinds. When a decision is made, it must be because, all things considered, it appears likely to generate the highest net value, *taking account* of nonmonetary effects. The latter are often called “nonmarket” effects, because they are not (or only very indirectly) observable through market prices. Here again, a prime example is environmental quality: it cannot be bought and sold on a market, yet it represents a perfectly relevant dimension of the choice between, say, two different policy plans for the use of a tract of land adjacent to a growing city. While market effects can be inferred from observable prices, estimating the value of nonmarket effects is trickier. Some techniques developed in environmental economics (particularly contingent valuation) could be adapted in the future to the assessment of the respective nonmarket benefits and costs of alternative *linguistic environments*.

Private and Social Value

The relative value of alternative options looks quite different depending on the level at which the analysis is carried out. What is best for individuals taken one by one may not be best for individuals as members of a group. This is particularly evident for second or foreign language learning. The rates of return on second language skills usually make the learning of one dominant language more profitable from the point of view of individual actors. Hence, simply encouraging the learning of this language would *prima facie* look like good policy. But this policy choice, by reinforcing a hierarchy of languages, may end up downgrading the status of all the other languages, thus ultimately eroding the relevance of the linguistic capital of the native speakers of the *nondominant* languages, and hence reduce their well-being. The learning of the dominant language needs accompanying measures to curb such negative effects, lest what looked at first like good policy turn out to be bad policy. This paradox proceeds from the network aspects of language, whose implication is that the sum of (individual) effects is not equal to the aggregate effect.

Efficiency and Fairness

A good policy is not only supposed to deliver the highest level of *net aggregate welfare*, taking account of market as well as nonmarket effects; this is an issue of resource *allocation*, or *efficiency*. It must also entail a fair distribution of welfare between actors and groups of actors, which raises questions of resource *distribution*, or *fairness*. In a policy analysis perspective, fairness is not a moral question; rather, it means identifying and measuring the shares of aggregate benefits and costs of a policy accruing to different actors or groups of actors. This exercise, of course, is only possible after the preceding ones have been carried out, and then it takes the difficulty one step further, because identifying relevant *groups* of individuals is very tricky. Typically, distributive analyses focus on socioeconomic categories, or occasionally on categories defined through other traits (like age or gender). In LPP, groups would normally need to be defined primarily in terms of linguistic attributes (their first language and their skills in other languages).

Concluding Remarks

The economics of LPP provides a framework through which language policy options can be systematically compared, in order to assist citizens and the authorities in making better-informed choices and selecting, among competing courses of action, those that are likely to deliver a higher level of welfare and a higher degree of fairness. Applications mostly concern the protection and promotion of minority languages (Grin & Vaillancourt, 1999; Grin, Moring, Gorter, Häggman, Ó Riagáin, & Strubell, 2002), second language acquisition and skills (Grin, 2005), bilingual communication in a multilingual context (Selten, 1997; Ginsburgh, Ortuño-Ortín, & Weber, 2005)—in addition to the growing literature in *language economics* (as distinct from its policy dimensions), not quoted here.

The economic analysis of LPP raises specific theoretical and empirical difficulties, many of which are not solved at this time, but which offer exciting scientific challenges and opportunities for interdisciplinary cooperation.

Educational Research in Language Minority Students

AMANDA KIBLER AND KENJI HAKUTA

Introduction

The term “language minority student” encompasses a wide range of individuals who span ethnicities, ages, cultures, social and economic backgrounds, immigration histories, and levels of first and second language proficiency. The characteristic shared by members of this diverse group, however, is that their home languages are spoken by a minority of people in a given society: Turkish in Germany, Nahuatl in Mexico, or Chinese or Spanish in the United States, for example. While many language minority students are immigrants, others are indigenous members of a society or have family members who immigrated one or more generations earlier. Language minority students’ home languages sometimes have official status in the majority society, but educational institutions are often not obligated to teach in students’ home languages.

Language minority students have become prominent in schools as a result of increasing global migration and access to education. Because most compulsory educational systems are designed for language *majority* speakers in a given society, the education of language minority students poses unique challenges and has become a significant concern. Educational research is best understood in context, and so this review focuses primarily on research conducted in the United States.

What Types of Research Are Being Done?

Some of the typical issues found in educational research include, but are not restricted to: (a) program-focused research; (b) classroom-focused research; (c) language-focused research; and (d) student-, family-, and community-focused research.

Program-focused research investigates the relative effectiveness of various instructional program types. In the United States, much research attention has been devoted to the outcomes of bilingual education programs as compared to programs that use English as the primary or sole medium of communication. Several publications have synthesized results of studies on this topic (for example, August & Shanahan, 2006; Genesee, Lindholm-Leary, Saunders, & Christian, 2006). Program evaluations also focus on the impact of language policy decisions, such as Proposition 227, a controversial referendum in California that restricted bilingual education (Parrish, Perez, Merickel, & Linquanti, 2006).

Research at the classroom level includes investigations of both bilingual and English-only instruction. These studies address classroom practices aimed at developing oral language skills as well as first or second language literacy. Classroom research focuses on curricula and instruction not only in English as a second language or other language classrooms, but also in subject area classes (such as math, science, and language arts) in which language minority students are enrolled. This research has been undertaken using experimental comparisons as well as more interpretive and ethnographic approaches.

Although it overlaps to some degree with the previous category, language-focused research takes a more linguistic perspective in its examination of education. Some of this recent work is concerned with genres of language demanded in classrooms and follows a systemic-functional approach to language (e.g., Schleppegrell, 2004). Other work offers proposals for what teachers should know about language so that they can enhance the development of students' linguistic repertoires (e.g., Valdés, Bunch, Snow, Lee, & Matos, 2005).

A final category of research examines language minority students' out-of-school experiences, their families, and the communities in which they live. Ethnographic and other qualitative approaches are employed to explore the linguistic, cultural, and social practices of minority communities (Vásquez, Pease-Alvarez, & Shannon, 1994; Zentella, 2005), the richness of students' out-of-school language use (Lam, 2004), and complexities of the immigrant experience (Fu, 1995; Lee, 2005).

What Are the Major Themes Found in this Research?

Among diverse strands of research, several key questions are fundamental to investigations focused on language minority students. The following section outlines some of these major themes.

How Does One Build on the Native Language?

This first question deals with educators' and researchers' responses to minority students' native languages and the roles these languages should play in schools and society. If educators and researchers decide to build upon native language skills, they may choose to do so based on studies indicating that the first language plays an instrumental role in acquiring a second and has important symbolic, cultural, and societal value. Alternatively, some approaches to educating language minority students regard the first language as largely irrelevant to the teaching of the second, and it is therefore not a focus of instruction or research. Decisions to actively eradicate the native language are more rare and often reflect political convictions rather than pedagogical considerations.

How Does One Build Second Language Proficiency?

Language minority educational research also addresses the question of how students can best learn a societal language in school settings. Curricula, pedagogy, student placement, and teacher training are all issues affecting students' second language development. One major research concern in this area is the extent to which students should be taught through explicit language instruction or through more inductive forms of learning: While many researchers and theorists agree that there should be a balance between the two approaches, the manner in which this balance should be achieved for students of different ages and proficiency levels is yet to be determined. An additional concern is that many minority-language students live in linguistically isolated communities with little access to speakers of prestigious varieties of the majority language.

How Does One Encourage Content Learning While Students Are Learning a Second Language?

Language minority students must continue learning academic subjects even while they are still in the process of acquiring the majority language. In some school settings—such as dual-language and maintenance or transitional bilingual programs—academic learning in subjects such as math, science, history, or language arts continues through instruction in the native language. In other school settings, the majority language is used for content

instruction with students at all proficiency levels. While some students with limited second language proficiency may be placed in mainstream academic subjects without assistance or accommodations, in many classrooms teachers attempt to tailor curricula and instruction to language minority students or collaborate with language teachers, processes which have been thoroughly documented in the research.

How Should Language Minority Students Be Assessed?

Assessment of language minority students, whether it occurs as part of daily instruction or as part of national or international standardized tests, continues to be a major concern for researchers. At the classroom level, language minority students without sufficient proficiency in the majority language have difficulty demonstrating their academic knowledge on these measures. In relation to the assessment of language proficiency, research continues into developing and refining large-scale tests to reflect current understandings of the nature of proficiency and the manner in which second languages develop over time (e.g., WIDA Consortium, 2007). Although schools may test students' first language proficiency—and many using bilingual instructional methods choose to do so—the primary focus of research and accountability is performance on assessments of English-language proficiency.

Why Isn't Language Just Language?

Educational researchers must cope with the reality that many language minority groups are also socially and economically marginalized in society: in the United States, for example, Spanish speakers not only are the largest group of students classified by schools as "limited English proficient"—comprising 75–80% of all such students—but also belong to households (labeled "Hispanic" on US census forms) with poverty rates twice those of White/non-Hispanic and Asian groups. While some language minority students and their families enjoy privileged positions in society, much educational research is focused on those students from underprivileged, marginalized communities who traditionally fare poorly in educational institutions. In this way, issues of equity, which are not solely related to language, are a major focus of educational research in this field.

Researchers must also acknowledge a significant disjuncture between linguistically oriented research and social reality. For example, linguists such as Chomsky (1968) have provided insight into first language acquisition, outlining the ways in which all people, excluding those with language disorders, become competent speakers of their native language. Common discourse in many schools, however, falsely depicts some language minority students as "semilingual," competent in neither their native nor second language. Theorists have also debunked the myth that some languages are linguistically superior to, or objectively "better" than, others; Labov's (1972) work documenting the sophistication of language use in African American Vernacular English-speaking communities is an early example of such research. Yet schools often, knowingly or unknowingly, uphold linguistic stereotypes that value an abstract (and linguistically slippery) notion of "Standard English" while simultaneously devaluing the varieties of English spoken by many language minority students. A tradition of critical literacy research (e.g., Gútiérrez, Zitlali Morales, & Martínez, 2009) addresses these issues directly.

Looking Forward

As language minority populations continue to grow in schools, educational research focused on these students will likely increase as well. Educational systems are extremely complex, and efforts to improve the academic achievement of language minority students are likewise

multifaceted. Research from cognitive, psychological, pedagogical, social, sociocultural, critical, and policy perspectives should ideally work in concert to develop and accomplish a comprehensive language minority research agenda. This broader perspective can help researchers and practitioners understand factors contributing to academic success and failure as well as the place of minority languages, and their speakers, in society as a whole.

Edwards, John

HANS J. LADEGAARD

John Robert Edwards (b. 1947 in England) was educated at the University of Western Ontario (BA in Psychology) and McGill University (MA and PhD in Psychology). He is a Chartered Psychologist and a Chartered Scientist, and a member of several prestigious societies, including the Royal Society of Canada, the British Psychological Society, the Canadian Psychological Association, and the American Association of Applied Linguistics. He is editor of the *Journal of Multilingual and Multicultural Development* and of the *Multilingual Matters* series, and is on the editorial board of 13 international journals. He is currently Professor in the Department of Psychology, St Francis Xavier University, Antigonish, Canada.

Edwards has written more than 250 articles, book chapters, and reviews, nine books, and five edited monographs. The broad disciplines covered in his writing include the social psychology of language, sociolinguistics, and the sociology of language, focusing on topics such as bilingualism and multilingualism (Edwards, 1994), language and education (Edwards, 2010a), minority languages (Edwards, 2010b), language and identity (Edwards, 1985, 2009), and language and disadvantage (Edwards, 1979, 1989).

Long before interdisciplinarity became a buzz-word, Edwards insisted that good scholarship must be interdisciplinary and eclectic, make use of methodological triangulation, and always pay due attention to the bigger social picture. He has criticized much of the existing work in the social psychology of language and sociolinguistics, arguing that the literature often reveals “an undesirable narrowness of perspective” (Edwards, 2009, p. 1). He argues that no analysis of language should proceed from a “stand-alone” perspective; consequently, we need to understand the sociological, political, and psychological aspects of language use if we are to understand why some languages die while others thrive. Whatever the topic, Edwards has always strived to illustrate, in multiple ways, the connections between language and identity, and this implies a stronger focus on the symbolic functions of language (i.e., language used as an emblem of groupness, as a symbol, as a rallying point; cf. Edwards, 1985, p. 17), as opposed to the communicative functions. This in turn “necessitates attention to the social and political settings without which that symbolism, that group ‘marking’, would be empty” (Edwards, 2009, p. 2).

Edwards’ research has made significant contributions to the literature in several diverse areas, such as ethnicity and nationalism, language prescription, minority languages, language planning, constructed languages, and (language) attitudes and stereotypes. Particularly important are his contributions to the work on language and disadvantage in educational settings (Edwards, 1979, 1989, 2010a). His first book on language and disadvantage was published at a time when genetic deficiency theories (e.g. Jensen, 1973) and environmental deficiency theories (e.g., Bereiter & Engelmann, 1966; Bernstein, 1971) were strong in educational circles, and compensatory education was proposed as a means to “save” ethnically or socially disadvantaged children.

Edwards argued forcefully against these theories, claiming first, that sociocultural determinations of intelligence in standard IQ tests cannot be avoided; and second, that the implication of these theories is that certain groups and lower-class settings are seen as deficient because they do not exhibit middle-class practices and values. The school is

essentially a middle-class institution promoting middle-class values and norms (including linguistic norms), and this is why some children with lower-class and ethnic minority backgrounds are seen as deficient. Consequently, Edwards argues that the environmental “difference” position is the only logically tenable theory and advocates that “we should make the different-but-not-deficient argument wherever and whenever possible. Social prejudice may be inevitable in stratified societies, but it is not monolithic” (Edwards, 2010a, p. 16). More recent research suggests that both genetic deficiency theories and environmental deficiency theories are alive and well in academic circles. Herrnstein and Murray (1994) and Nyborg (2005), for example, argue that genetic deficiency still applies. These scholars claim that certain groups are more intelligent than others (white people more than black people; men more than women). And the idea that some social environments lead to intellectual deficiency never really lost ground and remains powerful in educational circles (see Edwards, 2010a, chapter 5 for a discussion). This only goes to show that Edwards’ work to rebut the evidence and to advance the environmental difference theory is as relevant as ever.

Another of Edwards’ hallmarks is his attempt to refute the linguistic deficit hypothesis which still prevails in (many) educational contexts. Certain nonstandard accents or dialects, or certain minority languages, are seen as inferior or even inherently deficient. Consequently, it is argued, children should learn to speak the standard language. Many teachers believe that speakers of nonstandard accents and dialects will inevitably fall into “the language trap” (cf. Honey, 1983), and need to master the standard language in order to advance socially and economically. Edwards insists that value judgments about language are in fact social judgments about the people who speak them, and when nonstandard accents and dialects are seen as deficient, it is because they are usually spoken by people who are stigmatized in society.

Edwards’ work has focused almost exclusively on the macro level of language use. He believes that “a broad-brush knowledge has more chance of applicability than fine-grained analysis” (Edwards, 2010a, p. 12). He is skeptical of much discourse-based language research, which he sees as inward-looking and “an incestuous preserve of little applied value” (p. 14). He criticizes ethnomethodology and its allies for being more like sects or cliques than scholarship—closed systems in which members talk to each other. The result, he argues, is that much research in these disciplines becomes a replication of the disembodied and decontextualized sterility which the ethnographic endeavor was meant to replace. Consequently, it has little or no relevance to larger social settings, such as classrooms. Although I agree with much of Edwards’ critique of discourse-based language research and consider it a much needed contribution to the debate, I would argue that some of his claims may fall under the sweeping generalizations fallacy. Is it really fair to argue, for example, that “in many cases, discourse studies do not reveal much that is new” (Edwards, 2010a, p. 11)? Surely, the same criticism could be made of much quantitative research. The main problem with much discursive research is that it dismisses work in the quantitative paradigm (e.g., questionnaire studies and experiments). I would insist that we need insights from both “traditional” (quantitative) and “new” (qualitative) paradigms if we want to see the bigger picture Edwards is calling for. We need depth as well as breadth, and one single paradigm is not likely to give us both.

Edwards’ writing style is direct, provocative, and refreshingly free from academic jargon, which means that researchers, students, and practitioners alike can read and benefit from his research. He is a man on a mission, and this may be one of the reasons why his works are so thought-provoking. Edwards is a scholar first and foremost and insists that scientific problems must be dealt with in a cumulative manner—this, he argues, is the hallmark of good science. But he also has a strong social and political message which permeates his scholarship: that the vast majority of issues that affect speakers of minority languages,

“foreign” languages, or nonstandard dialects have little to do with language. Rather, they are sociological, political, or psychological in nature: “they have to do with perceptions and prejudice, with stereotypes and assumptions, with power and subordination” (Edwards, 2010a, p. 12) and must be dealt with accordingly.

Edwards, Viv

LYNDA PRITCHARD NEWCOMBE

Professor Viv Edwards was born in 1950 in the Rhondda Valley. Bilingualism has been an issue at both professional and personal levels throughout her life, having grown up in Wales and with the recent extension of her family to include new Polish members.

Professor Edwards holds a PhD in linguistics from the University of Reading where she started her teaching career. She worked as lecturer and reader in sociolinguistics at Birkbeck College, University of London before returning to the University of Reading where she is currently professor of language and education and director of the National Centre for Language and Literacy.

Edwards's work has always centered on language and education. She played a pioneering role in establishing this area as the nexus for cross-disciplinary researchers with the founding in 1987 of the international journal of the same name. She also edits the Multilingual Matters series on *New Perspectives on Language and Education*.

At an early stage in her career, however, her interests centered firmly on linguistic diversity in education. In the late 1970s and 1980s, Edwards was the first researcher to seriously study the language of children from the Caribbean whose parents had settled in the United Kingdom. Her book, *The West Indian Language Issue in British Schools* (Edwards, 1979), was based largely on her PhD thesis; and *Language in a Black Community* (Edwards, 1986) was based on fieldwork with young people of African Caribbean heritage living in the English Midlands. Aware of her "outsider" status, she passed responsibility for further work on this topic, wherever possible, to the insider researchers who were emerging in the 1990s (Edwards, 1994).

The collection of papers, *Multilingualism in the British Isles*, co-edited with Safder Alladina (Edwards & Alladina, 1990), was another landmark publication, offering the first in-depth discussion of many of the newer minority communities. Other research and publications focusing specifically on minority languages include the evaluation of the Twf Project in Wales which promotes the value of bilingualism to the parents of babies and young children (Edwards & Pritchard Newcombe, 2005a, 2005b); and the development of bilingual multimedia storybooks as a pedagogical tool in Basque, Catalan, Frisian Irish, and Welsh (Edwards, Monaghan, & Knight, 1999; Edwards, Monaghan, & Hartley, 2000; Edwards, Pemberton, Knight, & Monaghan, 2002), as part of the European Commission funded Fabula Project.

Teaching and learning—and particularly literacy learning—in multilingual classrooms has been a recurrent theme in her research and publications (Edwards 1983, 1998, 2009; Edwards & Redfern, 1992; Edwards & Corson, 1997). Her interest in literacy relates to her longstanding role as director of the National Centre for Language and Literacy and extends to learning materials, as demonstrated in her 1995 book with Sue Walker on *Building Bridges: Multilingual Resources for Children* and her current research on African language publishing for children.

Edwards's interest in Africa relates in part to family links with Zimbabwe and partly to supervision of PhD students working on literacy-related topics from across the continent. Collaboration with African colleagues as part of the Training for Early Literacy Learning Project and the current project on African language publishing has deepened this commitment.

More recently, she has turned her attention to the pastoral and academic needs of Chinese students in higher education (Edwards & An Ran, 2007; Edwards, An Ran, & Daguo Li, 2008), linking her experience of work with international students at the University of Reading to growing concern around the responsibilities of universities as part of the internationalization agenda. In recognition of her contribution to the debate on Chinese students in British Universities, she was elected a fellow of the Royal Society of Arts in 2008.

Edwards's ability to synthesize the extensive and rapidly growing literature in this area is demonstrated in *Multilingualism in the English-Speaking World: Pedigree of Nations* (Edwards, 2004) which was selected as the British Association of Applied Linguistics book of the year in 2005.

Another characteristic which runs through all her work is her steadfast commitment to social justice.

Ehlich, Konrad

WINFRIED THIELMANN

Biographical Details

Konrad Ehlich (1942–) is a German linguist. He studied Protestant theology, philosophy, German language and literature, linguistics, and oriental languages in Bielefeld, Heidelberg, Mainz, and Berlin. In 1970 he completed his masters degree in theology with a thesis on the categorization of verb conjugations in the linguistics of Hebrew. His dissertation on the deictic system of ancient Hebrew was accepted in 1976 and published in 1979. His postdoctoral dissertation on interjections was accepted in 1980 and published in 1986. After appointments as a lecturer/researcher at the Freie Universität Berlin and Universität Düsseldorf, in 1981 he accepted a professorship in linguistics and literature at the Katholieke Hogeschool Tilburg (now University of Tilburg) in Tilburg (Netherlands). Following this, from 1983 to 1992 he was the chair of German as a Foreign and Second Language at Universität Dortmund; from 1992 to 2007 he was the chair of the Institute of German as a Foreign Language at the Ludwig-Maximilians-Universität in Munich. He has been an honorary professor of Freie Universität Berlin since 2009. Over the course of his career Ehlich has contributed over four hundred publications to a wide range of linguistic disciplines, including general linguistics, pragmatics, discourse analysis, text theory, German as a foreign and as a second language, comparative academic language studies, applied linguistics, institutional communication, intercultural communication, language sociology, language policy, intonation, and Hebrew language and literature.

Functional Pragmatics (FP)

In collaboration with Jochen Rehbein, Konrad Ehlich developed a theory of linguistic action called functional pragmatics (FP), which constitutes the theoretical background of most of his publications. In FP, language is neither a “system of signs” (de Saussure) nor something hardwired into our brains (Chomsky). It is also neither a game (Wittgenstein) nor a stimulus (Bloomfield). With reference to Bühler’s concepts of linguistic fields and the actional quality of language as well as Austin’s and Searle’s speech act theory, Ehlich and Rehbein conceive of language as a complex of form-function-nexus anchored in reality as societal practice. In societies, human beings pursue purposes which correspond to a societally elaborated system of needs. Purposes are transindividual—people belonging to a certain society know, for instance, how to avail themselves of the society’s artifacts and institutions. They do so as a matter of routine. Some purposes can be pursued through linguistic action. Language, as a societally elaborated form, allows human beings to act on each other’s minds. Through linguistic action, a speaker can provide the listener with knowledge, make the listener do something, and so forth. In their paper “Sprachliche Handlungsmuster,” Ehlich and Rehbein (1979) demonstrate that the repetitive nature of societal reality leads to the societal elaboration of complex linguistic structures, *linguistic action patterns*, through which interactants regularly pursue purposes. Typical examples of such patterns are *question and answer*, *justification*, *request*, *promise*, *apology* and *assertion*. In their book *Muster und Institution* (Ehlich & Rehbein, 1986), which is entirely based on transcripts of authentic classroom discourse,

The Encyclopedia of Applied Linguistics, Edited by Carol A. Chapelle.

DOI: 10.1002/9781405198431.wbeal0360

Ehlich and Rehbein show that certain action patterns may be significantly altered by institutional usage: teachers, for instance, usually do not ask a question because they want to know something, but because they want to know if the students know something. In reconstructing linguistic action patterns from authentic discourse, FP, in contrast to conversational analysis, makes assumptions about the mental steps speakers and listeners take as they work through a pattern.

Linguistic Devices, Linguistic Purposes, Linguistic Procedures, and Linguistic Fields

In its attempt to reconstruct the nexus between linguistic and societal purposes as well as the nexus between linguistic actions and their constitutive devices, FP's approach to language is overall "pragmatic" (Ehlich, 1986b/2007); there are no autonomous morphological, syntactic, and lexical modules to which a pragmatic module can be "added." Language is an action form societally elaborated for the pursuit of purposes. As a consequence, language's intrinsic makeup is also purposeful.

In "Sprachmittel und Sprachzwecke," a study in linguistic engineering, Ehlich (1981/2007) demonstrates that the intrinsic makeup of languages is the result of material choices made by language communities. If, for instance, intonation is used to differentiate between linguistic units, the linguistic units of such a language, in order to carry intonation, tend to be monosyllabic, with optional opening and closing consonants. Even with a complex tonal system, such structures only yield about 5,000–10,000 tonal syllables, which means that languages organized in such a fashion are prone to developing a complex phraseology to satisfy lexical needs. As the device of intonation is already being used as a diacritic, it is no longer free to differentiate between basic illocutions. This is why tonal languages tend to have illocutionary particles. Different language types thus arise from very basic material choices.

Speakers can combine and integrate linguistic units so that they ultimately form complete speech actions. This is possible because linguistic units themselves possess actional quality. In FP, such linguistic units of actional quality are called *linguistic procedures* (Ehlich, 1986b/2007). Linguistic procedures can be part of five functional nexus—*linguistic fields*—which are probably constitutive of every language (Ehlich, 1986b/2007).

With a *symbolic procedure* from the *symbolic field*, the speaker makes the listener call upon a knowledge element. Employing a *deictic procedure* from the *deictic field*, the speaker makes the listener focus his attention on something that may be within the space of perception, but may also be part of other spaces within which deictics can be functional, such as discourse space, text space, or imagined spaces (Ehlich, 1979). Through *operative procedures* from the *operative field* (typically anaphora, plural and case suffixes, affixes of word formation, articles, word order, stress, etc.) speakers communicate the makeup of their utterances—for instance, the differentiation between the topic and the comment of an utterance. *Incitive procedures* such as interjections allow for direct interference with the listener's actions (Ehlich, 1986a). Through *expressive procedures* such as "wonderful!" speakers align themselves emotionally with listeners.

Ehlich treats word forms such as *ask-s* as *procedural combinations* (here: symbolic + operative). Speech actions arise from *procedural integration* (Ehlich, 1998a/2007)—typically by operational procedures working upon an elementary propositional basis consisting of symbolic procedures. The utterance *The doctor comes on Mondays* consists of an elementary propositional basis (*doctor-come-Monday*) which achieves the status of an assertion by operational procedures working upon this basis: Word order (positioning the subject before the predicate), anaphoric subject-predicate-agreement, plural suffix, and determination (*the*).

Ehlich not only expanded Bühler's notions of linguistic fields, he also produced empirically based detailed analyses of certain linguistic procedures. Apart from his book on the use of the deictic system in ancient Hebrew (1979), there are numerous studies on the function of deictics in texts (e.g., 1982/2007, 1989/2007) and on operative anaphora (e.g., 1982/2007, 1983c/2007) and articles (2003/2007). His book on interjections (1986a) is one of the first monographs to put forth a theory that fully explains the functionality of this class of expressions and empirically explores the most prominent German interjections.

Discourse and Text

Being a strong advocate of the primacy of the spoken word, Ehlich arrives at a very specific understanding of discourse and text (1983b/2007). *Discourse* arises when speaker and listener are copresent. Apart from monoprocedural utterances such as *there!*, discourse consists of speech actions, that is, procedural integrations. A speaker may utter several speech actions in a row as, for instance, when telling a story (Ehlich, 1983a/2007), so that discourse consists of a *concatenation of speech actions*. Or speaker and listener may work, in sequence, their way through a linguistic action pattern so that discourse consists of a *sequence of speech actions*.

Text is the result of societal problem solving with regard to the fleetingness of language: Texts are suspended linguistic action to overcome a speech situation where speaker and listener are not copresent (Ehlich, 1983d/2007). The message memorized by a messenger is a text, so are genealogies or myths passed on within oral societies to ensure the maintenance of essential knowledge (Ehlich, 1983b/2007). Thus, texts occurred prior to writing.

Whilst in discourse every speech action has a "here-I-now," that is, Bühler's "origo," as the center of deictic reference, textual language is characterized by "transcending the immediate 'origo'" (Ehlich, 1983b/2007, p. 555). The "here" in the message a messenger delivers is the "here" of the sender; the "today" in a letter is not the "today" of the reader. Deictics also play a very important role with regard to textual coherence. Writers use anaphora (e.g., *it*) to instruct readers that they can maintain their focus on a topic; they use anadeictics (e.g., *this*) to instruct readers to refocus their attention on a new topic (Ehlich, 1982/2007, 1983c/2007, 1989/2007).

Academic Language

At the Institute of German as a Foreign Language in Munich, Ehlich became very interested in the structure of the academic variety of German and other languages. In Ehlich (1995) he demonstrates that—despite previously held beliefs—academic varieties are not just characterized by terminology, but also by complex syntagmas made up of ordinary linguistic devices. Such syntagmas (e.g., *it is meanwhile widely held; we derive the following conclusion*) have a meaning particular to academia and they occur in most scientific discourses and texts. They constitute an *ordinary academic variety* that serves as a metalanguage for research. Other structures such as *currently there is no theory satisfying these requirements* also consist of ordinary language, but are due to the argumentative side of academic discourse. Academic texts, in the arts as well as the sciences, are very rich in theses argumentative, *eristic* devices (Ehlich, 1993). In contrast to terminology, ordinary academic language and *eristic* devices provide major obstacles even to very competent language learners, as they are syntactically complex, employ ordinary words in a way different from ordinary language, and have a meaning particular to academic culture.

In a situation where English is becoming more and more entrenched as the only language of science and research, Ehlich is continuing to make a case for academic plurilingualism.

One of the primary functions of any language is the *gnoseological function* (Ehlich, 1998b/2007), that is, the guidance a language provides in conceiving of the world and making this knowledge communicable. Languages differ significantly in how they serve this function. Hence, Ehlich has argued in numerous publications that the academic varieties of different languages provide complementary access to the phenomena under scientific investigation. Thus, the maintenance of academic plurilingualism ultimately serves the goal of scientific innovation.

Category Formation in Linguistics

Ehlich has made numerous contributions to the history of linguistics and linguistic category formation. In these publications he argues that linguistics, as a very old discipline, transports certain biases that have led to continuous misrepresentations of linguistic phenomena. In “Analytische Sedimente” Ehlich (2002a/2007) demonstrates that the ancient terms still in use for word classes (e.g., *noun*, *adjective*, *adverb*, *preposition*) are descriptive in a way that may actually be misleading. The term *preposition*, for instance, literally means “a word that stands before another.” This description only recognizes the preposition and the word that follows. In the phrase *the vase on the table*, however, the preposition *on* establishes a relation between *the vase* and *the table*—a fact that is overlooked when analysts, guided by the term *preposition*, focus only on what comes after a preposition. Similarly, the term *noun* (Lat. *nomen*) is responsible for a semantics based on the functionality of proper nouns (i.e., names for individual entities), even though the semantics of most nouns (e.g., *table*, *invention*, *beer*) cannot be understood in these terms.

In “Medium Sprache,” Ehlich (1998b/2007) argues that linguistics has tried for a very long time to abstract from the fact that language is a medium. As a medium, language cannot be described on its own, but only in relation to speaker and listener. Linguistic theory formation, however, has frequently attempted to conceive of language as an absolute object. A case in point is European structuralism erected upon Saussure’s concept of *langue*: language as such, devoid of speech.

Further Areas

Ehlich has also substantially contributed to the following areas: theory of writing and written language (e.g., 1983e), language policy (e.g., 2007a, 2007b), language acquisition (e.g., 2005), language and literature (e.g., 2002b), and narratology (e.g., 1984).

Elite/Folk Bilingual Education

ANNE-MARIE DE MEJÍA

Introduction: Why This Distinction Is Important

The literature on bilingualism and bilingual education is full of dichotomies. Thus, we hear frequent references to such “polar opposites” (Hornberger, 1989, p. 273) as: additive versus subtractive bilingualism, transitional versus maintenance models of bilingual education, and international versus intranational languages. If Hornberger is to be believed, we should be looking at a variety of dimensions represented on the continua of biliteracy, rather than at such dichotomies. Why then, it may be asked, is it important to distinguish between the notions of “elite” and “folk” bilingualism and bilingual education?

In order to answer this question, it is important to start with a historical perspective, looking at the genesis of these terms, how they were conceived, and how they have changed over the years. I will then go on to highlight key issues involved in this distinction, such as the separation engendered between these two different modalities, and will argue for the importance of engaging points of contact between what have been traditionally seen as two separate worlds. I will end by suggesting possible ways forward in the future.

Elite/Folk Bilingualism: A Historical Perspective

One of the earliest references I have been able to find to these terms is Anderson (1976) who, in referring to the language arena in Texas at the time talks about “popular” as opposed to “elite” bilingualism, characterizing the difference between them in the following manner: “popular bilingualism is the uncultivated use of two languages, most frequently English and Spanish in this part of the country, for the purpose of communication. It follows then, that elite bilingualism is the cultivated use of two languages” (Anderson, 1976, p. 497). This early formulation thus sets the scene for a hierarchical division of types of bilingualism and bilingual education, which we see developing in later writings on the topic.

A more well-known formulation of this dichotomy refers to “elite” and “folk” bilingualism, a distinction created by Fishman in 1977 in which he refers to folk bilinguals as language minority groups whose own language does not have a high status in the dominant language society in which they reside, while elite bilinguals are those who speak a dominant language in a particular social group and who also speak another language which gives them additional value within this group.

Paulston (1975, cited in Harding & Riley, 1986, p. 24) refers to “elite” bilingualism as “the privilege of middle-class, well educated members of most societies,” a type of bilingualism which typically involves prestigious international languages (Edwards, 2004). For this reason, Baker and Prys Jones (1998) use the term “prestigious bilingualism.” Valdés and Figueroa (1994, p. 12), on the other hand, talk about “elective” bilingualism in the sense that this concerns

individuals who choose to become bilingual and who seek out either formal classes or contexts in which they can acquire a foreign language . . . and who continue to spend the greater part of their time in a society in which their first language is the majority or societal language.

In the European context, James (2000, p. 31) observes that "English has moved from being a component of 'elite' bilingualism through 'cultural' bilingualism . . . to 'popular' bilingualism." In other words, English has become "popular" or widespread in many European countries, in the sense of being present "within the ecology of inter-society. . . or . . . intra-society communication," not just being used within education systems.

The related concept of "optional bilingualism" also focuses on the element of choice involved in this type of bilingualism. Elite bilinguals consciously choose to become bilingual or multilingual due to a perception of the advantages that will result from this decision. This determination has a number of important consequences, such as the type of education program selected and the consideration of actions taken to further incipient bilingualism or multilingualism in these individuals. The term "privileged bilingualism" echoes Paulston's (1975) notion of elite bilingualism as being available only to a small number of individuals who have the means to gain access to it (de Mejía, 2002).

The key element of choice is not associated with the category of folk bilingualism, which has been characterized as "the conditions of ethnic groups within a single state who have to become bilingual involuntarily, in order to survive" (Tosi, 1982, cited in Harding & Riley, 1986, p. 24). These have also been referred to as "circumstantial" bilinguals (Valdés & Figueroa, 1994) as they are often obliged to learn another language in order to be able to function effectively in the majority language society due to circumstances of immigration or displacement. Frequently, the first language of these bilinguals is in danger of being replaced by the dominant societal language, and this constitutes a subtractive context (Baker, 2006). It is interesting to note in this respect, however, that in the Japanese context, bilinguals who do not speak Japanese as one of their native languages would be likely to be classified as "folk" bilinguals (Masayo, 2001), thus emphasizing the importance of the national language in the recognition of the status of being bilingual.

Another set of terms: "voluntary/involuntary bilingualism" relates to the distinction introduced by Ogbu (1982) between voluntary and involuntary minorities in the USA. The use of these terms refers to the idea that African slaves and Mexican and Puerto Rican minorities have a different ("involuntary") type of relationship to the wider US society than do "voluntary" immigrants, such as European immigrants in the early twentieth century, and Central American and Southeast Asian immigrants in the 1970s and 1980s. The use of these terms foregrounds the notion that, while it is one thing to "choose" voluntarily to become bilingual from a position of privilege, it is quite another to have this imposed by circumstances, such as war, conquest, or slavery (de Mejía, 2002).

A study of the use and attitudes toward the Spanish language in New York (García, Martínez, Disla, & Paulino, 1988) reveals that the differing attitudes observed with regard to elite and folk bilingualism seem to stem from the fact that most of the bilinguals from the Hispanic communities interviewed in the study had learned English in their countries of origin. The authors conclude that "their linguistic behavior and attitudes vis-à-vis bilingualism are shaped by the notions of elite bilingualism which they bring from their country of origin, as well as by the prejudice toward folk bilingualism which they encounter in the United States" (García et al., 1988, pp. 508–9).

This clearly indicates the influence of social values in the differential valuation of these types of bilingualism, and, as Hélot (2007) notes, the two terms are clearly socially and ideologically marked and do not adequately account for the multiplicity of situations of bilingualism and multilingualism obtaining in the world. Indeed, Edwards (2004, p. 27)

reminds us that the distinction between these two traditions may well become further blurred as “elite bilingualism need not rule out motives of necessity more usually associated with the folk variety.”

Key Issues in the Development of Elite/Folk Bilingual Education

Romaine (1999) criticizes what she sees as a bias in the literature toward the study of “elite” rather than “folk” bilingualism, with a resulting narrowness of focus to research questions posed in relation to children’s simultaneous bilingual development. The author maintains that this has resulted in bilingualism and bilingual education being conceived of differently in minority and majority populations.

Smith (2003) endorses Romaine’s vision of these distinctions, noting that these two traditions have usually been separated in the Mexican context. He adds that, in elite situations,

bilingualism generally involves at least one European language of wider communication (such as English or Spanish), and bilingual education is typically undertaken voluntarily by families who recognize the prestige of bilingualism and are able and willing to devote considerable financial resources to raising bilingual children. (Smith, 2003, p. 9)

He also recognizes that in “folk” contexts, such as Mexico’s indigenous and immigrant communities, the home language of young bilinguals is often underdeveloped and ignored in schools, leading to subtractive rather than additive bilingual processes.

Considering this historical imbalance and separation between these two traditions, we may ask how far it is possible to reconcile them and why it might be important to do so. Smith (2003) provides a number of powerful reasons for considering the two as related phenomena. First of all, he argues that, as from a cognitive perspective folk and elite bilinguals acquire new languages and develop languages they already use in similar ways, we should recognize the similarity of the underlying principles involved in both forms of bilingualism and bilingual education. He also raises the question of the implications of the rapid growth of English (associated with “elite” bilingual education programs) in relation to the disappearance of many of the world’s smaller indigenous languages and asks how far the development of English should be seen as a priority in communities which are struggling to maintain the vitality of their native languages.

Smith’s final justification for considering both forms of bilingual education is perhaps the most convincing of all. He maintains that “historical, institutional and ideological separation has prevented us from seeing ways in which [these programs] may actually be quite similar” (Smith, 2003, pp. 10–1). He goes on to say that issues concerning community identity and language allocation in bilingual programs, teacher training, and government-sponsored language policies and the role of literacy in bilingual teaching and learning are common concerns in any type of bilingual program and that educators can learn from ways in which these questions have been handled in different contexts.

Hamel (2008) also argues for an integrated policy of language and education in Latin America in relation to the specific domains of indigenous (folk) bilingual education and those pertaining to elite private education originating from European immigrant communities who settled in the subcontinent. He notes: “The two types of communities and their schools position themselves at opposite poles of social stratification and the scales of extreme inequality that characterize all Latin American countries, and their actors hardly ever cross paths or exchange words” (Hamel, 2008, p. 59).

In relation to Smith’s vision of the positive value of educators seeing how common issues of language and education policy and practice have been dealt with in other contexts,

Hamel considers that there are two specific ways in which elite bilingual education programs can contribute to indigenous education. The first refers to the creation of contexts of learning which help to foster the development of self-reliance in minority language students' use of their own languages and cultures, enabling them to be "confident in their capability of learning and where the whole environment stimulates enrichment education" (Hamel, 2008, p. 92). Hamel sees the second, more "technical," contribution of elite bilingual education with regard to the development of communicative approaches regarding content teaching aimed at the development of linguistic and communicative proficiency in a second or foreign language. He considers this an area in which elite programs have a tradition of success, whereas in indigenous schools, these concerns are still in their infancy.

This discussion recalls the important contribution made by Hornberger (1991, p. 226) in her revisiting of bilingual education typologies, where she contends that enrichment bilingualism should be used in the broader sense that Fishman (1976) originally intended for it, "extending it beyond its elitist origins." She thus sees the defining characteristics of enrichment bilingual education as the fact that "majority language speakers as well as minority language speakers learn a second language; and the minority language is recognized as a potential resource for the nation" (Hornberger, 1991, p. 234). In this way language development and additive bilingualism, as well as cultural pluralism, are promoted and extended for all bilingual students.

Kendall King (2005) in her work with the Saraguro indigenous community in Ecuador has extended Hornberger's discussion by referring to the creation of an alternative enrichment bilingual education program which combines the additive goals of the "elite" model with speakers and languages which tend to be associated with "folk" bilingual educational provision. The author appeals for studies on Andean bilingual education "to move beyond the traditional dichotomy of . . . enrichment (typically English oriented) programs promoting additive bilingualism for elite students, on the one hand, and transition (Spanish oriented) programs promoting subtractive bilingualism for indigenous groups, on the other" (King, 2005, p. 11).

Conclusions and Future Developments

So what conclusion can we come to with regard to elite and folk bilingual education? One point which has become clear, I would maintain, from the above discussion is that in the words of Anderson (1976, p. 499), "Popular and elite bilingualism can be and must be reconciled." A dichotomy which may have been useful in its original formulation to draw attention to the differing values and ideological assumptions associated with these two traditions needs to be questioned and refashioned. We need to go beyond a binary vision in order to be able to represent the nature of bilingualism and multilingualism more appropriately in relation to the complex, shifting realities of the world today. As García (personal communication, March 20, 2005) acknowledges with regard to the situation in the USA, "The old paradigms of bilingual education do not work anymore. Bilingual situations today are fluid." The implication is that if we continue to use a naturalized discourse which focuses on dichotomies, barriers will continue to exist and the lack of a shared discourse will be exploited to create division, so that bilingualism in minority languages will continue to be seen as a disadvantage (Hélot & de Mejía, 2008).

In this article I have tried to suggest that the distinction between elite and folk bilingual education which was coined in the 1970s needs to be seen in the light of current global tendencies, where developments in majority language bilingual programs may be seen as having relevance to minority community programs, and where the linguistic and cultural

experiences of “immigrants, exiles, refugees and other ‘transnationals’” may help to enrich bilingual and multilingual educational processes from their “double vision” and their “multiple ways of using . . . languages to voice an alternative worldview and a critical perspective” (García, Skutnabb-Kangas, & Torres-Guzmán, 2006, p. 10).

Although much of this discussion has centered on developments in Latin America, this does not mean to say that this is the only part of the world where these distinctions are discussed. For example, recently, Hélot (2007) has focused on the situation in France and has argued that the dichotomy of elite and folk bilingualism and bilingual education serves as part of a system of representations which reflects the unequal character of different bilingual situations and which, in turn, becomes discriminatory in itself. She reminds us that the distinction between folk and elite bilingualism still underlies the educational language policies of many European countries, which, while investing a great deal in developing elite forms of bilingual education in dominant languages, neglect and even stigmatize the bilingualism of children of immigrant backgrounds. The author recommends an integrated approach, or, in other words, “a way of thinking together of middle class children’s bilingualism and that of minority (children), analyzing similarities, rather than differences” (Hélot, 2007, p. 38). Thus, Hélot maintains that the rejection of a dichotomized viewpoint may lead to a more nuanced vision of bilingualism in its social context, which may help to influence the social actors and to reduce the inequality between the two groups.

I would like to end this discussion of contrasting traditions by referring to an image which captures the double nature of the phenomenon under discussion, an image of “claroscuros” characterized by Barriga Villanueva (2007, p. 14) in her discussion of bilingualism in Mexico, in which “the luminous side is related to a high level of culture, of personal prestige . . . ; the dark side . . . is that which is related to the power and domination of a hegemonic language.” I would suggest that one way forward in the 21st century would be to problematize these clear, unequal distinctions and help those interested in the development of a more integrated, equalitarian vision of bilingualism and bilingual education to go beyond these binary oppositions toward a deeper understanding of these complex, multidimensional interrelations.

Ellis, Nick

PATRICK REBUSCHAT

Nick Ellis (1953–) is a British psychologist who is best known for his influential research and publications on the cognitive aspects underlying second language (L2) acquisition and processing. A leading figure in L2 research, his work covers a wide range of topics, including implicit and explicit learning, emergentism, usage-based approaches to language acquisition, construction grammar, frequency effects in language, reading and spelling acquisition, and developmental dyslexia. In terms of methodology, Ellis has addressed these topics by means of behavioral experiments (e.g., Ellis, 1993; Ellis & Schmidt, 1997, 1998; Ellis & Sagarra, 2010), analysis of large-scale corpora (e.g., Ellis & Ferreira-Junior, 2009; Ellis & O'Donnell, in press), and computational modeling (e.g., Ellis & Schmidt, 1997, 1998; Ellis & Larsen-Freeman, 2009a). His research has been funded by a substantial number of grants, including highly competitive awards from the National Science Foundation (United States), the Economic and Social Research Council, and the Medical Research Council (both United Kingdom).

Ellis read psychology, philosophy, and physiology (PPP) at the University of Oxford gaining a BA in 1974. He then moved to the University College of North Wales (now Bangor University), to pursue postgraduate studies in cognitive psychology, receiving his PhD in 1978. After completing his doctorate, Ellis joined the School of Psychology at Bangor as a faculty member, an affiliation that would last for 26 years. In 2004, Ellis moved to the University of Michigan, where he is currently research scientist at the English Language Institute, professor of psychology, professor of linguistics, and associated faculty at the Center for the Study of Complex Systems. In 1992, Ellis was visiting professor at Temple University (Japan campus), in 2003, visiting professor at the University of Auckland, New Zealand, and in 2011, external senior fellow at Freiburg Institute for Advanced Studies. In addition, he is honorary research fellow at the School of Psychology, Bangor University.

Ellis is one of the most prolific contributors to the field of second language acquisition (SLA), with over 150 published journal articles and chapters to his name. His work has appeared in key journals such as *Studies in Second Language Acquisition*, *Language Learning*, *Applied Linguistics*, *Modern Language Journal*, *Language and Cognitive Processes*, *Annual Review of Cognitive Linguistics*, *Annual Review of Applied Linguistics*, *Quarterly Journal of Experimental Psychology*, and *Applied Psycholinguistics*. He also contributed a significant number of invited chapters to important state-of-the-art volumes (e.g., Robinson, 2001) and handbooks (e.g., Doughty & Long, 2003; Kroll & de Groot, 2005). In addition to his article publications, Ellis edited three influential volumes, namely *Handbook of Spelling: Theory, Process and Intervention* (Ellis & Brown, 1994), *Implicit and Explicit Learning of Languages* (Ellis, 1994), and more recently, *Handbook of Cognitive Linguistics and Second Language Acquisition* (Robinson & Ellis, 2008). He is also the coeditor of three special journal issues on “Language Emergence: Implications for Applied Linguistics” (Ellis & Larsen-Freeman, 2006a); “Language as a Complex Adaptive System” (Ellis & Larsen-Freeman, 2009b); “Input and Second Language Construction Learning: Frequency, Form and Function” (Ellis & Collins, 2009); and a special journal section on “Constructing a Second Language” (Ellis & Cadierno, 2009).

Nick Ellis has presented his work widely (over 240 presentations). He has given keynote addresses and invited talks throughout the world, from Japan, New Zealand, Taiwan,

Singapore, and China via Turkey, Switzerland, Germany, France, Italy, Sweden, Finland, Denmark, Belgium, the Netherlands, Spain, the United Kingdom, and Ireland to the United States and Canada. Ellis is also well known for his service to the profession, especially in his role as editor (1998–2002) and general editor (2006–) of *Language Learning*, one of the flagship journals in the field. He is on the advisory board of several journals, adviser to the *Oxford University Press Applied Linguistics* series, and serves as a reviewer for many academic journals, publishers, and funding bodies, including the European Science Foundation, the National Science Foundation, the Wellcome Trust, and the Medical Research Council.

Topics and Ideas

The Associative-Cognitive CREED

Nick Ellis's views on the nature of language and cognition are expressed in a series of influential review articles and position papers (see especially Ellis, 1998, 2002, 2005, 2006a, 2006b, 2006c, 2007, 2011a, 2011b). Of particular relevance to the applied linguistics community will be the Associative-Cognitive CREED (Ellis, 2006a), a framework that summarizes Ellis's position succinctly. The Associative-Cognitive CREED holds that L2 acquisition is **C**onstruction-based, **R**ational, **E**xemplar-based, **E**mergent, and **D**ialectic. The basic units of language representation are *constructions*, that is, conventionalized form-meaning pairings, entrenched in the learner's mind. Constructions vary in size and complexity, ranging from simpler units such as morphemes (*anti-*, *-ed*) and words (*papaya*, *pineapple*) to more complex constructions such as idioms (*know the ropes*) or the ditransitive (SUBJ-V-OBJ1-OBJ2, *She gave him a mango*, *He baked her a cake*). Constructions are learned by exposure to positive input and by means of general cognitive abilities, that is, we learn language in essentially the same way as we learn anything else. Because of this, L2 acquisition is governed by the general laws of human learning, both associative (Ellis, 2006b, 2006c) and cognitive. Importantly, how a given construction is acquired and processed will depend, to a large degree, on its probability of occurrence in the input. Our tacit linguistic representations reflect the co-occurrence statistics of different constructions in the environment, and we make extensive use of this information when comprehending and producing utterances. Ellis (2002) provides a thorough discussion of the role of frequency in language acquisition and processing.

Constructions are frequently ambiguous—Ellis (2006a) gives the example of utterances such as “Wonderful!,” “One, two, three,” “Once upon a time,” and “Won the battle, lost the war,” which all share the opening sounds [wʌn], though the meaning in each case is different. Despite this ambiguity, language processing proceeds efficiently and we only rarely assign the wrong interpretation. Our language processor is said to be *rational* in the sense that its behavior is as efficient as it could be, given the problem it must solve. The mechanism is “optimally adapted” to its environment and deals with problems like ambiguity in the speech signal by considering several sources of information, including the frequency, recency and context of constructions. While much of our language use is formulaic, any theory of language also needs to account for our ability to generate novel constructions. According to the CREED, our linguistic knowledge corresponds to a “frequency-tuned conspiracy of memorized exemplars of construction usage” (Ellis & Larsen-Freeman, 2006b, p. 562). Some of these exemplars are more abstract and generative than others, e.g., the English plural construction [NOUN+s], the regular past tense construction [VERB+ed], or the covariational conditional construction (The Xer the Yer, as in: *The more, the merrier*; *The more you eat, the more you want*, etc.) We acquire these types of patterns by means of abstraction from a significant amount of exemplars, that is, they are *exemplar-based*. After

encountering a sufficiently large number of plural words (*dogs, cats, tables, chairs, etc.*) or past tense forms (*walked, jumped, placed, etc.*), we retain not just the specific exemplars, but also construct a representation of the underlying pattern (NOUN+*s* and VERB+*ed*, respectively).

Language is seen as a complex, dynamic system that *emerges* from interrelated patterns of experience, cognitive mechanisms, and social interaction (see the contributions in Ellis & Larsen-Freeman, 2009b). The complexity of language is the result of relatively simple developmental processes being exposed to a highly complex environment. The regularities that are captured in linguistic analyses (e.g., parts of speech, syntactic roles, etc.) emerge as the learner's perceptual, cognitive, and social functions derive structure from the environment. However, these regularities are held to be very different from the mental representations that underpin actual performance. That is, the brain does not process information by following a computational "rule," even though we can describe the linguistic behavior as being rule-like. According to the emergentist view, the initial state of language acquisition does not involve innate universal grammar, but builds instead from universals of social interaction, human embodiment, and the physics of our environment. From this starting point, we quickly respond to patterns present in the input and, through associative learning mechanisms, rapidly acquire frequency-tuned representations. Importantly, this learning process quickly becomes optimized to our specific linguistic environment, that is, the system becomes tuned and committed to the first language (L1). The flipside of this optimal adaptation to our environment is that, when we begin learning an L2 later in life, our experience with the new language is affected by prior associations. We perceive the L2 input through mechanisms that were tuned for a different linguistic system, which explains why L2 acquisition suffers from transfer effects. Ellis (2006b, 2006c) provides a convincing account of L1 interference in terms of associative learning theory.

Adult learners generally fall short of achieving native-like competence in the L2, and social-interactional or pedagogical intervention, for example, in the form of feedback, might be necessary to further promote acquisition. One of the reasons why feedback and other instructional techniques work is that they help the learner notice relevant cues in the input that they would not register otherwise. Adult learners can therefore overcome the limits imposed by a learning mechanism that is optimized for the L1 when provided with additional evidence from other discourse participants. In this sense, L2 acquisition is also a *dialectic* process, involving the language learner in a "tension between the conflicting forces of their current interlanguage productions and the evidence of feedback . . . that allows socially scaffolded development" (Ellis, 2006a, p. 111).

Implicit and Explicit Learning and Memory

One of the most widely debated questions in SLA research concerns the role of implicit and explicit learning and memory, and Nick Ellis has been an active contributor to this debate for the past two decades (see e.g., Ellis, 1993, 1994, 1995, 2005, 2007, 2011a). According to Ellis (2005, p. 306), the "bulk of language acquisition is implicit learning from usage," and most linguistic knowledge is unconscious. However, while most of L1 acquisition involves implicit learning, these mechanisms are insufficient for L2 acquisition because the learner's system is already tuned to the native language. L2 learners must therefore overcome the processing habits of the L1 by recruiting additional resources of explicit learning and knowledge. While there is no direct interface—explicit and implicit knowledge are quite distinct, involving different types of representation and different neural substrates, and one form of knowledge cannot be converted into the other—there is nonetheless a "weak interface." Explicit knowledge can affect implicit learning in a variety of ways (see Ellis, 2006a, 2007, for discussion). For example, it can help us overcome our L1-based,

default processing strategies by facilitating the noticing of linguistic features that we would fail to perceive otherwise. It can also promote the process of “noticing the gap,” that is, when learners notice that the target language form is different from their own usage. Finally, explicit knowledge also plays an important role in the proceduralization and automatization of the L2, with conscious knowledge often guiding output practice, particularly in the initial stages of development.

Nick Ellis’s work has had great impact on the field of SLA. Through his research and publications, Ellis played a major role in establishing SLA as a cognitive science and in connecting SLA researchers with other cognitive scientists (see e.g., the contributions in the seminal collections: Ellis, 1994; Ellis & Larsen-Freeman, 2006a, 2009b; Robinson & Ellis, 2008). Many applied linguists will have first encountered key topics in cognitive science and neuroscience by reading Ellis’s review articles. Important examples include his publications on emergentism (e.g., Ellis, 1998, 2011a, 2011b), frequency effects (e.g., Ellis, 2002), and associative learning (e.g., Ellis, 2006b, 2006c). In addition, Ellis’s research has also had important implications for our understanding of L2 acquisition. His studies support emergentist accounts of language and demonstrate how constructions emerge from usage (e.g., Ellis & Ferreira-Junior, 2009; Ellis & Larsen-Freeman, 2009a). His work highlights the importance of frequency in language (Ellis & Schmidt, 1997, 1998; Ellis, 2002) and of explicit knowledge in promoting L2 development (Ellis, 2005). Finally, Ellis’s research also illustrates the central role played by learnt selective attention (e.g., Ellis & Sagarra, 2010) and associative learning processes in L2 acquisition (Ellis & Schmidt, 1997; Ellis, 2006b, 2006c).

Ellis, Rod

ROSEMARY ERLAM

Many readers will be familiar with Rod Ellis (1944–) as the author of a number of books in the area of second language acquisition, some of which they may well have on their bookshelves. The most ambitious of these, *The Study of Second Language Acquisition* (2008), presents an encyclopedic review of the field with which Rod's name has become synonymous. Rod's acclaim as a researcher and academic is, however, the end point of a professional career which encompasses three distinct stages, that of teacher, teacher educator, and, finally, researcher. In this respect it is a trajectory not unlike that followed by other applied linguists.

Teacher

Rod's career as a teacher began when he left the United Kingdom in 1965 with the aim of working and travelling overseas. Having recently completed a BA in English Literature at the University of Nottingham, teaching was an obvious choice and so he ended up teaching English at a Berlitz school in northern Spain. This work opportunity also gave him the chance to learn another language, Spanish, in a naturalistic setting. The experience contrasted dramatically with the more traditional way he had been taught German and French (under the translation method) and was to challenge ideas he had formed about language learning.

After four months in Spain Rod returned to London and took a job as a primary school teacher in London. He quickly learnt the need for effective classroom management and communication skills after the initial shock of finding himself with a class of "out of control" 10-year-olds. A year later, however, Rod was keen for some more overseas teaching experience and so took a position in a newly established secondary school in Zambia. From his point of view, it was the experience of a lifetime. The school was poorly resourced, with no electricity and few teaching materials, but the students were highly motivated and Rod joined a staff of other young teachers. One of these was Brian Tomlinson who, like Rod, was quick to identify a lack of suitable textbooks. Together they set about constructing their own grammar-teaching materials, which were eventually published as *English Through Situations* (1973). This was the first stage of Rod's lasting interest in textbook design.

Teacher Educator

Rod's teaching experience in Africa left him with a desire to pursue further study and so in 1970 he began an MA in Linguistics and Language Teaching at Leeds University. Following this he was appointed to a position as Lecturer at Nkrumah Teacher's College in Zambia. Thus began the second stage of Rod's career, that of language educator. Not long after beginning work at the Teacher's College Rod was joined by Brian Tomlinson and once again they enjoyed working together. The lectures that they gave to teacher trainees on the various aspects of teaching later became a co-authored book published in

1980, *Teaching Secondary English: A Guide to the Teaching of English as a Second Language in Africa*. Rod's contribution to this book was a distillation of his early knowledge of language teaching, gained from his professional experience and study. Rod is, in retrospect, quick to identify a number of gaps—for example, there is very little on how learners learn a second language, and nothing on learner autonomy or on the social and pragmatic aspects of language use.

Researcher

In 1978 Rod returned to the UK from Zambia and started another Master's, in Education, at Bristol University. This course opened up for him the world of second language acquisition and allowed him to familiarize himself with up-to-date research in the area. It also allowed him to develop skills in research and, more importantly, helped him discover that he wanted to be a researcher. A job as Senior Lecturer at St. Mary's College, Strawberry Hill, London, afforded Rod the opportunity to take the next logical step—that of doctoral study. In his PhD he was interested in whether instructed language learners manifest the same order and sequence of acquisition as naturalistic language learners, and in what ways the interactions that they are part of in the classroom impact on their L2 development. The thesis led to the publication of *Classroom Second Language Development* (1984). At the same time Rod started working on an introductory textbook on second language acquisition, the highly successful *Understanding Second Language Acquisition* (1985). This book is still in print, has been translated into several languages, and in 1995 won the first BAAL prize for the best book in Applied Linguistics.

In 1984 Rod was appointed Head of the ELT Department in the Ealing College of Education (now Thames Valley University). This position afforded him the opportunity to continue with his research and so he pursued a number of areas of interest which were influential in shaping understanding of second language acquisition processes. One of these was the role that interaction plays in L2 learning. Another was the variability of learner language, an interest which eventually led to a book called *Second Language Acquisition in Context* (1987). This interest was the forerunner of a project that Rod was to embark on nearly 20 years later—the Implicit and Explicit L2 knowledge research project. A third project, entitled "The acquisition of German in a classroom context," spearheaded another enduring research interest, that is, the relationship between individual learner factors (language aptitude, motivation, etc.) and language learning. It also gave Rod a first taste of the experience of conducting qualitative research; he became firmly convinced of the advantages of research that drew on both quantitative and qualitative traditions. A new book published around this time, *Instructed Second Language Acquisition* (1990), dealt with another theme that has remained of interest to Rod throughout his career: investigating how research could be applied to teaching practice.

In 1989 Rod moved to Temple University Japan (TUI) in order to teach courses on the Master's and Doctoral programs. This was also an opportunity for Rod to develop expertise in another area in which he has made a significant and highly successful contribution to the world of applied linguistics: he began to supervise doctoral students. Many of Rod's students have gone on to become well-known researchers in second language acquisition. During his time at Temple, Rod consolidated some of the ideas he had about grammar teaching and published what was to become a seminal article, "Second Language Acquisition and the Structural Syllabus" (1993). An enduring interest has been different approaches to focus on form in an instructional context.

While he was at Temple Rod published *The Study of Second Language Acquisition* (1994). This first edition was encyclopedic in its coverage of the field and comprised 824 pages,

61 of which were references. Its size represented the huge growth that had taken place in the field of second language acquisition since the publication of *Understanding Second Language Acquisition* in 1985. Henry Widdowson joked that it provided the reader with both mental and physical exercise. It went on to win the Duke of Edinburgh prize for the best book in applied linguistics of its year and was translated into Japanese and Chinese. At around the same time Rod published another textbook, *Let's Use English* (Ellis, Mbhele, Thembele, & Robinson, 1985–90), for primary school teachers in South Africa. This textbook drew on many of the ideas Rod had developed about language teaching through his study of and research in second language acquisition. It also enabled him to pursue further his interest in establishing links between theory and practice.

In 1993 Rod was appointed Professor in the School of Education at Temple University in Philadelphia, a position which necessitated a move to the USA. At Temple, Philadelphia, Rod was responsible for the TESOL program, teaching Master's-level courses and supervising doctoral students. His five years in Philadelphia were also extremely productive in terms of research and publications. He was able to continue with his already established interest and work in textbook writing, producing a series of graded readers and accompanying teacher guide for African primary school students, and co-writing an EFL textbook series, *Impact Grammar* (Ellis, Gaies, & Rost, 1998), for Asian students and a new English course for the West Indies, *Let's Work with English* (Ellis & Simmons, 2000). The *Impact Grammar* series was an opportunity for Rod to put his theoretical ideas about grammar teaching into practice. His book *SLA Research and Language Teaching* (1997a) presented and discussed a number of options for teaching grammar. It was also an opportunity for him to articulate the belief that research and theory should inform the practice of language teaching and vice versa. During this period Rod was invited to contribute to the Oxford Introductions to Language Study Series and the resulting text, *Second Language Acquisition* (1997b), is one that many readers are likely to be familiar with. The writing of it was a challenge in that Rod had to condense, into no more than 90 pages, an overview of the field he had previously taken over 800 pages to describe. This book has been very successful as an introductory textbook, however, and is still used today.

Research articles written by Rod around this time pointed to two growing areas of interest. The first of these was the role of interaction in classroom L2 acquisition, and the second was the use of tasks in the classroom. A later publication, *Task-based Language Teaching and Learning* (2003), allowed Rod to combine to some extent these two interests; it reflected his belief in the role that tasks could play in fostering the type of interaction that could lead to language learning. An edited volume was published later (*Planning in Task-based Performance*, 2005).

In 1998 Rod made a career move following an earlier visit to the Antipodes, where he had come to the conclusion that New Zealand was a place where he and his family could settle and be happy. He took over from Jack Richards as Professor and Director of the Institute of Language Teaching and Learning at the University of Auckland. Rod had the challenge and satisfaction of being instrumental in forming a new department, the Department of Applied Language Studies and Linguistics (DALSL), where he still holds the professorial chair.

A professional highlight for Rod in recent years has been a number of research projects that have allowed him to focus on and bring together his research interests. For example, a project looking at the incidental focus on form that can occur while learners are engaging in communicative tasks allowed him to combine his interests in classroom interaction and form-focused instruction. Another project, conducted with input from Cathie Elder, Shawn Loewen, and others, aimed to develop measures of implicit and explicit language knowledge and to use these measures to look at the effectiveness of different types of form-focused instruction and assess how these impact on language learning. This project

led to the publication of a co-authored book, *Implicit and Explicit Knowledge in Second Language Learning, Teaching and Testing* (2009). Another project looked at the effects of different types of written corrective feedback on L2 learning, contributing to the lively debate on the role that corrective feedback plays in L2 learning.

Recent years have also seen the publication of a number of highly successful books. Highlights include *Learning a Second Language through Interaction* (to which a number of Temple students contributed, 1999), *Form-focused Instruction and Second Language Learning* (2001), and, with Gary Barkhuizen, *Analyzing Learner Language* (2005).

When asked to reflect on his professional career, Rod comments that he feels extremely grateful for the opportunities he has had and the people that he has worked with. I am sure that those who know Rod and have worked with him would likewise express their gratitude but, in equal measure, their admiration.

Emergentism

NICK C. ELLIS

The Mysterious Process

Saussure (1916) characterized the units of language as linguistic signs, the signifiers of linguistic form and their associated signified functions, concepts, or meanings. In Saussure's view linguistic signs arise from the dynamic interactions of thought and sound—from patterns of usage: "what happens is neither a transformation of thought into matter, nor a transformation of sound into ideas. What takes place is a somewhat mysterious process by which 'thought-sound' evolves divisions, and a language takes place with its linguistic units in between these two amorphous masses" (pp. 110–11). Thus began structuralist linguistics, the study of language as a relational structure, whose elemental constructions derive their forms and functions from their distributions in texts and discourse. This approach had significant impact upon applied linguistics too. Fries, the founder of the English Language Institute at the University of Michigan, distinguished between lexical and structural meaning, with structural meaning concerning the patterns relating a particular arrangement of form classes to particular structural meanings. In this view, language acquisition is the learning of an inventory of patterns, as arrangements of words, with their associated structural meanings. Fries's (1952) *Structure of English* presented an analysis of these patterns. Harris, founder of the first US linguistics department at the University of Pennsylvania, developed rigorous discovery procedures for phonemes and morphemes based on the distributional properties of these units. For Harris, form and information (grammar and semantics) were inseparable. He proposed that each human language is a self-organizing system in which both the syntactic and semantic properties of a word are established purely in relation to other words, and that the patterns of a language are learned through exposure to usage in social participation (Harris, 1991).

Structuralism, the dominant approach in linguistics for the earlier part of the 20th century, was overtaken in the 1960s by generative approaches. Grammar became top-down and rule-governed, rather than bottom-up and emergent. It was modularized, encapsulated, and divorced from performance, lexis, social usage, and the rest of cognition. The analysis of linguistic structures as functional patterns and their "somewhat mysterious" emergence from usage was no longer pursued within generative linguistics.

Yet language and cognition are mutually inextricable; they determine each other. Language has come to represent the world as we know it; it is grounded in our perceptual experience. Language is used to organize, process, and convey information, from one person to another, from one embodied mind to another. Learning language involves determining linguistic structures from usage and this, like learning about all other aspects of the world, involves the full scope of cognition: the remembering of utterances and episodes, the categorization of experience, the determination of patterns among and between stimuli, the generalization of conceptual schemas and prototypes from exemplars, and the use of cognitive models, metaphors, analogies, and images in thinking. Language is used to focus the listener's attention to the world; it can foreground different elements in the theater of consciousness to potentially relate many different stories and perspectives about the same scene. What is attended is learned, and so attention controls the acquisition of language

itself. The functions of language in discourse determine its usage and learning. Language use, language change, language acquisition, and language structure are similarly inseparable. There is nothing that so well characterizes human social action as language. Cognition, consciousness, experience, embodiment, brain, self, and human interaction, society, culture, and history are all inextricably intertwined in rich, complex, and dynamic ways.

Despite this complexity, despite its lack of overt government, instead of anarchy and chaos, patterning pervades the complex system of language. The patterns are not pre-ordained by god, by genes, by school curriculum, or by other human policy, but instead they are emergent from the interactions of the agents involved—synchronic patterns of linguistic organization at numerous levels (phonology, lexis, syntax, semantics, pragmatics, discourse genre . . .), dynamic patterns of usage, diachronic patterns of language change (linguistic cycles of grammaticization, pidginization, creolization, . . .), ontogenetic developmental patterns in child language acquisition, global geopolitical patterns of language growth and decline, dominance and loss, need and education, etc.

Various disciplines within cognitive science (including cognitive psychology, child language studies, cognitive linguistics, corpus linguistics, and connectionism) focus upon their own local patterns of interest to try to understand the processes by which they come about. But above and beyond these particular specialties, other approaches (including emergentism, complex adaptive systems, and dynamic systems theory) recognize that there are general principles which characterize the emergence of patterns in complex systems whatever their content or scale. This entry will first consider some of the specific disciplines focusing upon the patterning of information and its creation in human mind, brain, culture, and society, before introducing the study of emergence itself. It concludes with a view of language as a complex adaptive system (CAS).

Local Perspectives Upon the Mysterious Process

An overview of the ways in which relevant disciplines are studying the origins of patterns in language can be conveniently organized by first focusing upon Saussure's linguistic sign. However effective, this does not imply that the structure of language is primary, far from it—we should look to meaning and social communication for that.

The closest modern parallel to the sign as a basic unit of language representation is the *construction* as studied broadly within approaches which fall under the general umbrella of *usage-based theories* of language acquisition, views which hold that we learn language incidentally while engaging in communication. Constructions are the fundamental units of language acquisition and reflect the most direct embodiment of learners' communicative intentions. Some of the basic tenets of usage-based approaches to language and its acquisition, many of them explicitly addressed by Saussure (1916), are:

- Language is intrinsically linked to human cognition and processes of perception, attention, learning, categorization, schematization, and memory.
- Language is intrinsically symbolic, constituted by a structured inventory of constructions as conventionalized form–meaning pairings used for communicative purposes.
- Adult language knowledge consists of a continuum of linguistic constructions of different levels of complexity and abstraction. Constructions can comprise concrete and particular items (as in words and idioms), more abstract classes of items (as in word classes and abstract constructions), or complex combinations of concrete and abstract pieces of language (as mixed constructions). Consequently, no rigid separation is postulated to exist between lexis and grammar.

- Constructions may be simultaneously represented and stored in multiple forms, at various levels of abstraction (e.g., concrete item: table+s = tables and [Noun] + (morpheme +s) = plural things).
- Linguistic constructions (such as the caused motion construction, X causes Y to move $Z_{\text{path/loc}}$ [Subj V Obj Obl]), e.g., “He pushed it along” or “Crotchety Aunt Gemima grumbled the baby up to bed”) can thus be meaningful linguistic symbols in their own right, existing independently of particular lexemes. Nevertheless, constructions and the particular lexeme tokens that occupy them resonate together, and grammar and lexis are inseparable.
- Language structure emerges ontogenetically from usage in particular contexts. Development is slow and gradual, moving from an initial heavy reliance on concrete items to more abstract linguistic schemas. This process is crucially dependent on the type and token frequencies with which particular constructions appear in the input. Storage of wholes depends on token frequency, schematization depends on type frequency.

Allied approaches researching the interplay of language and cognition concentrate upon broadly different facets of patterning (with some overlap at the intersections):

Cognitive linguistic analyses of language catalogue the inventory of the construction investigating the ways in which constructions are symbolic, their defining properties of morphological, syntactic, and lexical form being associated with particular semantic, pragmatic, and discourse functions (Croft & Cruise, 2004).

Corpus linguistic analyses of large collections of language show how there are recurrent patterns of words, collocations, phrases, and constructions, that syntax and semantics are inextricably linked, and that grammar cannot be described without lexis, nor lexis without grammar (Sinclair, 1991).

Construction grammar analyses of language show that much of communication makes use of fixed expressions memorized as formulaic chunks, that language is rich in collocational and colligation restrictions and semantic prosodies, and that the phrase is the basic level of language representation where form and meaning come together with greatest reliability (Goldberg, 2006).

Psychological analyses of *perception* investigate the ways in which human embodiment and our perceptuo-motor systems govern our representation of the world and the ways that language can guide our attention to these representations (Barsalou, 2008).

Associative learning theory analyzes how the learning of constructions as form-meaning pairings, like of all cue-outcome contingencies, is affected by: factors relating to the form such as frequency and salience; factors relating to the interpretation such as significance in the comprehension of the overall utterance, prototypicality, generality, redundancy, and surprise value; factors relating to the contingency of form and function; and factors relating to learner attention, such as automaticity, transfer, overshadowing, and blocking (Ellis, 2002, 2008b).

Cognitive theories of categorization and generalization analyze how schematic constructions are abstracted over less schematic ones that are inferred inductively by the learner in acquisition (Harnad, 1987). Prototypes, exemplars which are most typical of a category, are those which are similar to many members of that category and not similar to members of other categories. People more quickly classify sparrows (or other average-sized, average-colored, average-beaked, average-featured specimens) as birds than they do birds with less common features or feature combinations like geese or albatrosses. Prototypes are judged faster and more accurately, even if they themselves have never been seen before—someone who has never seen a sparrow, yet who has experienced the rest of the run of the avian mill, will still be fast and accurate in judging it to be a

bird. Such effects make it very clear that although people do not go around consciously counting features, they nevertheless have very accurate knowledge of the underlying frequency distributions and their central tendencies. The prototype emerges as the conspiracy of memorized exemplars.

Constructionist child language researchers gather dense longitudinal corpora in order to chart the emergence of creative linguistic competence in children's analyses of the utterances in their usage history and their abstraction of regularities within them (Tomasello, 2003).

Learning theory recognizes three major experiential factors that affect cognition: frequency, recency, and context (Anderson, 2000). Learning, memory, and perception are all affected by frequency of usage: the more times we experience something, the stronger our memory for it, and the more fluently it is accessed. The more recently we have experienced something, the stronger our memory for it, and the more fluently it is accessed. The more times we experience conjunctions of features, the more they become associated in our minds and the more these subsequently affect perception and categorization; so a stimulus becomes associated to a context and we become more likely to perceive it in that context. The power law of learning describes the relationships between practice and performance in the acquisition of a wide range of cognitive skills—the greater the practice, the greater the performance, although effects of practice are greatest at early stages of learning, thereafter diminishing and eventually reaching asymptote. The power function relating probability of recall (or recall latency) and recency is known as the forgetting curve. These three factors pervade the emergence, form, access, and processing of all mental representations.

Connectionist, competition, and rational models of language demonstrate the ways in which generalizations emerge from the conspiracy of memorized instances, the ways in which different cues and their cue reliabilities compete for activation, and the ways in which these representations provide the best model of language that is available from the learner's sample of experience, one that is optimized in its organization for usage (Bates & MacWhinney, 1987; Elman et al., 1996; Anderson & Schooler, 2000; Christiansen & Chater, 2001).

Psycholinguistic theories of the mental representation of language show that fluent language users are sensitive to the relative probabilities of occurrence of different constructions in the language input and to the contingencies of their mappings to meaning (Ellis, 2002; Gaskell, 2007).

Probabilistic and frequency-based theories of language analyze how frequency and repetition affect and ultimately bring about form in language and how probabilistic knowledge drives language comprehension and production (Bybee & Hopper, 2001). Distributional analyses of language also show the importance of Zipf's law (that the frequency of words decreases as a power function of their rank in the frequency table) at all levels in determining the structure and network characteristics of linguistic systems and the effects of these properties on learning (Ferrer i Cancho & Solé, 2001).

Sociocultural theory analyzes how language learning takes place in a social context, involving action, reaction, collaborative interaction, intersubjectivity, and mutually assisted performance, and how individual language learning is an emergent, holistic property of a dynamic system comprising many dialectic influences—social, individual, and contextual—involving the learner in a conscious tension between the conflicting forces of their current interlanguage productions and the evidence of feedback, either linguistic, pragmatic, or metalinguistic, that allows socially scaffolded development (Lantolf & Thorne, 2006).

The Scientific Study of Consciousness, its neural correlates, and its involvement in learning and memory (Koch, 2004) shows there are different forms of language learning; broadly, the implicit tallying and chunking that take place during usage (Ellis, 2002) and explicit

learning in the classroom, sometimes a consequence of communication breakdown (Ellis, 2005, sections 3–4). Implicit learning from usage occurs largely within modality and involves the priming or chunking of representations or routines within a module, with abstract schemas and constructions emerging from the conspiracy of memorized instances. It is the means of tuning our zombie agents, the menagerie of specialized sensori-motor processors that carry out routine operations in the absence of direct conscious sensation or control. It is largely automatized. It operates in parallel. In contrast, conscious processing is spread wide over the brain and unifies otherwise disparate areas in a synchronized focus of activity. Conscious activity affords much more scope for focused long-range association and influence than does implicit learning. It brings about a whole new level of potential associations. It operates serially. Consciousness too is dynamic; it is perhaps the prototype example of an emergent phenomenon: the stream of consciousness is one of ever-changing states, each cued by prior state and perceptual context, the units of consciousness being identifiable as patterns of brain synchrony in time. The dynamics of language learning are inextricably linked to the dynamics of consciousness, in neural activity and in the social world as well.

As these diverse research efforts illustrate, language usage involves agents and their processes at many levels, and we need to try to understand language emergence as a function of interactions within and between them. This is a tall order. Hence Saussure's "mysterious process" and his observations that

to speak of a "linguistic law" in general is like trying to lay hands on a ghost. . . . Synchronic laws are general, but not imperative. [They] are imposed upon speakers by the constraints of common usage. . . . In short, when one speaks of a synchronic law, one is speaking of an arrangement, or a principle of regularity. (pp. 90–1)

Nevertheless, a hundred years of subsequent work within the disciplines introduced above has put substantial flesh on the bones, as you will see if you follow up on the readings. And more recently, work within emergentism, CAS, and dynamic systems theory (DST) has started to describe a number of scale-free, domain-general processes which characterize the emergence of pattern across the physical, natural, and social sciences. The next section considers language in this light.

Common Mysteries of Emergence

Emergentism and complexity theory (Elman et al., 1996; Ellis, 1998; MacWhinney, 1999; Ellis & Larsen-Freeman, 2006; Larsen-Freeman & Cameron, 2008) analyze how complex patterns emerge from the interactions of many agents, how each emergent level cannot come into being except by involving the levels that lie below it, and how at each higher level there are new and emergent kinds of relatedness not found below: "More is different." These approaches align well with DST, which considers how cognitive, social, and environmental factors are in continuous interactions, where flux and individual variation abound, and where cause–effect relationships are nonlinear, multivariate and interactive in time (Ellis & Larsen-Freeman, 2006; de Bot, Lowie, & Verspoor, 2007; Ellis, 2008a).

Emergentists believe that simple learning mechanisms, operating in and across the human systems for perception, motor-action and cognition as they are exposed to language data as part of a communicatively-rich human social environment by an organism eager to exploit the functionality of language, suffice to drive the emergence of complex language representations. (Ellis, 1998, p. 657)

Language cannot be understood in neurological or physical terms alone, nevertheless—neurobiology and physics play essential roles in the complex interrelations; equally from the top down, though language cannot be understood purely by introspection, conscious experience is an essential part too.

Language considered as a CAS of dynamic usage involves the following key features.

- The system consists of multiple agents (the speakers in the speech community) interacting with one another.
- The system is adaptive; that is, speakers' behavior is based on their past interactions, and current and past interactions together feed forward into future behavior.
- A speaker's behavior is the consequence of competing factors ranging from perceptual mechanics to social motivations.
- The structures of language emerge from interrelated patterns of experience, social interaction, and cognitive processes.

The advantage of viewing language as a CAS is that it provides a unified account of seemingly unrelated linguistic phenomena including variation at all levels of linguistic organization; the probabilistic nature of linguistic behavior; continuous change within agents and across speech communities; the emergence of grammatical regularities from the interaction of agents in language use; and stage-like transitions due to underlying nonlinear processes.

Characteristics of Language as a CAS

The following are seven major characteristics of language as a CAS, which are consistent with studies in language change, language use, language acquisition, and with the computer modeling of these aspects, which is a core component of CAS research (The Five Graces Group, 2009).

Distributed Control and Collective Emergence

Language exists both in individuals (as idiolect) as well as in the community of users (as communal language). Language is emergent at these two distinctive but interdependent levels: an idiolect is emergent from an individual's language use through social interactions with other individuals in the communal language, while a communal language is emergent as the result of the interaction of the idiolects. Distinction and connection between these two levels is a common feature in CASs. Patterns at the collective level (such as bird flocks, fish schools, or economies) cannot be attributed to global coordination among individuals; the global pattern is emergent, resulting from long-term local interactions between individuals.

Intrinsic Diversity

In a CAS, there is no ideal representing agent for the system. Just as there is no ideal representative consumer in an economy; similarly, there is no ideal speaker-hearer for language use, language representation, or language development. Each idiolect is the product of the individual's unique exposure and experiences of language use (Bybee & Hopper, 2001). Sociolinguistics studies have revealed the large degree of orderly heterogeneity among idiolects, not only in their language use but also in their internal organization and representation.

Perpetual Dynamics

Both communal language and idiolects are in constant change and reorganization. Languages are in constant flux, and language change is ubiquitous (Hopper, 1987; Ellis, 2008a). At the individual level, every instance of language use changes an idiolect's internal organization. As we define language primarily through dynamical rules rather than by forces designed to pull it to a static equilibrium, it shares, along with almost all complex systems, a fundamentally far-from-equilibrium nature (Holland, 1995).

Adaptation Through Amplification and Competition of Factors

CASs generally consist of multiple interacting elements, which may amplify and/or compete with one another's effects. Structure in complex systems tends to arise via positive feedback, in which certain factors perpetuate themselves, in conjunction with negative feedback, in which some constraint is imposed (for instance, due to limited space or resources). Likewise in language, all factors interact and feed into one another.

Nonlinearity and Phase Transitions

In complex systems, small quantitative differences in certain parameters often lead to phase transitions, that is, qualitative differences. Elman (2005) points out that multiple small phenotypic differences between humans and other primates (such as in degree of sociability, shared attention, memory capacity, rapid sequencing ability, vocal tract control, etc.) may in combination result in profound consequences, allowing means of communication of a totally different nature. Also, in a dynamic system, even when there is no parametric change, at a certain point in a continuous dynamic, system behavior can change dramatically, going through a phase transition. For example, constant heating of water leads to a transition from liquid to gas without having any parametric change. In language development, such phase transitions are often observed, for example developmental "lexical spurts" which often lead to rapid grammatical development (Bates & Goodman, 1997).

Sensitivity to and Dependence on Network Structure

Network studies of complex systems have shown that real-world networks are not random, as was initially assumed, and that the internal structure and connectivity of the system can have a profound impact upon system dynamics (Barabási, 2002). Similarly, linguistic interactions are not via random contacts; they are constrained by social networks. The social structure of language use and interaction has a crucial effect in the process of language change, and language variation and the social structure of early humans must also have played important roles in language origin and evolution.

Change is Local

Complexity arises in systems via incremental changes, based on locally available resources rather than via top-down direction or deliberate movement toward some goal. Similarly, in a complex systems framework, language is viewed as an extension of numerous domain-general cognitive capacities such as shared attention, imitation, sequential learning, chunking, and categorization. Language is emergent from ongoing human social interactions, and its structure is fundamentally molded by the preexisting cognitive abilities, processing idiosyncrasies and limitations, and general and specific conceptual circuitry of the human brain. Because this has been true in every generation of language users from its very origin, in some formulations language is said to be a form of cultural adaptation to the human mind rather than the result of the brain adapting to process natural language

grammar (Christiansen & Chater, 2008). These perspectives have consequences for how language is processed in the brain. Specifically, language will depend heavily on brain areas fundamentally linked to various types of conceptual understanding, the processing of social interactions, and pattern recognition and memory. It also predicts that so-called “language areas” should have more general, prelinguistic processing functions even in modern humans and, further, that the homologous areas of our closest primate relatives should also process information in ways that makes them predictable substrates for incipient language. Additionally, it predicts that the complexity of communication is to some important extent a function of social complexity. Given that social complexity is in turn correlated with brain size across primates, brain size evolution in early humans should give us some general clues about the evolution of language. Recognizing language as a CAS allows us to understand change at all levels.

Future Directions: Dynamic Structure

As the diverse research cited in this entry illustrates, understanding the emergence of language requires the full range of techniques of cognitive, social, and natural science. But more than that, it requires an overarching framework of emergentism, CAS, and DST.

A common opposition within linguistics is the contrast between Saussure and Vygotsky, between structuralist approaches to language and those that emphasize the processes of language use in social interaction, between thin and thick descriptions. Vygotsky's (1935/1986) *Thinking and Speaking* addresses that same mystery as Saussure's, and makes equal resort to metaphor; for example, “Consciousness is reflected in the word like the sun is reflected in a droplet of water” (p. 285). “The relation between thought and word is a living process; thought is born through words. A word devoid of thought is a dead thing, and a thought unembodied in words remains a shadow. The connection between them, however, is not a preformed and constant one. It emerges in the course of development, and itself evolves” (p. 255). Language emerges both in the Saussurian sign and the Vygotskian process.

Language and usage are like the shoreline and the sea.

Emerging Technologies for Language Learning

ROBERT GODWIN-JONES

It's not possible to predict with any degree of certainty future developments in hardware and software and what they might mean for language learning. However, for the short term, there are trends which seem to point in likely directions. Several of these hold promise for enhancing language learning, but this entry will focus on the expansion of computing environments, which brings with it new options in network services and applications, as well as interesting collaborative opportunities. The current trends tend to converge in a likely scenario featuring a customized learning environment, ubiquitous access to learning materials/services, and extensive peer-to-peer learner networking.

Enhanced Mobile Devices

Desktop operating systems continue to develop and evolve, with new features making their appearance in each iteration. Of particular interest for language learning, however, is the emergence of operating systems for mobile devices, as they add new and powerful capabilities to both individualized and collaborative learning. Microsoft and Apple have slimmed-down versions of their operating systems for mobile devices—Windows Mobile and the iOS respectively. At the same time, operating systems designed from the outset to run on portable devices have emerged, including Android from Google and webOS from Palm. The most recent devices using advanced mobile operating systems feature improved Web access (mostly using the Apple-created WebKit), advanced multimedia (including nonstuttering video playback and video editing) and built-in social networking (with mobile versions of services such as Twitter and Facebook). They offer instant-on capabilities, both Wi-Fi and cellular network access, and touch screens with excellent readability for text and viewing for video. They also run on much faster 3G/4G networks, which greatly enhance data transfer for interactive programs and streaming media. Most also offer some degree of multitasking, or at least pop-up notifications, which allow collaboration and communication tools to interact with the user, even when another program is running in the foreground. Smartphones have in effect transitioned into fully capable hand-held computers.

A significant aspect of the new functionality of recent mobile devices comes from their extensibility, through the addition of third-party applications. The companies offering this service handle it in different ways. Most have created a software-development kit (SDK) which allows developers to create new programs or adapt existing programs. Developers have created a sizable number of applications ("apps") for the Apple iPhone, including a good number which feature language-learning tools or services such as dual-language dictionaries, grammar references, audio phrase books, flashcard programs, enhanced podcast access, or writing tutors. Given their popularity, we are likely to see many more apps created for major mobile platforms.

Web Applications

Unfortunately, there are no standards for development of mobile applications, so that an app written for the iPhone (which uses Objective C for coding) will not run on an Android device (which relies on Java as its programming language). There is, however, an approach to creating mobile apps which will run on virtually any smartphone as well as on other devices which feature a full-functioning Web browser (i.e., supporting the latest formatting and scripting Web standards). This involves creation of a Web application, using an approach often called AJAX, which stands for asynchronous JavaScript and XML. This method uses commonly accepted and implemented Internet standards, with the user interface and interactivity relying on the HTML document object model (DOM) and cascading style sheets (CSS). This approach allows the app to take full advantage of Web services, including pulling information from a server in the background. With the arrival of enhanced Web page interactivity through the new version of the Web authoring language, HTML 5, AJAX Web apps will become even more attractive and powerful. An AJAX application for language learning will run on both desktop and mobile devices and is more universally compatible than an application built on a proprietary format such as Adobe Flash or Microsoft Silverlight, which require browser plug-ins that may not be available for all platforms.

The use of AJAX overcomes the “stateless” aspect of the Web, that is, no persistent connection to the server. The retrieval of XML data in the background is transparent to the user and results in interactions running much more efficiently, as the Web application does not have to wait each time server-based data is needed. One could envision an AJAX program for language learning which relies on access to an online dictionary, text collection, or other data set, preloaded for fast access. This might be used for ready access to text annotations or to bring in supplemental data such as graphics or audio. AJAX could also be a good approach in building an application based on a language corpus. A concordancing program, for example, could display a subset of results from a searched term, while retrieving but holding in reserve additional results. Another interesting example of an AJAX program is the Google Language API, which offers language detection, transliteration, and translation. It currently supports 85 different languages and 29 language pairings. There are many open-source AJAX libraries available which ease considerably the creation of Web applications. The OpenAJAX Alliance is working to improve compatibility across these different libraries. It should be mentioned in this context that Google has made its Android OS openly and freely available to device manufacturers, which has created a good deal of interest in Android development, given the fact that the OS is appearing in a variety of devices from phones to tablets.

Universal Syncing and Media Creation

Being able to access a language-specific data set would be a significant boon to language learning. Equally promising is the ability to sync automatically a student’s progress in a language-learning program, especially where this features an intelligent language tutor (ILT). An ILT is a sophisticated piece of software that uses natural language processing (NLP) to analyze learner input. An ILT often also incorporates automatic speech recognition (ASR), which recognizes and processes users’ spoken input. Such programs have progressed considerably in recent years and take full advantage of advances in fields such as second language acquisition, speech technologies, and computational linguistics. An ILT creates an interaction with a learner, which could range from a simple pronunciation drill to a full-sentence response to a question. The simpler the spoken input and the more restricted

the language context, the more likely it is that the language will be processed correctly and appropriate feedback supplied. At the same time, systems have been developed which strive to evaluate not only accuracy of language use, but also harder to quantify features such as complexity or fluency (Gamper & Knapp, 2002). The US Army has deployed a sophisticated ILT for mobile devices to provide assistance in understanding spoken Arabic. As processors on consumer-level mobile devices become more powerful, this kind of advanced language learning technology is likely to become more widely developed and used.

Programs which feature an ILT normally include a learner profile, which tracks the student's progress, maintaining a learning history which may include learner-specific goals and preferences (Heift, 2005). An AJAX ILT running on a smartphone could first check the learner profile on the server, loading needed parts of that user's profile into memory and returning the learner to the previous stopping point. There are programs currently available which feature this type of automatic syncing, such as the Amazon Kindle, which can sync reader data on multiple devices, taking the reader back to the last page read no matter what device is being used. The Palm's latest phone offers automatic Facebook syncing, and we are likely to see more complete syncing of social networking services on all platforms. This kind of data syncing is likely to become more important as learners accumulate more electronic gadgets capable of accessing the Internet. Companies are recognizing this need and creating syncing services such as Windows Live (Microsoft) or MobileMe (Apple).

Mobile devices now feature multiple communication options. Some, such as the iPhone, incorporate a virtual keyboard which offers text entry in multiple languages, as the touch screen keyboard can be changed easily from one layout to another. This is a particularly important feature for non-Latin alphabets such as Russian, Chinese, or Arabic. A touch screen can also accommodate handwritten input, which enables entering ideographs or pictographs. Switching the keyboard on an iPhone also changes the associated dictionary, which is used for auto-correction of text entry. Devices such as the iPhone and Android phones also feature voice recognition. While this is usually limited to specific applications, software extensions are becoming available which allow for incorporation of voice recognition into third-party apps. This feature, along with the voice synthesis usually accompanying it, is of significant interest to language learners, as one could envision a virtual conversation partner (once speech technologies become more widely available and reliably robust). Of course, audio recording is also possible on smartphones and other devices. This could function as a means for learners to record dialogs they might encounter in a study-abroad environment or to create podcasts for peer sharing.

Other features of new mobile devices offer equally intriguing possibilities for language learning. For example, the higher-quality cameras now incorporated into smartphones, allow for high-quality still-image and video capture. The new option of having multimedia production on what amounts to a hand-held computer means that the images can be uploaded to servers, but they can also be used in collaborative learning environments, such as language exchanges, field assignments, or study abroad. The GPS (global positioning system) capability adds geo-tagging to the mix and enables interesting possibilities for group dynamics based on location. This could take advantage of the location-aware social networking apps which have proliferated on mobile devices. One can add to that the possibility of creating mash-ups using overlays of freely available map data such as Google Maps. This could add a whole new dimension to studying and interacting with cultural sites. A 2008 study details use of GPS, cameras and mobile messaging for Chinese language learning (Anderson, Hwang, & Hsieh, 2008). The combination of location and communication capabilities could also make for a compelling environment for online learning games.

Cloud Computing and Widgets

The collaborative opportunities for language learners on all kinds of devices are enhanced by the availability of “cloud” resources. Cloud computing is the generally accepted term for services and applications which reside on Internet-accessible servers rather than on local machines and are made available on an on-demand basis. Many companies have created programs or services which rely on cloud access, including text editors, imaging programs, and even audio editing programs. Microsoft has adapted its bastion of desktop productivity, the Office Suite, to the cloud, as is the case as well for the well-known imaging application from Adobe, Photoshop. The advantage over local applications is the ability to access one’s data and programs from a variety of locations and devices. Another crucial feature is sharing. Many of the cloud-based programs, such as Google Apps, were created with sharing as a major component. Using Google Apps, or similar services, it is easy to collaborate with the designated users or groups. Google Wave adds live synchronous sharing of text as well as of other media. Google, in fact, has been one of the foremost users of cloud computing, even creating a new operating system, Chrome, which relies on cloud access.

A concern with this approach is the necessity of ubiquitous Net access in order to access data or services. A component of the new HTML 5 will help to alleviate that problem. It allows for local storage of data that goes considerably further than the current browser storage capability, which uses Web “cookies,” a system of key-value pairs stored locally as text strings. The new Web or DOM storage allows for saving data in an array, similar to the way HTML cookies are structured, but allows for much greater storage capacity. Also possible will be saving data to a lightweight local database. HTML 5 will add other features of potential interest to language learners and application developers, including the ability to stream audio and video without the need for a plug-in, as well as for timed media playback. The latter enables easier creation of applications which sync text or annotations with audio or video clips. It also supports drag-and-drop across all elements of the document object model, as well as standardizing in-browser rich-text editing. Google Wave was created as an HTML 5 application.

Applications residing in the “cloud” point to another trend—the multiplicity of applications the average user accesses from a variety of sources and vendors. Just as the monolithic operating systems are being joined by smaller, focused systems, the same is true for big computer applications. They are being supplemented, or in some cases even replaced, by small, single-purpose applications, often called widgets. These are applications created in Adobe Flash or using standard HTML/JavaScript, which can offer services such as online dictionary look-up, direct access to a social networking services, podcast listening, or viewing of announcements or other data pulled from a learning-management system. Language teachers are increasingly creating their own Web-based language-learning environments by collecting and displaying widgets on a page using services such as Netvibes, Pageflakes, or iGoogle. These are sometimes referred to as personal learning environments (PLE). They feature a great deal of flexibility in customization, as widgets can be dragged to a desired location or even from one Web page to another. A PLE for language learning might include widgets for chat, discussion forums, dictionary/encyclopedia lookup, course calendars, social bookmarking, a writing tool, media player, or foreign news feeds. They can also include such features as online quizzes and access to cloud-based file storage.

These tools provide an inexpensive and more flexible alternative to learning-management systems (also called virtual learning environments) such as Blackboard, the largest commercial vendor of such services. They also allow learners to create their own customized learning environments based on accumulating just those tools and services they find useful. Paralleling this development has been the rise of more flexible learning-management

systems, especially Moodle, which has attracted many users with its modular architecture, encouraging development of multiple add-on modules. The fact that it is open source has helped it gain popularity. Some have argued that it is this personalized, more open approach of the PLE that represents the future of language-learning technology, not the highly structured ILT (Wild, Mödritscher & Sigurdarson, 2008). At any rate, the trend toward greater learner autonomy seems to be accelerating as language learners continue to pursue learning opportunities outside the classroom and seek opportunities for language maintenance. More and more they are accessing those resources on the Internet and using smaller and smaller devices to do so.

Emic and Etic in Qualitative Research

NUMA MARKEE

The origins of the emic/etic distinction in linguistics are to be found in Pike (1967), who distinguished between *phonemic* and *phonetic* accounts of the sounds of language. As originally formulated, *phonemic* accounts are *member-relevant* rules about the sound contrasts of language that native speakers have inside their heads, while *phonetic* accounts are *researcher-relevant* distinctions about how these sounds are observably realized by native speakers. In modern ethnographic and conversation analytic interpretations of the emic/etic distinction (though not in Pike's original formulation: see Pike, 1967, pp. 38 & 39), emic, qualitative research precedes etic, quantitative research. As Watson-Gegeo (1988) puts it: "Ethnographic analysis is not exclusively emic. Rather, a carefully done emic analysis precedes and forms the basis for etic extensions that allow for cross-cultural or cross-setting comparisons" (Watson-Gegeo, 1988, pp. 580–1).

Unlike quantitative research, which is relatively unified in terms of its goals and procedures, qualitative research is comparatively heterogeneous in its aims and methodologies. For example, the guidelines for quantitative and qualitative research published in *TESOL Quarterly* (2003, pp. 157–78) contain a single entry for quantitative research, and three separate entries for *case study research*, *conversation analysis* (CA), and (*critical*) *ethnography* under the general rubric of qualitative research (see each entry for useful references pertaining to each of these subfields of qualitative research). Furthermore, note that these three examples constitute a very conservative list of bona fide qualitative methodologies: arguably, there should also be entries for, say, *ethnomethodology*, *hermeneutics*, *life histories*, *diary studies*, *content analysis*, and *survey research*, among other potential candidates.

While these examples of qualitative research are emic in the broad sense that they all invoke a participant's perspective as their point of analytic departure, it is important to realize that there are subtle differences in how this point of view is interpreted, particularly by ethnographers and conversation analysts. So, for example, Watson-Gegeo (1988, p. 576) notes that ethnography derives from anthropology and defines ethnography as "the study of people's behavior in naturally occurring settings, with a focus on the cultural interpretation of behavior." Furthermore, she identifies four principles of ethnographic research (pp. 577–9). More specifically, ethnography: a) focuses on the culturally contextualized behavior of groups of individuals; b) seeks to link the microcontext of, for example, classroom talk, to the macrocontext of a school, district, and society; c) is guided by a theoretical framework which frames the kinds of situations and research questions that researchers ask themselves; and d) seeks to understand a situation in its own terms as a means of generating grounded (i.e., emic) theory.

In contrast, CA is derived from a radical form of sociology founded by Garfinkel (1974). As Roger and Bull (1988) explain, Garfinkel coined the neologism "ethnomethodology" by combining the words "ethno" and "methodology" based on terms such as "ethnobotany" and "ethnomedicine," which refer to folk systems of botanical and medical analysis, respectively. More specifically, the term "ethnomethodology" "refers to the study of the ways in which everyday commonsense activities are analyzed by participants, and of the ways in which these analyses are incorporated into courses of action" (Roger & Bull, 1988, p. 3). These authors then go on to point out that CA has emerged as the most influential

development within ethnomethodology, and that CA has also made important contributions to psychology, linguistics, and anthropology. On this reading, CA seeks to explain how, during the course of naturally occurring “talk-in-interaction” (i.e., ordinary conversation and institutional talk: see Schegloff, 1987) participants orient to the practices of turn taking, repair, and conversational sequencing, and also to the preference organization of adjacency pairs and repair sequences, as resources for the co-construction of talk in real time (Hutchby & Wooffitt, 2008). Thus, as I have already noted, ethnography and CA both share an interest in explicating how participants understand naturally occurring courses of action. However, there are major differences between these two disciplines in terms of how they handle culture, context, and the role of theory in emic knowledge construction.

Let us now investigate how these three notions are understood in ethnography and CA: First, as we have already seen, Watson-Gegeo’s third emic principle of ethnography is that ethnographers are guided by a theoretical framework which frames the kinds of situations and research questions that they ask themselves. In contrast, CA adopts a perspective on what constitutes emic research which is epistemologically much more radical. For example, conversation analysts are not only “ethnomethodologically indifferent” (Garfinkel & Sacks, 1970, p. 63) toward a priori theories of social science (such as, for example, SLA), but they also regard theory as a *by-product* of empirical analysis (Markee, 2008).

Second, the role of context—which is probably one of the most contentious concepts in linguistics, anthropology, and sociology—is understood quite differently by ethnographers and conversation analysts. Part of the difficulty here is that, as Goodwin and Duranti (1992) point out, there is no widely accepted consensus regarding how to conceptualize context. However, by and large, ethnographers tend to invoke a broad range of macro- and micro-sociocultural factors (which, in descending order, might include the economic, political, social, educational, institutional, and classroom context of, say, gendered pedagogical talk) in order to understand a particular course of action. In contrast, conversation analysts tend to argue that talk functions as its own context. So, for example, Heritage (1988) argues that social order is to be found in the minutest details of talk-in-interaction and goes on to make the case that conversation analyses are simultaneously (and without contradiction) both context *shaped* and context *renewing*. That is, current talk is not only *shaped* by the talk that immediately precedes it, it also sets up a new sequential context through which speakers *renew* (i.e., maintain, adjust, or alter) their understandings of what happens in the next turn. This highly localized understanding of talk-as-its-own-context is obviously controversial from an ethnographic perspective and has given rise to the so-called “cultural critique” of CA (see Maynard, 2003, pp. 68–70), which, in brief, criticizes this notion of context as being far too limited (see, for example, Moerman, 1988). But in his counter-critique of ethnographic notions of context, Schegloff (1987, 1991) strongly argues that any appeals to ethnographic context to explicate talk-in-interaction must be grounded in the observable *relevance* that a particular piece of information has for *those* participants engaged in *that* piece of talk. In addition, Schegloff further suggests that analysts must be able to demonstrate the *procedural consequences* that these pieces of information have for the way in which the details of talk-in-interaction are analyzed. Given these respective positions, it is not surprising to find that whereas ethnographers routinely seek to show how different concentric circles of context are intertwined with each other, conversation analysts are wary of making any such macro/micro interconnections.

Finally, discussions regarding the role of culture in the two disciplines are beset by similar problems of definition and by arguments about what the scope of culture is. So, for example, Duranti (1997) reviews no less than six different perspectives on what culture is (these perspectives include formulations of culture as: a) distinct from nature; b) knowledge; c) communication; d) a system of mediation; e) a system of practices; and f) a system of participation). However, he refrains from providing a definition of his own

that synthesizes core characteristics from these different viewpoints. In contrast, culture in ethnomethodological CA is treated in a way that is reminiscent of the way in which context is treated in this discipline. So, for example, Benson and Hughes (1991) propose that any analysis of talk-in-interaction “in terms of the ‘mechanism’ by which that talk was produced *there* and *then*, is an explication of some part of culture” (Benson & Hughes, 1991, p. 130; emphasis in the original).

Thus, conversation analysts not only avoid invoking a priori etic theory as a means of framing their analytic interests, they also subscribe to the limited versions of context and culture discussed above. This has the further consequence that conversation analysts and ethnographers tend to have qualitatively quite different understandings of what constitutes an emic perspective on research. More specifically, while ethnographers often equate the use of an emic approach with *developing empathy with*, and *giving voice to*, participants, CA typically approaches the task of developing an emic account of language behavior in a more *technical* fashion. This stance famously prompted Moerman (1988, pp. x–xi) to rebuke CA for its preoccupation with the “dry bones” of talk, and for its “bloodless” and “impersonal” approach to “richly experienced human reality.” As we have already seen, however, the ethnographic position on context and culture is vulnerable to the charge that, in their quest to capture the essence of richly experienced human reality, ethnographers ultimately have to rely on a methodologically unspecifiable notion of privileged access to what fundamentally constitutes our everyday humanity. Clearly, this debate is unlikely to end any time soon.

Conclusions

In summary, I have tried to demonstrate in this entry that while etic (quantitative) research is relatively homogeneous, emic (qualitative) research is much more heterogeneous in its ontological and epistemological assumptions. I have illustrated this idea by concentrating on the different meanings that the concept of “emicness” hold for ethnographers and conversation analysts. From the perspective of somebody who has carried out both ethnographic and conversation analytic research (see Markee, 1997, 2000, respectively), I am very comfortable saying that ethnographers and conversation analysts are clearly on the same side of the epistemological divide vis-à-vis the uniformly etic notions of experimental research. However, it is important to understand that there are also important differences within the broad church of qualitative research. Ultimately, ethnographers are interested in developing broad, integrated answers to “Why” type questions about the ways in which we live our lives. In contrast, conversation analysts ask “How” type questions about the ways in which we make sense of everyday courses of action. Both these quests are “emic” in nature, but it is important for applied linguists to understand that different questions lead to potentially quite different answers.

Empowerment and Bilingual Education

JIM CUMMINS

In educational discourse, the term *empowerment* has been used predominantly in the context of discussions of equity and social justice. Paulo Freire's (1970) influential volume, *Pedagogy of the Oppressed*, highlighted the intersections between education and societal power relations and articulated pedagogical and social strategies for confronting the oppressive influence of these power relations. Freire's analysis gained credibility from the fact that it was grounded in his efforts to create conditions for the development of literacy among Brazilian peasants by enabling them to think about the social conditions within which their work was embedded. Through a process of "conscientization," learners developed awareness about how oppressive societal power relations affected their lives and their emerging literacy skills enabled them to challenge the operation of these power relations.

Since then, numerous educational theorists have built on Freire's work to analyze the ways in which school failure is manufactured among marginalized students. The starting point for this analysis of student achievement is the assertion that societal power relations are relevant to all aspects of education (funding, curriculum, assessment, language of instruction, etc.). This may seem like an obvious or even trivial observation until one realizes that government-sponsored educational reform efforts in countries around the world, both historically and currently, have largely avoided reference to societal power relations as in any way relevant to student achievement. They have instead focused on "neutral" issues such as how effectively the curriculum is delivered by teachers or whether appropriate approaches to teaching reading have been implemented.

Theory and research focused on empowerment assumes relevance for bilingual education as a consequence of the fact that bilingual programs for linguistic minority students have frequently been implemented with the goal of increasing students' educational achievement. For example, in the USA, bilingual programs for Spanish-speaking students were initiated in the late 1960s in the context of the Civil Rights movement and subsequent federal legislation mandating equality of educational opportunity. It was assumed that the mismatch between the language of the home and the language of schooling contributed to students' educational difficulties. Thus, reducing this gap by means of (typically short-term) transitional bilingual education seemed to make sense as a strategy for increasing students' access to the curriculum.

This "linguistic mismatch" rationale for bilingual education has been critiqued as very much over simplified and inadequate to explain the empirical data (e.g., Cummins, 1979, 2001). It assumed that the causes of minority groups' educational difficulties lay in linguistic differences between home and school but ignored the fact that under different social and educational conditions linguistic mismatch did not impede students' academic progress. For example, no adverse effects of linguistic mismatch are evident in the outcomes of second language immersion programs for majority group students (e.g., Cenoz, 2009). Also, many groups of immigrant students from middle-class backgrounds perform well academically despite the fact that their home language (L1) is different from the language of the school (L2).

Explanatory frameworks that have attempted to go beyond linguistic mismatch have tended to invoke factors associated with societal power relations that affect not just

2 EMPOWERMENT AND BILINGUAL EDUCATION

linguistic minority students but all marginalized students. Gloria Ladson-Billings (1995) expressed the essence of these frameworks as follows: "The problem that African-American students face is the constant devaluation of their culture both in school and in the larger society" (p. 485). Empowerment, as an educational goal, is therefore explicitly aimed at challenging the devaluation of students' language and culture within the school and wider society.

One obvious way of challenging the devaluation of bilingual students' language and culture is to incorporate students' language as a medium of instruction within the school. Thus, bilingual programs automatically confer symbolic status and economic opportunities (e.g., teaching positions) for members of linguistic minority groups. However, not all bilingual programs are created equal with respect to their potential to create contexts of empowerment for linguistic minority students and communities. Some short-term or quick-exit transitional programs do not aim to develop bilingualism and biliteracy but simply use students' L1 as a bridge to English. The message to students and communities about the value of their culture and language may not be much more affirming than that communicated in monolingual programs.

In the sections that follow, the research on bilingual education is reviewed and the relationship of bilingual education to empowerment is elaborated. The central point to be made is that empowerment and the affirmation of student identities are promoted by a range of pedagogical factors, only one of which is the school's orientation to students' language and culture. Thus, bilingual education, by itself, is not a panacea for reversing underachievement if other aspects of students' schooling experience are not focused on empowerment.

Bilingual Education: What the Research Says

Although bilingual education has evoked considerable controversy in a number of countries (e.g., Esser, 2006), this public controversy contrasts with the considerable consensus among applied linguists regarding the outcomes of such programs. The research on bilingualism and bilingual education supports the following four conclusions:

1. *Bilingual programs for minority and majority language students have been successfully implemented in countries around the world.* The research on the effects of bilingual education for both minority and majority group students is unequivocal in demonstrating that well-implemented bilingual programs represent a legitimate policy option both to develop bilingual and biliterate skills and to promote students' academic achievement. Francis, Lesaux and August (2006), writing as members of the National Literacy Panel on Language-Minority Children and Youth (August & Shanahan, 2006) summarized their review as follows:

In summary, there is no indication that bilingual instruction impedes academic achievement in either the native language or English, whether for language-minority students, students receiving heritage language instruction, or those enrolled in French immersion programs. Where differences were observed, on average they favored the students in a bilingual program. The meta-analytic results clearly suggest a positive effect for bilingual instruction that is moderate in size. This conclusion held up across the entire collection of studies and within the subset of studies that used random assignment of students to conditions (Francis, Lesaux, & August, 2006, p. 397).

2. *The development of literacy in two languages entails linguistic and perhaps cognitive advantages for bilingual students.* A large number of research studies carried out since the early 1960s

report significant advantages for bilingual students on a variety of metalinguistic and cognitive tasks. Bilingual students get more practice in learning language (by definition) and this seems to sharpen their awareness of subtleties of linguistic meaning and form (see Bialystok, 2001 for a review).

3. *Significant positive relationships exist between the development of academic skills in L1 and L2.* This is true even for languages that are dissimilar such as Spanish and Basque (Cenoz, 2009). These cross-lingual relationships provide evidence for a common underlying proficiency or linguistic interdependence that permits transfer of academic and conceptual knowledge across languages. This transfer of skills and knowledge explains why spending instructional time through a minority language entails no adverse consequences for the development of the majority language. The research evidence for interdependence is summarized by Dressler and Kamil (2006) as part of the Report of the National Literacy Panel on Language-Minority Children and Youth (August & Shanahan, 2006). They conclude:

In summary, all these studies provide evidence for the cross-language transfer of reading comprehension ability in bilinguals. This relationship holds (a) across typologically different languages . . . ; (b) for children in elementary, middle, and high school; (c) for learners of English as a foreign language and English as a second language; (d) over time; (e) from both first to second language and second to first language. (Dressler & Kamil, 2006, p. 222)

4. *The most successful bilingual programs are those that aim to develop bilingualism and bilit-eracy.* This conclusion was supported by a major review of the US research literature (Genesee, Lindholm-Leary, Saunders, & Christian, 2006):

There is strong convergent evidence that the educational success of ELLs [English language learners] is positively related to sustained instruction through the student's first language. . . . most long-term studies report that the longer the students stayed in the program, the more positive were the outcomes. (Lindholm-Leary & Borsato, 2006, p. 201)

In summary, the research on bilingual education demonstrates unequivocally that instruction through a minority language in the context of a bilingual program entails no adverse effects on students' academic development in the majority language. In fact, the trend is towards stronger academic performance by students in bilingual programs in comparison to those in monolingual programs.

The data, however, clearly show that far more than just medium of instruction is involved in reversing school failure. Specifically, it has been argued that intervention to address the real causes of underachievement among marginalized minority group students must take account of how societal power relations are translated into teacher-student interactions within the classroom (Cummins, 2001; García, 2009).

Empowerment as the Collaborative Creation of Power

Extensive research has been carried out by sociologists and anthropologists on issues related to ethnicity and educational achievement (e.g., Ogbu, 1978, 1992; Skutnabb-Kangas, 2000; McCarty, 2005; Bishop & Berryman, 2006). These studies point clearly to the centrality of societal power relations in explaining patterns of minority group achievement. Groups that experience long-term educational underachievement tend to have experienced material and symbolic violence at the hands of the dominant societal group over generations. A

direct implication is that in order to reverse this pattern of underachievement, educators, both individually and collectively, must challenge the operation of coercive relations of power in the classroom.

A framework proposed by Cummins (2001) explicitly links empowerment to bilingual education. This framework argues that within a societal context of unequal power relations, classroom interactions are never neutral—they are always located on a continuum ranging between the reinforcement of coercive relations of power and the promotion of collaborative relations of power. Coercive relations of power refer to the exercise of power by a dominant individual, group, or country to the detriment of a subordinated individual, group, or country. For example, in the past, dominant group institutions (e.g., schools) have required that subordinated groups deny their cultural identities and give up their languages as a necessary condition for success in the “mainstream” society.

Collaborative relations of power, by contrast, reflect the sense of the term *power* that refers to “being enabled,” or “empowered” to achieve more. Within collaborative relations of power, power is not a fixed quantity but is generated through interaction with others. The more empowered one individual or group becomes, the more is generated for others to share. The process is additive rather than subtractive. Within this context, *empowerment* can be defined as *the collaborative creation of power*. Students whose schooling experiences reflect collaborative relations of power know that their voices will be heard and respected within the classroom. Schooling opens up identity options and amplifies rather than silences their power of *self-expression*.

Within this theoretical context, the crucial variable in predicting the extent to which any educational program or intervention will increase the academic achievement of minority group students is not simply whether L1 is incorporated into the instructional program but rather the extent to which the teacher–student interactions generate a sense of empowerment among the students. When the goal is to affirm students’ identities and promote strong bilingual and biliteracy development, L1 incorporation is likely to contribute to the collaborative creation of power. However, quick-exit transitional programs are unlikely to create contexts of empowerment for bilingual students. By the same token, some programs that use the majority language as the predominant instructional medium (e.g., because they serve a linguistically heterogeneous student population) may adopt bilingual instructional strategies that strongly reinforce students’ sense of pride in their own identities. Within these programs, students may be encouraged to use their L1 for group discussions or projects, to write in their L1 as well as the dominant language, and generally to showcase their multilingual talents (see Cummins, 2001, 2007 for examples). Empowerment, understood as the collaborative creation of power, can also be generated through instruction that evokes creative and critical thinking in ways that showcase students’ intellectual, artistic, literary, or linguistic talents. Such showcasing of students’ talents directly challenges the devaluation of the cultural capital of marginalized communities in the wider society.

In summary, theoretical frameworks organized around the construct of “empowerment” would predict that effective programs, regardless of whether they are labeled bilingual or monolingual, will enable bilingual students to carry out powerful intellectual work using both of their languages as cognitive and creative tools.

Endangered Languages

CONOR MCDONOUGH QUINN

Languages that are threatened with the loss of natural generational transmission are referred to as endangered languages. Language endangerment generally occurs in the later stages of language shift, that is, when a speech community moves away from their earlier variety, dialect, or language to a new one or new set thereof (Fishman, 1991). While the processes of endangerment and extinction have likely been constant throughout the history of human language, the scale and the pace of this loss—whose cumulative effect is the reduction of linguistic diversity—in the modern era appears to be uniquely intense, with up to half or more of the currently estimated 5,000–6,000 languages spoken today expected to be lost within a century or so (Hale et al., 1992). Both the nature of this loss and its consequences are complex and involve deep psychosocial factors as much as purely linguistic ones. Two common reactions to language endangerment include language revitalization and linguistic documentation, both of which present extensive challenges and opportunities for applied linguistics.

The sources of language endangerment are not uniform, but do generally present recurrent themes on both the broader external social/political/economic and the narrower community-internal and individual scales, corresponding in broad strokes to what Grenoble and Whaley (1998) refer to as macro- and micro-factors. From the macro-factor perspective, language shift can occur from sheer population loss of a speech community, due to war, disease, famine, or rather commonly, economically motivated outmigration, that is, dispersal into a diaspora that makes daily use of a given language no longer practical or meaningful/effective. Demographically stable communities, however, experience language endangerment just as readily when they are induced to shift for other reasons. Loss of prestige is a very common factor: It can be introduced through schooling, often reinforced by physical or social/emotional punishment of young speakers, or simply as a social contempt expressed in adult society by speakers of the dominant to the minority. As dominant languages are typically those spoken by the socioeconomically dominant, language shift is very often rationalized—both on the part of the speech community itself, or by outsiders—via ideological narratives of economic practicality, or homogeneous national identity. Hence, while there are exceptions, language endangerment is most typically experienced by minority and socioeconomically marginalized populations.

In addition to psychological internalization of the above factors, the internal or micro-factor side of language loss has as a primary component the local disruption of the social spaces in which the language has normally been used, and the shrinking of the range of such spaces. As most endangered languages have a primarily oral tradition (or no written tradition at all), full acquisition and rich fluency depends entirely on personal experience with other speakers. Reduction of the range of domains in which an individual can be exposed to the language commonly results in a feedback effect: otherwise fluent speakers who have knowledge or performance gaps are judged as imperfect speakers by more broadly experienced speakers (typically though not exclusively elders), leading the former to avoid situations of language use even more, and so intensify the process of contraction.

While a large population of speakers generally supports a language's maintenance, the importance of sheer numbers is secondary to the degree of transmission. A language can have no more than a few hundred speakers and still be less threatened than one with

thousands, so long as it is still being learned and regularly used by children. As the factors affecting transmission are very fluid, languages can shift from stable to endangered extremely quickly, often within the space of one generation. For the same reason, endangerment is often not salient even as it happens, as since three coexisting generations of grandparent, parent, and child can represent complete fluency, intermediate competence, and complete non-speaker status. One still-living full generation of fluent speakers can and often does give the illusion that the language is not seriously threatened; even more so if the majority of the community are ambivalent or antipathetic with regard to maintaining the language.

Language loss is not uniform, either. During the process of language shift, competence in the language can range from various degrees of fluency, to “remembered” speaker (full fluency from childhood but fallen into disuse), to rusty speaker (substantial but limited competence due to an early shift from the threatened language to another), to semi-speaker (characterized by imperfect acquisition of the complete earlier form of the language, due to limited exposure) (Sasse, 1992). From this can also emerge “young people’s languages”: complete but markedly distinct variants of the source language used by younger generations that have been substantially altered by these sorts of incomplete transmission processes (Schmidt, 1985). Even after a speech community is reduced beyond even one notional native speaker, a language or features thereof can persist: in more or less full lexicogrammatical form as a liturgical or literary language, or both (as in the case of Hebrew, Latin, and Classical Greek, among others), or as a set of rote-memorized ceremonial phraseology, or as features influencing the variety of the replacing language(s) now spoken by descendants of the former speech community. The lexical, phonological, and syntactic influence of Irish Gaelic on varieties of English now spoken monolingually in Ireland is a frequently cited example. Semantic and pragmatic features of the earlier language too may cross over. Mixed languages may also persist after a community has shifted away from an original contributory language. Michif and Media Lengua—results of contact between French and Cree, and Spanish and Quechua, respectively—for example, have replaced the indigenous source language in some communities; such mixed languages can and do also exist alongside populations continuing to speak their source languages.

Complete language loss itself can be problematicized. The notion of dormant or “sleeping” language has been developed for languages that have experienced complete disruption of natural generation-to-generation transmission, but that persist in substantial enough recorded form to permit the possibility of revival as a useable linguistic instrument (Leonard, 2007). Wampanoag and Miami represent two (Algonquian) languages currently being actively revived by descendants of the original speech communities, to the extent that children are being raised with the revived language as one of their first languages. Israeli Hebrew is perhaps the most famous case of a sleeping language subsequently revived as a full-fledged daily use language. Zuckerman (2009) and Leonard (2007) offer thorough discussions of the relationship between such revived languages and their source(s), particularly the first languages of their revivers. Finally, the application of the terms *endangered* and *extinct* have both been called into question as inherently stigmatizing and, particularly when the latter is applied to dormant languages, inaccurate, and disenfranchising (Rinehart, 2006).

The current intensity of language loss can be attributed both to essentially technological factors such as increased mobility (physical, social, and economic), telecommunications, popular media, education, and also to ideological and political factors such as the spread of the notionally homogeneous nation-state and cultural imperialism of various kinds. Language endangerment is thus strongly connected to other types of sociocultural dislocation.

With the loss of a given language also ripple out a host of ancillary losses. While loss of traditional language need not entail complete loss of traditional culture, language loss

is more often than not accompanied by loss of bodies of knowledge traditionally passed on via the language, ranging from the ceremonial/religious, historical, literary/rhetorical, technological, medical, and so on (Harrison, 2007; Evans, 2010); it is often observed that the loss of a language results in the loss of a whole unique worldview implicitly and explicitly encoded in language-specific form and usage. For discussion of how language loss affects and reflects the broader questions of biocultural/intellectual diversity, see Fishman (1982), Maffi (2001), and Dalby (2003), as well as Harrison (2007) and Evans (2010).

Often generational transmission of social norms and values is affected when languages are lost; as is coherent community identity. A traditional language frequently functions as a pervasive and potent marker of membership therein: both emotional and intellectual connections to previous/ancestral generations can be rendered much more tenuous with its loss. Sheer grief (and at times even shame) at the loss of a cherished part of personal, familial, and community heritage is a situation-specific but very common experience, salient and wrenching to its affectees, even as it can be missed or underplayed by strictly materialistic/utilitarian approaches to the role of language in human life.

For linguistics and related cognitive sciences, what is lost is the opportunity to investigate the full diversity of human linguistic potential. This is particularly crucial in the testing of universal claims about possible versus impossible human linguistic systems. Currently endangered and recently extinct languages have all offered unique contributions to the understanding of human language and by extension, human cognition. Damin, an auxiliary language traditionally used among the Lardil of Wellesley Island, North Queensland, Australia, for example, uses several phonetic mechanisms not found in any other known languages (and the only known click systems outside of southern Africa). It also exhibits an unparalleled intellectual creation: a carefully semantically abstracted lexicon of approximately 200 elements that can express the full range of the everyday Lardil language's much richer system (Hale, 1998). Many other features of human language which are evidently quite common as possible grammatical options remain under-researched and poorly understood because they are, by historical accident, chiefly only found in languages that are currently endangered/threatened: among others, these include polysynthesis, switch reference, and complex evidential contrasts.

At present there are two frequent active responses to language endangerment (i.e., beyond simple acceptance): language revitalization and language documentation. Both pose interesting challenges for applied linguistics. At the time of this writing, there is an emergent consensus (though see Newman, 1998, for an alternative view) that it is incumbent upon linguists (and policymakers) to support language revitalization, namely, active efforts to recover and restore an endangered language to active daily use in a speech community (Hinton & Hale, 2001; for introductory handbooks, see Hinton, 2002, and Grenoble & Whaley, 2006).

Simultaneously, an effort has emerged to document as many features of endangered languages as possible before their potential or even likely disappearance. Currently several institutions have been established that specifically support language documentation (see Online Resources). While language documentation of course can contribute substantially to language revitalization, the priorities of each do not necessarily overlap completely. Since unambiguous examples of thoroughly successful language revitalization efforts are still quite rare, focusing on documentation rather than revitalization can, particularly in academic circles, be seen as a more realistic use of limited resources to address language loss (see Bowerman & James, 2010, for a challenge to this view).

That said, documentation and revitalization efforts more often than not go hand in hand, particularly because endangered language speech communities typically expect documentation (still most often done by outsiders) to contribute substantially to revitalization efforts. One recurrent difficulty in this domain is that the basic training for performing linguistic

research, even documentary field work, is at best only dimly overlapping with the psychosocial and pedagogical training necessary for effective revitalization work. In recent years there has been an increasing focus on transferring the crucial skill sets of both documentation and revitalization from outsiders (primarily academics) to community members (primarily educators and language activists), suggesting that the bulk of endangered language work will continue to embrace both kinds of response.

Endangered Languages in Australia

NICK THIEBERGER

Australia has the dubious reputation of being home to many of the world's most endangered languages, and having been the home of many indigenous languages that are no longer spoken. This entry will not touch on the many endangered immigrant languages that are spoken on this continent, neither will we address Australian Sign Language, also an endangered language of Australia. Australian languages should be understood to encompass all indigenous languages of Australia, and include Torres Strait Islander languages, Meryam (a Papuan language of Torres Strait), and Tasmanian.

Before non-Aboriginal people arrived there were between 250 (Dixon, 2002, p. 2) and some 600 languages spoken in this continent. These different figures can, to some extent, be attributed to the shamefully little that has been recorded of Australia's indigenous languages. For a listing and details on each language see Austlang (Australian Institute of Aboriginal and Torres Strait Islander Studies, 2010).

Australian languages are considered to form a number of language groups or families, with one, called Pama-Nyungan by linguists, covering most of the country from Cape York to Western Australia, and the other 26 or so all clustered in the Top End and Kimberley region (Tasmanian languages have not been shown to be related to other Australian languages, but that is likely to be due to the long period of their separate development after sea levels rose in the Holocene). Pama-Nyungan languages typically use suffixes for tense and for case marking, while the northern languages typically use prefixes, among other diagnostic features (see Bownern and Koch, 2004). Archaeology tells us that people have lived in Australia for at least 60,000 years, but it is clear that the families of languages we know today have not been here for that long, with similarities across wide areas suggesting a relatively shallow time depth, maybe in the order of several thousand years.

While there were promising signs at settlement that Europeans may have learned local languages and been assisted by Aboriginal people to understand the country and how to live in it, that soon changed over much of the country to a more punitive model. Conflicts over land and resources resulted in guerrilla actions by indigenous people and massacres perpetrated by colonists, following the colonial frontier across the country. Aboriginal people from different language groups were concentrated in missions and reserves, and boarding schools took children away from their families. This concentration of speakers of different languages in missions and reserves promoted the use of English and also led to the development of *lingua francas*—pidgins and eventually creole languages that continue to perform important communicative functions for indigenous people. In part, it could also be the diversity of Australian languages that contributed to their eventual endangerment, as no one language dominated or was the focus of teaching and learning in the wider community (although Yolngu Matha and Pitjantjatjara could be seen as regional exceptions, being two popular Australian languages learned by non-Aboriginal people). Another contributing factor is the multilingualism that allowed Aboriginal people to add English to their repertoire, in contrast to the prevailing monolingualism of the dominant Australian society whose policies suggest it continues to think of bilingualism as subtractive rather than additive.

McConvell and Thieberger (2001) note that there has been a decrease of 90% in the number of indigenous languages spoken fluently and regularly by all age groups in Australia since 1800 and a decrease in the proportion of the Aboriginal population who speak an indigenous language to 13% in 1996. More recently the National Indigenous Languages Survey (Australian Institute of Aboriginal and Torres Strait Islander Studies & Federation of Aboriginal and Torres Strait Islander Languages, AIATSIS & FATSIL, 2005) found that, of the 145 indigenous languages still spoken in Australia, 110 are critically endangered and only 20 could be considered strong.

Efforts to support the ongoing use of language have included community-based activities such as language courses for adults, preschool vernacular programs, and bilingual education programs (e.g., the Strelley schools and others in Western Australia). Governments have, at various times, provided support for these activities, but often without guarantees of longevity, so that programs have to support periods without funding, or even close down altogether. Government bilingual programs began in some South Australian schools in the late 1960s and bilingual programs were introduced in some Northern Territory and Western Australian schools from 1973 (Hoogenraad, 2001). Since then the programs have had patchy support from government.

Language curricula were developed in Western Australia (Hudson, 1994) and in South Australia (Senior Secondary Assessment Board of South Australia, SSABSA, 1996), and Purdie, Frigo, Ozolins, Noblett, Thieberger, and Sharp (2008) summarize a number of other educational programs involving Australian languages. These programs, in general, rely on speakers of the languages as teachers or curriculum developers. Furthermore, a number of collaborative linguistic projects have resulted from the dedicated efforts of both speakers and academic linguists, including text collections, dictionaries, and multimedia records of languages (see Nathan, 2010, for links). While few Aboriginal people have pursued academic study of their languages, notable exceptions are the late Dr. Raymattja Marika, Dr. Eve Fesl, and Jeanie Bell, who teaches at the Batchelor Institute for Indigenous Tertiary Education.

Academic research on Australian languages has been characterized as occurring in three main phases (McGregor, 2008), with the most recent starting in the 1960s. It is in this period that we have seen detailed grammatical descriptions of indigenous languages, with a few extensive dictionaries (for example, Henderson & Dobson, 1994).

There is increasing interest in the use of Australian languages and in relearning or supporting their continued use. The Aboriginal Languages Association was a lobby group formed by linguists and indigenous people in the 1980s and it organized conferences and helped to convince governments to fund language programs.

The Australian government has made some commitment to support for indigenous languages, with funding of a network of indigenous language centers. These centers initially started in the Kimberley (Hudson & McConvell, 1984) in the mid-1980s, then the Pilbara (Sharp & Thieberger, 2001) in 1987, and now are established all around the country. The current funding source is the Maintenance of Indigenous Languages and Records and in 2009–10 it funded 64 projects for AU\$8.8 million.

There are also radio and television broadcasts in Australian languages. In the late 1980s there were 80 transmitters broadcasting local television and radio under Aboriginal control, often including local languages. More recently, as many as 96 remote indigenous broadcasting services (RIBS) provide local content, often including local languages. A very few feature films have been produced incorporating Aboriginal language dialogue, for example *Ten Canoes* (de Heer and Djigirr, 2006) and *Rabbit Proof Fence* (Noyce, 2002).

Some languages that were no longer spoken and were known for many years only from brief written records are now being “awoken” in revitalization programs. These programs occur from time to time in various places; examples include Gamilaraay (NSW) and

Nyungar (WA). Currently Kurna (Adelaide, SA) is the best known example, and the community of relearners of Kurna have been active in developing terms and delivering texts for public use of the language (Amery & Gale, 2008).

Endangered Languages in Canada

DONNA PATRICK

Canada is home to a great variety of indigenous languages, which comprise 11 language families. However, all of these languages are considered to be endangered. Among these language families, four—Algonquian, Athapaskan, Inuit, and Siouan—have languages that, while endangered, are still seen as “viable,” predicted to remain in continued use (Norris, 2007, p. 23). Other languages, belonging to the Iroquoian and Tsimshian families, are being acquired as second languages (L2) and are the subject of ongoing language revitalization efforts, but have a small number of first language (L1) speakers and face an uncertain future. The languages that comprise the other five language families—Haida, Kutenai, Salishan, Tlingit, and Wakashan—are even more vulnerable.

According to the 2009 *UNESCO Atlas of the World's Languages in Danger* (UNESCO, 1995–2010), the most current source for information about language endangerment, there are 88 endangered languages in Canada. Despite the authority of this source, a definitive figure for endangered languages remains elusive. This is because it is difficult to determine what counts as a distinct language, what counts as an “endangered language,” and what factors and social processes give rise to language “endangerment.” In addition, many endangered languages in Canada are very much “alive,” benefiting from ongoing language revitalization and renewal efforts and being used in diverse social contexts.

Languages and Language Varieties Identified as “Endangered”

Identifying the number of endangered languages in Canada depends, in the first place, on determining how many indigenous groups there are in Canada and how these groups and their language varieties are classified. For example, there are 50 or more endangered languages in Canada according to a classification based on the Canadian census (Norris, 2007). This figure differs significantly from the UNESCO *Atlas* figure of 88 given above. Yet this difference is attributable entirely to the way in which languages are counted in the two schemes. For example, while the census-based scheme identifies one Cree language, the UNESCO *Atlas* identifies seven distinct Cree languages. Further complicating such classification is that speakers themselves might take their local language variety to be a distinct language. As in other indigenous language contexts, the politics of distinguishing languages from language varieties (or dialects) in Canada plays a role in determining the number of endangered languages.

Classifying “Endangerment”

The notion of “endangerment” also gives rise to problems of classification, including what counts as an “endangered language” and what factors determine different degrees of “endangerment.” This is because an array of dynamic social processes may enter into the determination of the degree of a language’s vitality and viability, including social, political, and cultural processes affecting language learning and teaching in a given context as well as the social meanings and practices associated with indigenous language use.

DOI: 10.1002/9781405198431.wbeal0371

This problem of classification can be seen in both similarities and differences between classification schemes. According to the *Atlas* scheme, languages whose continued use is uncertain may be “vulnerable,” “definitely endangered,” “severely endangered,” “critically endangered,” or already “extinct.” These categories reflect the measurement of a language’s “vitality,” involving such factors as the number of its speakers, materials development, media use, documentation quality, policies, attitudes, and intergenerational transmission. According to another scheme, that of Kinkade (1991) and Norris (2007), languages may be “viable with a large population,” “viable but with a small population base,” “endangered,” “near extinction,” or “already extinct.” These categories reflect rather different factors, including the relative size of the population base and the number of younger speakers. Accordingly, the latter scheme classifies three languages, Cree, Ojibwe, and Inuktitut, as large, viable languages, and Montagnais, Micmac, Oji-Cree, Attikamek, Dene, Dogrib, Chilcotin, and Dakota also as “viable,” though with fewer than 1,000 speakers each. In contrast, the *Atlas* scheme classifies 24 of 88 endangered languages as “vulnerable,” the most viable category of endangered language (with the rest classified as even more endangered), including all of the “viable” languages mentioned in Norris (Cree, Ojibwe, Inuktitut, and Montagnais being broken down into additional languages).

Despite the categorization difference between the schemes, both still classify a language’s viability on the basis of quantitative factors alone. Yet what emerges from the census-based research documented in Norris (2007) is that alongside a declining number of L1 speakers of indigenous languages in Canada (which now amounts to under 25% of the total indigenous population) is an increasing number of L2 speakers of these languages among the indigenous population (Norris, 2007, pp. 19–20).

Granting the challenges faced by efforts to define and classify endangered languages, what is clear from available survey data is that indigenous L2 learning and language use is a growing trend (Norris, 2007), and one that is not always adequately reflected in current measures of indigenous language vitality and viability. In light of this, more qualitative research is needed to determine how and why this L2 learning is occurring, what constraints and challenges exist for language revitalization, and what meanings and attitudes are associated with current indigenous language use.

Language Revitalization

Despite the rather negative impression of language viability created by language endangerment discourse (Duchêne & Heller, 2007), many endangered languages in Canada are, in fact, very much “alive” and used in a variety of contexts. While the use of Inuktitut and the attitudes associated with this use have received some scholarly attention (Norris 2007, p. 26; Dorais & Sammons, 2002), many other language revitalization contexts merit similar attention. This might include research that investigates the perspectives of language learners and educators as well as ongoing language revitalization and renewal projects.

In sum, every indigenous language in Canada is considered to be “endangered” to some degree, a fact highlighted by language survey and mapping research. However, there are serious limits to this quantitative and typological research. Many indigenous people, particularly children, are learning their ancestral languages, and many more express a desire to do so (Norris, 2007, p. 24). What might be needed, then, is research whose methodology is sociolinguistic, ethnographic, and collaborative and which seeks to provide more nuanced accounts of language in interaction, both within and across generations, and of the language attitudes and sociocultural values that accompany this use.

English Across South Asia

TARIQ RAHMAN

The British East India Company, founded in 1599, introduced English in India in the elitist domains of power—government, administration, judiciary, military, education, commerce, and the media—between the 18th and the 19th centuries. British language policy, aimed at governing the empire (Cohn, 1985), passed from an Orientalist to an Anglicist phase following T. B. Macaulay's famous "Minute" of 1835 when English came to be used for elitist and higher education. Thus English became part of "cultural politics" (Pennycook, 1994) and was taught through its classics, which created an idealistic and morally inspiring image of the British and gave moral justification to British rule in India (Viswanathan, 1989). By the time British rule came to ended in 1947 English was a coveted "linguistic capital" in Bourdieu's (1991, p. 70) sense of the term. As such, it was an elite social class marker facilitating upward social mobility in urban, professional circles in South Asia.

English continues to enjoy this dominant status in South Asia despite resistance to it in the precolonial India (Gandhi, 1942, p. 62, 1980, p. 46), postcolonial Pakistan (Abdullah, 1976), Sri Lanka (Raheem & Ratwatta, 2004, pp. 94–6), and Bangladesh (Hossain & Tollefson, 2007, p. 248). These resistance movements were counteracted by the expansion of English through improved means of communication, especially in the electronic media and cyberspace (Crystal, 2004, pp. 64–91), and the aspiration of the expanding middle class for upward mobility both nationally and internationally.

The general pattern of the use of English throughout South Asia is that it remains the language of the elitist sectors of the state, the corporate sector, foreign-funded think tanks and nongovernmental organizations (NGOs), higher education, science and technology, and elitist educational institutions. Variations in the pattern are visible in Sri Lanka and Bangladesh. In Sri Lanka, the use of English was reduced in the state sectors when Sinhala became the official language in 1956. However, this made the Tamils resent the domination of the Singhalese and created ethnic conflict which ended after much bloodshed in 2009 (Kandiah, 1984; De Silva, 1996). However, English survived among the Westernized elite and, since 1995 when it was recognized as a national language, it has emerged as a language of privileged employment (Raheem & Ratwatta, 2004, pp. 98–103). In Bangladesh, the state patronized Bengali after 1971 when the country got its freedom after a war with Pakistan. However, the forces of globalization and the interests of the Westernized elite gradually brought English back through private education and non-state employment (Hossain & Tollefson, 2007, pp. 253–6). In Nepal, as the country opened out to the forces of globalization, the role of English increased in society (Sonntag, 2007, pp. 212–13). In Bhutan and Maldives English is used in the schools and its presence increases with increasing tourism.

In India and Pakistan English was never seriously questioned (Rahman, 1996, pp. 230–48; Agnihotri & Khanna, 1997, pp. 143–4) despite constitutional promises to remove it as an official language. In both countries it is seen as a vehicle of modernization and development and the language of cutting-edge research, the Internet, globalization, and international mobility, which is why there has never been an effort to remove it from the educational system though its supply is highly uneven and unjust.

South Asian governments teach most children, when they do teach them at all, through the vernacular languages, while reserving English for the elite of power and wealth.

Higher education, especially in the science and technological subjects, is in English, while institutions in the periphery, as well as arts and humanities subjects which are considered of secondary importance, are taught in the vernaculars. This vernacular–English divide (Ramanathan, 2005) is contingent upon the distribution of power in South Asia rather than a free choice of the medium of education.

Elitist functionaries of the modernized sections of society, therefore, have near-native command over English, while the products of vernacular-medium education aspire to imitate them with varying degrees of success. In this sense, then, English is an imperialist language (Phillipson, 1992; Skutnabb-Kangas, 2000, pp. 372–4) which serves as a device for privileging the cultural hegemony of the West and maintains the cultural and intellectual domination of the English-using elite within South Asian countries. However, at least in the case of Pakistan, it is noteworthy that the English-using elite are politically more liberal, democratic, and tolerant than the vernacular-educated and religious-seminary educated people (Rahman, 2002, pp. 592–6). Thus, any attempt at changing the status of English ought to be situated in the complex set of economic, political, religious, and cultural variables which may affect the outcomes of such changes (Rahman, 2007).

South Asian countries shifted from teaching English through its literature and grammar-translation to ELT—English language teaching or the teaching of English as a second or foreign language—from the 1970s onwards. India led the change (Agnihotri & Khanna, 1995), but Pakistan (Rahman, 2002, pp. 315–20), Sri Lanka (Perera, 2008), and Bangladesh followed (Salim & Mahboob, 2001, pp. 141–51; Rahman, 2008). Like the teaching of literature, this too has a sociopolitical dimension, relating as it does to better acquisition of English among urban, elitist students than rural, nonelitist ones (Hall & Eggington, 2000).

One result of this emphasis on language was to bring about the recognition among teachers of English that non-native varieties of English—Indian English (Kachru, 1983), Pakistani English (Baumgardner, 1987; Rahman, 1990), Sri Lankan English (Passe, 1947), and so forth—should be recognized not merely as “incorrect” English but as alternatives. But these non-native varieties of English vary according to the first language and the degree of the exposure of the speaker to English.

While de-emphasizing the canonical works of English literature, the new emphasis on the language itself did not adversely affect the production of creative literature in English in South Asia. India produces most of this literature (Verma, 2000), but Pakistan has progressed from being a minor producer until 1991 (Rahman, 1991) to being a rising star in the field (Shamsie, 1997). Other countries too produce literature in English (Alam, 2006, pp. xv–xxiii). The major themes of this literature are the postcolonial tensions between tradition and modernity and search for an authentic identity.

In short, English is a dynamic presence in South Asia. On the one hand it is an elite marker which consolidates the Westernized elite’s hold over wealth and power in the region but, on the other, it enables South Asians from the lower middle and middle classes to aspire for personal empowerment both nationally and abroad. That is why it is very much in demand and institutions promising to supply it to millions of aspirants are proliferating in thousands, mostly in the private sector. It is also a language of spontaneous personal use among the elite and its writers are winning recognition internationally. Despite its divisive potential—as a device for restricting access to the elite—it is regarded in a positive light as a promoter of upward social mobility. Thus, after the departure of the British, English has gained a stronger foothold in South Asia than ever before.

English and Multilingualism in Singapore

LISA LIM

To appreciate the situation of English in Singapore, one must recognize the multilingual context in which English has existed from the outset. Claimed by the British East India Company in 1819 as a nonsettler exploitation colony, Singapore saw both the introduction of English and the development of a multicultural, multilingual population that characterizes the nation today.

Its establishment as a trading post brought about a dramatic population increase from a few hundred to half a million within a century, a result of the rapid influx of immigrants from all over Asia, resulting in a mix of peoples and languages of heterogeneous origins (see Lim, 2010a, for a comprehensive account). The “Malays” included immigrants from various parts of the Malay/Indonesian archipelago who spoke not just Malay but also Javanese, Buginese, Boyanese; the “Chinese,” largely from the southern coastal areas of China, spoke Hokkien, Teochew, Cantonese, Hakka, Hainanese; the “Indians” from the north and south of India as well as Ceylon had Tamil, Telugu, Malayalam, Punjabi, Bengali, Sinhalese as their languages. There were also mixed communities such as the Straits Chinese whose vernacular was Baba Malay, and Eurasians who spoke Portuguese Creole. During this era, Bazaar Malay, a form of restructured Malay, the lingua franca in the region for centuries, served as the interethnic lingua franca in Singapore, with Hokkien the intra-ethnic lingua franca for the Chinese. The formal introduction of English language was via English-medium schools, the first in 1823, which, while initially for the elite, rapidly increased in enrolment: by the late 1940s about a third of students were enrolled in English-medium schools. The English acquired was at the outset a second language for the local population.

At independence in 1965, Singapore’s language policy embodied pragmatic multilingualism. English, the former colonial language, was retained as an official language, serving as the language of science and technology and of international trade and commerce, and as a neutral non-native language not associated with any of the Asian cultures and not the mother tongue of any of the ethnic groups, giving none an advantage. The three other official languages, Mandarin, Malay, and Tamil, referred to in official discourse as “mother tongues” (MTs), representing the three official races “Chinese,” “Malay,” and “Indian” respectively, were selected to act as cultural ballast and provide Asian values (see Wee, 2003; Wee & Bokhorst-Heng, 2005). English became the primary working language, and was made a compulsory language in schools, initially either as a first language, or as a second language in the vernacular (Chinese-, Malay-, or Tamil-medium) schools, and eventually, by 1987, as the medium of instruction in all schools, with the “mother tongue” learned as a “second language” in an English-knowing bilingualism system.

Up until the 1970s, Singapore society continued to be highly multilingual (Kuo, 1980, p. 51), with a typical repertoire of a Singaporean Chinese including the native Chinese dialect, the dominant Chinese dialect, Hokkien, one or more additional Chinese dialects, Bazaar Malay, and possibly English, Mandarin, Baba Malay and Malay (Platt, 1980, pp. 64–5). However, the active implementation of the postindependence language policies (Bokhorst-Heng, 1998), involving the aggressive promotion of certain languages over others—for

example, the annual Speak Mandarin Campaign, started in 1979—had a significant impact on the multilingual situation and on English. Mandarin became the language most frequently spoken at home for the Chinese as a whole, increasing from 10 percent (1980) to 45.1 percent (2000), displacing other Chinese languages; 87 percent of the Chinese claimed to be able to understand Mandarin by 1988, and it became the language of choice for many younger Chinese Singaporeans' intra-ethnic communication in all domains. English started displacing Hokkien and Bazaar Malay as lingua franca from the late 1970s to early 1980s, especially amongst the younger and more educated, with some 70 percent of Primary 1 children in 1990 having English as a dominant language (Lim & Foley, 2004, pp. 5–6).

With new generations having a proficiency in English and using it as one of their dominant languages, in a context of contact with many other local languages, a restructured variety of English has evolved, Singapore English (SgE), which may be viewed as existing in a continuum from acrolect through mesolect to basilect, or as a more standard versus colloquial SgE. Quite swiftly, within some two decades, SgE underwent nativization, attaining endonormative stabilization, and Singaporeans can be said to be native speakers of SgE (Gupta, 1994; Lim & Foley, 2004). The linguistic features of SgE have been widely documented (e.g., Lim, 2004) with some particularly characteristic features being: the typological trio of zero copula, predicative adjectives and topic prominence (Ansaldi, 2009) aspects (Bao, 2005); discourse particles acquired from the local languages Malay, Hokkien, and Cantonese (Gupta, 1992; Lim, 2007); and Sinitic-type tone on particles and at word and phrase level (Lim, 2009a, 2010a, 2010b). What is noteworthy is how these reflect the multilingual nature of the contact dynamics, and also how more contemporary SgE seems to show more Chinese influence.

The increasingly widespread use of Singlish, the more colloquial/meso-/basilectal variety, led to the government's concern that it would adversely affect Singaporean's competence in Standard English and consequently their global intelligibility and economic competitiveness. The Speak Good English Movement (SGEM), launched in 2000, pits Singlish against "good English," discouraging its use in all domains, even intimate, informal ones where colloquial varieties of any language would be natural and expected (see Rubdy, 2001; Lim, 2009a).

In spite of the official stand on SgE, the variety has been widely embraced by its speakers, as evidenced in myriad online material (e.g., www.TalkingCock.com and www.mrbrown.com), as well as Singlish dictionaries. The variety has also been documented as being used in a fluid mix with more Standard English in teacher talk within a classroom setting for negotiating identities and achieving goals (Alsagoff, 2010). Such "glocalization" in the mixing of codes is not restricted to varieties of English. Given the multilingual setting that is Singapore, it is hardly surprising that code switching/mixing abounds: tight mixes of English, Mandarin and Hokkien, or English and Malay, and so forth, have been documented, noted for example, in the Grammar of Spoken Singapore English Corpus. What is particularly interesting is that such a plurilingual practice may be considered a mixing that is a single code in its own right (Lim, 2009b), one which characterizes the SgE speaker in today's multilingual ecology.

English and the Vernaculars From a Postcolonial Perspective

VAIDEHI RAMANATHAN

This entry offers a situated account of English and vernacular literacy practices from a postcolonial perspective. Postcolonial scholarship in disciplines such as cultural studies and English literature has alerted us to the extent to which colonial rule partially created and reproduced negative images regarding “natives” so as to be better able to govern. Within applied linguistics, this awareness provides a necessary sociohistorical background against which to understand current grounded realities around language teaching and learning. Particular colonial policies in South Asian education—especially the divide between the English-medium (EM) and vernacular-medium (VM) assume neocolonial hues and dovetail directly with local societal stratifications (of caste and class) that exacerbate unequal conditions between those who are educated in the two tracks. Situated in an ongoing endeavor of a variety of local contexts in Ahmedabad, Gujarat, India, this entry calls attention to some key educational sites through which these inequities are reproduced, and some ways in which individual teachers and institutions assume the right to make conditions more just and equal. The entry concludes with a discussion of how a post-colonial research framework allows us not only to understand grounded inequities in terms of historical colonial pasts, but also how fellow humans draw on particular rationalizations to work toward moving us all to more a equal footing.

What Is Postcolonialism?

In simple terms, postcolonialism refers to points of view of people from formerly colonized countries regarding their colonial past. In terms of scholarship, it manifests itself as “speaking back” to colonial powers, often in the language of the colonizer. European colonial powers had in the 19th century assumed the right to take over entire countries—almost all of them non-Western—and sought to rationalize their takeover in terms of prevailing anthropological discourses that viewed non-Western peoples as “inferior, child-like or feminine, incapable of looking after themselves (despite having done so perfectly well for millennia) and requiring the paternal rule of the west for their own interests (today they are deemed to require ‘development’)” (Young, 2003, p. 2). Atrocities committed by colonial powers in the defense of building empires varied in different countries, with some cataclysmic events spurring local “subjects” toward fighting for independence. Within the Indian context, the Jallianwalla Bagh massacre of 1919 where General Dyer opened fire on an unarmed crowd of 20,000 people was a pivotal moment for freedom fighters such as Gandhi, Tagore, and Andrews (see Ramanathan, 2009) who sought to overturn more than 500 years of colonial rule (India Independence was won in 1947).

The policies and mandates that the English colonial powers set in place, especially in the field of education, were in many instances (including the South Asian context of India, Pakistan, Sri Lanka, and Bangladesh) ones of “divide and rule.” This was a mode of operating that the Raj (as the English colonial power is known in India) devised so as to rule more effectively. The Raj needed Indians to run their empire and so offered English

education to small numbers of Indians that would help them in this endeavor. This one colonial policy took root and went very deep into the South Asian ideological space to the point that EM education was deemed as having more cultural capital and symbolic power than an education in the vernacular (Gee, 1990; Kalantzis & Cope, 2002; McCarty, 2002, 2005), an ideology that is very visible, enacted, and real today. The general importance accorded to English and the extent to which it pervades the everyday life of the postcolonial person, has, from the point of view of some scholars, rendered the postcolonial identity “hybrid.” Indeed, authors such as Verma (2010) write about “forked tongues” and the general deracination a person educated in EM feels because they do not have as intimate a connection with their local vernacular as they do with English (and so by extension may be seen to feel “less Indian”). Postcolonial scholarship often refers to this amalgam as being “hybridized” because a variety of colonial and vernacular resources inform personal identities. (Formerly colonized countries have also been called the “subaltern” since they remained on the margins of dominant hegemonic power structures.)

Locating the Research in India in This Framework

Ramanathan’s long-term research endeavor with EM and VM teachers and students in Ahmedabad, Gujarat has to do with partially addressing ways in which colonial policies assume neocolonial laminations in current postcolonial India. Sixty-five years on from independence from the Raj, India has begun to rethink and change colonial education policies. But many colonial mandates remain and this entry addresses how everyday lived realities are negotiated. The pool of raw materials that forms the research on which the current discussion rests spans 1999–2011 and what is presented here is a most selective sample, and is not intended, by any means, to be comprehensive. This pool includes:

- close workings with three institutional contexts (an EM middle-class Jesuit college, a private EM middle-class business college, and an inner-city, poor VM women’s liberal arts college);
- twenty-one semi-formal interviews with faculty members across the three institutions, each of which lasted about an hour and a half long, more than 80 interviews with EM and VM students, more than 109 hours of classroom observations in the three settings;
- a variety of written documents ranging from official bulletins, student writing, assignments, newspaper articles, exams;
- a range of informal discussion meetings where teachers freely exchanged ideas about teaching practices, workloads, institutional and state-level educational policies; and
- extensive engagements and interviews at the Gandhi Ashram where civic efforts at community building happens through non-formal education.

Instances of the English–Vernacular Divide

Vernacular-Medium Pedagogic Practices

One instance of the gulf between students educated in the EM versus those in the VM can best be exemplified by the use of vernacular learning practices such as choral recitation, which are commonplace in VM classrooms. The excerpt from a Gujarati-medium (GM) textbook illustrates this (see Figure 1).

The instructions in Gujarati (on page 21 of Figure 1) direct students to (a) stand up and repeat after the teacher, (b) to engage in single and choral repetition with partners enacting the dialogues, and (on page 20 of Figure 1) (c) to draw on the formulaic phrases

Figure 1 Excerpt from a Gujarati-medium textbook, Standard 5 (Nataraj & Joshi, 1999, pp. 20-1) © Gujarat State Board of School Textbooks, Gandhinagar

(She is _____, She is _____) and to repeat them singly or chorally. These modes of learning are evident in classroom interactions as well with teachers frequently eliciting choral responses from students. The following interactions from Sanskrit and English classes illustrate this:

Sanskrit-class excerpts:

1. T: *Kaya text laavanu cche?* (Which text is to be bought?)

Sts: (responding chorally): *Kaadambari text laavanu cche.* (Kadambari [a Sanskrit play] is to be bought.)

T: *Kyan thhi laavanu cche?* (Where is it to be bought from?)

Sts: *Ratan pol maathi laavaanu cche* (from Ratan pol)

2. T: *Tho eh vakhate Avanti eh, kone?* (So at that time Avanti, who?)

Sts: Avanti

T: *Avanti eh kharraab laagyu. Su laagyu?* (Avanti felt bad. What did she feel?)

Sts: (responding chorally) *Kharraab laagyu* (felt bad)

English-class excerpts:

3. T: *Kayaa form karvaana chhe ame?* (What form are we doing this year?)

Sts: Comedy form (said in English)

T: *Ane kaaya playwright vaanchvaanu chhe?* (And which playwright are we reading?)

Sts: Wilde

The English and Sanskrit classes had 8–10 such interactions, as opposed to an average of 2 per class in the content-area classes. The questions on the part of the teacher in each of these excerpts are uttered in distinct ways: slowly in a sing-song manner with an exaggerated rise at the end (Ramanathan, 2005a, 2005b). The general explanations given by the language teachers for using such practices range from “classical languages like Sanskrit have always been sung or chanted” and “singing and chanting allows you to memorize information” (taken from a faculty interview, hereafter [FI]) to “this is what they have been used to in school and other non-schooling areas” (FI). As shown elsewhere (Ramanathan, 2005a), such choral recitations are not unusual in the community, especially in discourse events such as “*kathas*” in temples where priests take certain Hindu myths and explain their relevance to everyday living (*Ameh katha maa kevi rithe kahiye cche?* How do we speak in kathas?), and at key junctures elicit choral responses. Breaking-off to ask questions in the middle of extended narrative turns to get an audience to respond together serves the dual purpose of ensuring audience participation as well as testing attention. One of the instructors who also gives these *kathas* in local temples (indeed, many of the students had attended them) maintained that chorusing responses—a vestige of a strong oral, vernacular tradition (Crook, 1996)—allows novices to engage in learning without apprehension of being judged. Several of the interviewed students said they often picked up “answers” from their friends in such responses and that they could recognize the intonational cues of their teachers’ voices that prompted such responses because they were used to it in other relatively less non-academic, and non-institutionalized settings.

Divergent Pedagogic Goals in English-Medium and Vernacular-Medium Classrooms

Another very local instance of the English–vernacular divide is in the divergent pedagogic goals for English literacy for students in the two tracks of education. Called “minimal levels of writing,” or MLLs, these writing requirements are mandated by the Gujarat State Board of Education, and are partially presented in Table 1.

Two noticeable writing-related differences above are: (a) writing for VM students is presented as a discrete skill and is addressed separately from reading, a feature that contrasts with writing and reading being presented as conjoined entities for EM students; and (b) that writing for EM students is essayist in orientation from early on: “writing paragraphs on given topics” versus “gaining the basic mechanics of English writing . . . with proper spacing” (EM and VM textbooks respectively, grade 5), or learning to write words and sentences neatly versus writing essays based on the texts (VM versus EM texts, respectively, grade 7).

Such instances of the “divide” necessarily force one to raise the following two questions: What can be done to make language-education issues more equitable? And how do researchers, policy makers, teachers, and institutions work at bridging such sociopolitical gulfs? The following section addresses examples of how particular instructors and institutions have found “back-door” ways of circumventing English- and vernacular-related divides.

Bridging the Divide by Harnessing Vernacular Resources

As explained elsewhere (Ramanathan, 2005a), recognizing that teaching their largely low-income students English is not going to empower them (“Teaching them English is not going to do it; that has to come later,” [FI]), the VM teachers at the women’s college have found non-conventional approaches to refashioning their educational realities by enhancing both the vernaculars and the self-esteem of their VM students. Interpreting “empowerment” and “pro-vernacular” in terms of addressing local, community problems,

Table 1 Divergent MLLs for GM and EM students (from Purani, Salat, Soni, & Joshi, 1998, pp. 1–3)

	<i>Excerpts from MLLs from English textbooks used in the Gujarati-medium</i>	<i>Excerpts from MLLs from English textbooks used in the English-medium</i>
Grade 5	<i>Writing:</i> Gains control of the basic mechanics of writing in English like capital letters, small letters, punctuation, writing neatly on a line with proper spacing Transcribes words, phrases, and sentences in English Writes cardinals up to fifty, telephone numbers, road signs Produces words and spells them correctly Writes numbers up to 50, telephone numbers, road signs	<i>Reading and writing:</i> Reading textual material and writing answers to questions based on and related to the text Reading and interpreting and offering comments on maps and charts Reading children's literature and talking about it Writing paragraphs on given topics Reading and writing simple recipes Reading and interpreting labels on wrappers
Grade 6	<i>Reading:</i> Reads aloud simple sentences, poems, dialogues, and short passages with proper pauses Reads and follows given directions Reads numbers up to a hundred <i>Writing:</i> Writes with proper punctuation marks Writes words and sentences neatly on a line with proper spacing, punctuation marks, and capitalization Writes answers to questions based on text material Writes simple guided compositions in 4–5 sentences on people, objects, or places Translates words and sentences from English into Gujarati and Gujarati into English	<i>Reading and writing:</i> Reading textual material and writing answers to questions based on the text Reading and interpreting simple abbreviations Reading narrative prose and adventure stories and talking about them Writing/building stories based on given questions/points Reading and using the telephone directory Writing captions for given photographs, pictures, maps, charts, diagrams and graphs Writing messages for telegrams Reading and interpreting labels on bottles
Grade 7	<i>Reading:</i> Reads aloud simple sentences Finds key words and phrases from a text <i>Writing:</i> Writes words and sentences and paragraphs dictated with correct spellings, proper punctuation marks Learns to write words and sentences neatly on a line with proper spacing and punctuation Writes answers to questions based on the text Writes simple guided compositions Writes informal chits [notes]—thank-you notes and invitations	<i>Reading and writing:</i> Reading textual material and writing answers based on the text Writing essays based on the text Reading literary stories and prose lessons Reading simple passages of reflective prose Reading and interpreting common instructions such as railway timetables Reading and interpreting maps, labels Reading short plays/passages/writing summaries

some teachers in the women's college began a local chapter of a nationwide social service sector (called the National Service Scheme, or NSS). This is a nationwide volunteer organization that trains students in the rudimentaries of social work and sends them out in teams to areas (primarily poor rural villages and farms) on special projects that range from inoculating babies in villages, to raising awareness about health issues, to doing investigations on the purity of water in particular regions. The primary aim for starting this project was to involve students in local, community issues, and while none of these projects are directly related to English or vernacular teaching, they are crucial to the pro-vernacular sentiments of the school. One of the teachers who started this social service project at the college specifically mentions the need to "awaken in students the spirit of self-reliance" (FI). As he says:

Having them engaged in an extra-curricular project such as this makes them really strong citizens. They are learning to take pride in so many different things at the same time: their background, their home language, their communities . . . Now they are beginning to see that being in the VM is really valuable: many of them will not be able to do the community work if they did not know Gujarati . . . Suddenly they are realizing that they can be self-reliant with their mother-tongue. (FI)

While "empowering" at this college takes partial form in extracurricular activities (such as the NSS), "reawakening" seems to occur directly in classroom practice, where the focus seems to be more on being pro-vernacular as opposed to anti-English. The following views of a lecturer in Gujarati literature (at the women's college) illustrates this point:

See, I begin with what they already know, and that is Gujarati. For most of these students, Gujarati is their mother-tongue. And once they have learned to appreciate Gujarati literature, once I have re-awakened their interest in stories in their mother-tongue, other kinds of literature open up. Slowly, I get them reading English literary texts, and we draw connections. Recently, I assigned *Sophie's Choice* and they really really loved it. We worked really hard and at the end of it, one of them talked to me about what she had learned from this text and the Gujarati novel we had just finished, about how complex life's choices are and we cannot make simple judgments about where people end up in their lives. I almost cried when she said that. For an 18 year old to say that with feeling meant that something in our class had clicked. Just sparks like that make everything in this place worthwhile. (FI)

"Reawakening" for this teacher, then, is not a matter of "removing English as much as it is of using vernacular and vernacular knowledges as ethical starting points" (note the irony here). While this teacher is not actively anti-English as she explains in the quote above, she very clearly stresses vernacular literature as a way into reawakening and empowering her students.

Winding Down: Articulating Implications

Each of the above local instances, whether they be around the colonial/postcolonial English-vernacular divide or around instances in non-formal domains where civic awareness and change happens, are spaces of unplanned language planning, the micro realms that Egginton (2002) argues need to be part of "formal" language planning, and an integral part of addressing policy studies in terms of their historical frames of reproduction. From a postcolonial perspective, this means educating ourselves about how colonial legacies of divide and rule, of historically reproduced demeaning images, and centuries of mental

conditioning about inferiority finds direct articulation in postcolonial realities.

But this postcolonial orientation to research isn't limited to the South Asian context. It is a perspective that can be applied to any research project in any part of our planet. It does, though, insist on at least two key strains: First, since this framework involves "speaking back" to colonial powers, it ushers in history, a discipline that has been generally regarded as marginal to applied linguistics. In terms of Ramanathan's research in India, it was necessary to gain a fuller sense of how the author was at that point in time—where she fitted in, how she saw herself, others, our planet—and to arrive at a rounder sense of historical conditions that exceeded the history that was taught in K-12. This meant being educated about colonial documents, especially as they pertained to language teaching, largely separatist schooling policies for Indians and the English, ways in which Indian history until 1947 was told to Indians by British historians (which, as mentioned earlier, was by and large unkind), the efforts of Indian historians writing Indian history, and how the author's own family background had differing relations vis-à-vis the English (both of her grandfathers worked for the Raj, but one was a staunch Gandhian, the other an Anglophile). History, then—personal, national, international—is crucial in the postcolonial endeavor.

The second key point that this framework implies is a deep commitment to recognizing how history plays itself out in contexts of inequity. Within applied linguistics, this could mean identifying ways in which unjust conditions get reproduced in everyday interactions (the consistent use of a certain dismissive or patronizing tone in interactions with poorer VM students, for instance), connections between these "smaller" contexts and other structural inequities (reproduced in textbooks, or in the low expectations on the part of teachers regarding VM students), and then further out into the larger culture (ideologies perpetuated by the media that equates EM people with "sophistication" and the VM with being "backward"). Bringing the past into understanding inequity in the present permits insights into colonizing policies that still hold sway; being alert to cross-questioning our own assumptions permits us to address shifts and transformations and agentive acts on the part of teachers and administrators to change conditions.

This postcolonial framework—wherein we recognize, acknowledge, and transform the infinitesimally small ways in which inequity gets reproduced—alerts us to disputes and conflicts around ownership, not just of geographic areas but of representations, and of what is involved in claiming the right to speak for one's self about one's past. The wrestling back of historiography from "colonial powers" is all about assuming the right to claim reception and integrally impacts our engagements in applied linguistics.

English as Lingua Franca

CHRISTIANE MEIERKORD

Introduction

As Bolton (2000, p. 265) points out, “Today it is something of a cliché that English is a global language.” As such, English is no longer used primarily by speakers for whom English is a native or first language (L1). Following its spread into the British settlement colonies, then into the trade colonies, and eventually into almost any nation, English assumes a multitude of varieties today. Many of these are second language (L2) varieties or foreign-language forms of English, whose speakers have an L1 other than English. More and more, English has come to be used for interactions between such individuals. They use English as a lingua franca.

Lingua francas are languages used for communication between speakers who do not share either of their first languages. As a lingua franca, English may, for example, be used for *international* communication between a German and a Japanese, but also *intranationally*, for example between a Xhosa and a white speaker of Afrikaans in South Africa. The community of lingua franca users is, thus, a very heterogeneous one, comprised of individuals from a vast number of different linguistic and cultural backgrounds, and the constellations of speakers interacting in English as a lingua franca are ever changing.

This entry describes the history of research into English as a lingua franca, the central positions that have evolved, and the features which characterize English as a lingua franca at the various levels of language structure and use.

Researching English as a Lingua Franca

The term “lingua franca” originates from the label given to a pidgin that was spoken in the Mediterranean basin from the 15th to the 19th century (Wansbrough, 1996). Like English in its function as a lingua franca, this pidgin was an L1 to neither of its speakers. It was primarily used for restricted purposes in the ports and aboard the vessels that navigated the Mediterranean Sea. And since Lingua Franca was a trade language, the term *lingua franca* was first understood as synonymous with *auxiliary language*, and the use of a language as a lingua franca was strongly associated with its performing very specific and restricted purposes only. In 1953, however, UNESCO defined a lingua franca as “a language which is used habitually by people whose mother tongues are different in order to facilitate communication between them.” This covers a very wide variety of communicative functions. And in fact, today, lingua francas have come—due to increased migration and interlingual relationships—to be employed for a variety of functions, which extend well beyond serving for business communication. As Meierkord and Knapp (2002) point out, the different languages used as lingua francas fulfill a range of different purposes. These vary depending on whether English is used as an *intranational* or as an *international* lingua franca and range from very restricted functions such as Airspeak or Seaspeak to covering refugee interviews (Guido, 2008). English is employed for governmental and administrative purposes in many postcolonial countries and as the medium of instruction in schools and tertiary education,

and it also plays an important role in intimate, personal interactions, as a medium for creative writing, and as a language of religious communities.

Lingua franca communication in English has been studied from many perspectives. Scholarly interest in the use of English as a lingua franca can be traced back to the 1970s and 1980s, when it originated from within the paradigms of applied linguistics and intercultural communication studies. At the time, scholars started to investigate interactions taking place *between* non-native speakers of English. Authors discussed this as a particular type of interlanguage communication, whereas others have placed their emphasis on aspects related to intercultural communication (see Meierkord & Knapp, 2002, for details). Typically authors in those days did not explicitly use the phrase *English as a lingua franca*.

The label gained currency in the 1990s, when the topic and issues related to it were increasingly approached in a more empirical manner, particularly from within paradigms such as discourse analysis, conversation analysis, and interactional sociolinguistics. (An excellent and very comprehensive account of the various pieces of research on English as a lingua franca is available in Lesznyák, 2004.) Nevertheless, the topic has only emerged as a major field of research since the early 2000s, when corpus linguistics allowed for better-informed descriptions of the characteristics of lingua franca communication, and when evidence became available from more diverse contexts ranging beyond the academic to now also include the ones mentioned above.

World Standard English, Common Core, and Interactions Involving Different Englishes

Since the beginnings of scholarly discussions of English as a lingua franca, authors have proposed models to describe how English would perform this function. Some have even suggested that a new variety, restricted in terms of a reduced vocabulary and grammatical complexity, would best serve this function, being easier to learn than the ones based on the native speaker varieties, yet communicatively adequate. One of the earliest proposals for such a variety was Ogden's *Basic English* (Ogden, 1937), which combines a restricted set of grammatical rules with a lexicon of approximately 850 words. Similarly, *Nuclear English*, proposed by Quirk (Quirk, 1985), is characterized by a reduction of homosemy; of the complexity of, for example, restrictive relative clauses; and of the system of modal verbs.

Other authors did not attempt to design a new variety of English as an international lingua franca. Rather, they assumed that English would develop toward a homogeneous new variety without the active intervention of linguistic engineers. Crystal proposes that a form which he calls *World Standard Spoken English* would arise, a form that would coexist with other varieties. Crystal conceives this form of English as characterized by "careful pronunciation, conventional grammar and standard vocabulary" and as a variety which "takes the form, for example, of consciously avoiding a phrase that you know is not likely to be understood outside your own country" (1997, pp. 137–8).

Similar reasoning underlies some of the current discussions of English as a lingua franca, particularly visible in phrases such as "ELF-communication": Around the year 2000, scholars started to investigate lingua francas from a corpus linguistic perspective. Jenkins (2000) searched her corpus of authentic lingua franca English conversations for pronunciation features, both of native and non-native speakers, which led to unintelligibility and misunderstanding in her data. Based on her findings, she argues that a number of sounds, suprasegmentals, and articulatory settings could and should be modified in comparison to the British or General American English model. As a result, she proposes a *Lingua Franca Core*, in which, for example, /θ/ and /ð/ would easily be replaced by /t/ and /d/ or /s/ and /z/ without impeding intelligibility. Similarly the dark /ɪ/ might be replaced by /ʊ/.

A number of projects resulted in the compilation of corpora of English as a lingua franca. For example, Seidlhofer compiled the Vienna–Oxford Corpus of International English at the University of Vienna (Seidlhofer, 2001), and Mauranen a Corpus of English as an Academic Lingua Franca at the University of Tampere (Mauranen & Ranta, 2009).

What these projects have in common is the overall aim of establishing a common core of lingua franca English, similar yet again to what had been conceived in the 1980s. However, while initial results seemed to indicate that such a core could be discerned, with features identified including a lack of third person singular *-s* to mark subject–verb concord, and a lack of tense inflections, redundant uses of prepositions, or replacement of infinitive constructions with *that*-clauses, it seems that this approach has not convincingly yielded results that point to the emergence of a homogeneous variety or core. At the universities of Berne, Basle, and Fribourg, Watts, Allerton, and Trudgill looked at what they had labeled *Pan Swiss English*, a form of non-native English which they held was emerging between native speakers of Swiss German, French, and Italian in Switzerland. However, Durham's (2007) careful analysis of English produced by L1 speakers of German, French, and Italian revealed that it was only with reference to the speakers' preference of *will* over *going to* that there seems to be focusing of the different Englishes toward a homogeneous variety. All other variables did not reveal a tendency to converge across the various L1 groups.

Upon reflection, the above results are not surprising: Interactions involving speakers of different L1s most likely involve very different Englishes, as they have been described from within the World Englishes paradigm ever since the 1980s. Very early and from within that paradigm, Smith (1984, p. 55) assumed that in uses of English as an international lingua franca (reflected in his term *English as an International Language*) individual users will employ a number of different forms of English, such as nativized varieties, and that participants using English as a lingua franca will need to cope with the resulting heterogeneity.

When speakers then engage in lingua franca communication in English—that is, if, for example, an Indian and a Japanese or a German and a Kenyan interact in English—this heterogeneity can best be described as what Meierkord (2004, 2012) has called “Interactions across Englishes” (IaEs).

IaEs as Heterogeneous and Involving Ever New Speaker Constellations

Given that speaker constellations are infinitely kaleidoscopic, IaEs occur in ever new constellations of Englishes and are highly heterogeneous. They include many different Englishes, all of which may be spoken at highly diverse levels of proficiency. Figure 1 illustrates those types of Englishes which can frequently be found in IaEs.

When English is regularly used for *intranational* communication, it has frequently developed into a nativized variety. In these, transfers from the speakers' mother tongues, which occur at the different linguistic levels, eventually stabilize, leading to new developments at all levels of language; for example, *He came to my office by four o'clock* (Nigerian English, McArthur, 2003, p. 279) or *One boy give a report to the teacher every morning* (Philippine English, McArthur, 2003, p. 346). Also, English is adapted to a new sociocultural context, as is most apparent in the lexicon of these varieties. For example, speakers of English in Nigeria have coined the expression *head-tie* to denote a piece of cloth worn around the head by the women in the country. The individual indigenized varieties spoken throughout the world have been thoroughly documented in a vast number of publications. However, the use of English as an *intranational* lingua franca almost always implies that speakers of various, at times mutually unintelligible, L1s interact. Often, their different L1s are reflected in their Englishes, for example in Afrikaans English, Black South African English, and South African Indian

Figure 1 Interactions across Englishes

English. However, not much research has so far been carried out on the processes that characterize intranational IaEs.

Speakers of indigenized Englishes are also frequently involved in *international* interactions conducted in English as a lingua franca. Additionally, these interactions may involve speakers who have predominantly acquired English in a classroom context only and who have not fully acquired English. Their unstable interlanguages are approximative, transitional systems, which reflect the developmental stage of the individual learner. Their productions often contain structures which differ from both their L1 and standard varieties of English. Furthermore, they may be characterized by communication strategies, employed to compensate for deficits in the L2. For example, speakers use paraphrases to express lexical concepts when their interlanguage does not yet contain a specific lexical item.

Speakers potentially take their different Englishes into IaE, with all the features associated with them. As a result, IaEs are highly variable. The next section discusses what research has found to characterize speakers' factual behavior in these interactions.

Characteristics of IaEs

The characteristics of lingua franca communication in English have been investigated at the levels of vocabulary, syntax, and discourse. Meierkord (2005) documented that the lexicon of IaEs receives only very limited input from indigenized Englishes, such as Nigerian or Indian English. At the same time, it contains only few phrasal verbs or idioms which are usually held to characterize British or American English. In cases where these are used, speakers at times employ a form which has developed in their regional varieties. For example, a Nigerian speaker used *I wish you sleep off, so you can't go again, and you come back in*, where *sleep off* denotes the meaning 'sleep away'. The type-token ratio (7.95) of the conversations indicates that speakers in these IaEs use a restricted vocabulary. The analyses also revealed that speakers seldom employed derived or compounded words and thus use a simplified vocabulary, in comparison to native speakers of English. Very seldom, speakers creatively form new lexical items such as *misdecision* 'false decision') or

pressurous 'full of pressure'). In excerpt (1), a Pakistani speaker uses the items *supermarket* and *Saturday market* to refer to Camden Town flea market, since he does not know the item *flea market*.

- (1)
- 01 Rashid: I went to supermarket.
 02 Anja: Supermarket, wh[at supermar]ket?
 03 Rashid: [I mean this-] I mean..you said to this..Camden
 04 Town market.
 05 Anja: Hm?
 06 Rashid: This Cam[den Town.]
 07 Anja: [Camden] Town market. It's not a supermarket.
 08 Rashid: Well, Saturday market.

In sum, the lexicon presents itself as reduced and culturally largely neutral. At the same time, it is unstable and heterogeneous in that items and strategies vary according to the participants of the individual conversations.

As regards grammar or syntax, Meierkord (2004) found that in her informal conversations speakers used very heterogeneous Englishes. Their productions were characterized by an overwhelming correspondence to the patterns of the traditional standard Englishes (British and American English); in fact, 88% of all utterances showed this. This correlated with the speakers' proficiency and peaked at 95% with those speakers from the Expanding Circle (Kachru, 1985) who had reached a very high proficiency level. Interestingly, speakers from Outer Circle countries who might potentially have used their localized Englishes stuck to standard varieties 94% of the time, at the level of grammar. Those utterances which differed from the standard grammars were characterized by transfer phenomena, developmental patterns, and nativized forms, while simplification, regularization, and leveling processes could also be observed. Speakers predominantly used grammatical constructions that conformed to those found in the standard varieties. Also, they preferred simple clauses and coordination over more complex sentences.

Similarly, at the level of pragmatics, speech acts were performed in a highly uniform manner and with particularly low variation in ritual speech acts. Excerpt (2) illustrates that high-frequency formulas are often employed to utter ritual speech acts such as leave-takes (lines 9 to 16). More recent studies (such as the ones collected in Mauraen & Ranta, 2009) largely confirm these various earlier findings.

- (2)
- 01 Anja: What did she put inside? . . . Apricots?
 02 Tsu: Peaches.
 03 Anja: Not bad.
 04 Karwan: I think it's peach.
 05 Tsu: Peaches.
 06 (1m 40s)
 07 Tsu: Right. I finish this. Too sweet.
 08 (18s)
 09 Tsu: See you everyone.
 10 Torben: ((clears his throat))
 11 Karwan: Yeah.
 12 Anja: See you.
 13 (1m 6s)
 14 Karwan: OK. See you.
 15 Torben: See you.
 16 Anja: See you.

While the above findings indicate that individuals engaging in lingua franca communication in English use fewer lexical items and grammatical structures than are potentially available in (a) the standard varieties and (b) the local indigenized varieties associated with their home countries, other studies have looked at how speakers cope with the fact that they speak different varieties and the fact that they may not possess the full array of linguistic options. As explained above, this was one of the original motives for research into English as a lingua franca.

Individual authors, particularly Firth (1996), identified a number of strategies which interlocutors use to deal with the heterogeneity of IaEs successfully. As he and others (Meierkord, 1996; House, 2002; Lesznyák, 2004) explain, speakers tend to allow for deviations at the levels of grammar or vocabulary: they “let it pass” and “make it normal.” Additionally, they utilize verbal, paraverbal, and nonverbal means available to successfully make up for any restrictions in terms of vocabulary, grammar, or pragmatic competences. At the discourse level, pauses occur frequently between and also within turns, possibly when learners pause to solve production problems. However, long pauses which occur between turns also seem to result from the speakers’ reliance on pauses as turn-taking signals, which implies that they do not sufficiently recognize and produce other turn-taking signals. Laughter has been shown to be employed to substitute verbal back-channeling signals, but also to express insecurity and uneasiness in a situation where linguistic as well as intercultural insecurity is potentially involved. The mutual acknowledgment of difficulties and differences also results in highly cooperative behavior, particularly with participants who are not fully proficient. Speakers frequently co-construct turns, completing one another’s utterances, and negotiate meanings. Additionally, the current speaker is supported through back channeling and links are established through a high amount of gambits.

Conclusions

Interaction in English as a lingua franca implies communication between speakers of different Englishes: indigenized forms, non-native or learner varieties, and immigrant Englishes, as well as pidginized and creolized Englishes, potentially meet, and as a result interactions in a lingua franca are highly heterogeneous. However, processes of leveling and regularization seem to operate, and, together with cooperative strategies at the level of pragmatics, compensate for potential insecurities and sources of miscommunication. Despite this predominantly successful cooperation of participants in IaEs, there are, of course, instances in which communication is impeded or where misunderstandings may not be resolved, as House (1999) documents.

English for Academic Purposes

LYNNE FLOWERDEW

Introduction

First, it is necessary to examine how the field of English for academic purposes (EAP) positions itself within the wider field of ESP (English for specific purposes). Figure 1 displays the two main subdivisions of ESP: EAP, the main focus here, and, to a much lesser extent, EOP (English for occupational purposes, addressing students' perceived future needs in the workplace).

What sets apart EAP from general English courses, for the most part, is the focus on students' needs encompassing the target situation analysis (objective needs focusing on the tasks and activities students will be using English for) and the present situation analysis (more subjective-type needs attending to personal information about the learners such as previous learning experiences, and so forth, and their current level of competence).

Key debates in the literature on EAP have raised both theoretical and practical issues regarding the essential nature of EAP and its ability to target students' needs. These issues are first discussed and then followed by an overview of the five main approaches (study skills; grammar and vocabulary; discourse/genre; critical; content-based) underpinning EAP pedagogy. A point to note in the following sections is the important influence the work of Swales has had in shaping both the theoretical underpinning and the practical implementations of EAP throughout the last 40 years.

Generic or Specific Attributes in EAP?

Proponents of the "common core" hypothesis maintain that there exists a generic set of skills, linguistic structures, and vocabulary found across a range of academic texts, regardless of discipline and genre, that are transferable from one academic discipline to another. Other EAP researchers, though, most notably Hyland (2002, p. 390), reject the concept of a generic skills set, such as "academic English" or "business English," making a strong case for "specificity" on account of disciplinary variation: "Disciplines have

Figure 1 Subdivisions of EAP (Flowerdew & Peacock, 2001, p. 12, adapted from Dudley-Evans & St. John, 1998) © Cambridge University Press

different views of knowledge, different research practices, and different ways of seeing the world, and as a result, investigating the practices of those disciplines will inevitably take us into greater specificity.”

EAP researchers from opposing camps have analyzed computerized corpus data (i.e., large databases of academic text) to support their respective positions. For example, Coxhead’s (2000) corpus-based research of vocabulary items in a 3.5-million-word corpus composed of written academic texts drawn from the disciplines of arts, commerce, law, and science supports the “common core” hypothesis, with its extraction of common vocabulary items forming an academic word list (AWL), also supported by Paquot’s (2010) research on learner and expert academic language. However, Hyland and Tse’s (2007) corpus analysis of seven key genres of academic writing (research articles, textbooks, doctoral dissertations, and so on) points to a discipline-based specific lexical repertoire. Other ESP studies of textbooks and research articles in which word lists from specialist disciplines are compared with Coxhead’s academic word list also favor sets of discipline-specific lexis (many of these studies have been published in *English for Specific Purposes*). Perhaps, in this debate, a key point to note is that all these studies rely on different types of corpora and use different software for analysis, so it is not surprising that the findings differ and that this area is still fraught with controversies regarding the essential nature of EAP.

Arguments for and against implementing generic (“wide-angle”) or specific (“narrow-angle”) EAP courses are summarized in Basturkmen (2010). For example, a highly specific EAP course may not be very motivating for undergraduate students, but be deemed as highly relevant by postgraduate students engaged in writing dissertations. Moreover, often, in reality, it is not logistically possible to implement a narrow-angle course since the students are not a homogeneous group. The ongoing debate on common core versus specificity is an important one and will be taken up in the following discussion on the different pedagogic approaches to EAP, including a brief overview of their philosophical and theoretical orientations.

Approaches to EAP

Study Skills

As noted by Dudley-Evans and St. John (1998, p. 24) the main principle underlying the teaching of study skills (e.g., taking notes in lectures, reading textbooks) is that knowing grammar and vocabulary are not sufficient conditions for developing the ability to function in an academic environment and that “there is a need to address the thought processes that underpin language use.” So, for example, a course focusing on academic reading skills would aim to target skills such as reading for relevant information and using contextual clues. Textbooks such as Jordan’s (1990) *Academic Writing Course* are based on the functional-notional approach to materials, with units built around rhetorical functions such as comparison/contrast, cause/effect, and so forth. Published study skills materials in the 1990s often made use of simplified or specially written texts by the writer, although nowadays it is generally agreed that authentic texts are the preferred option in EAP to reflect the target language derived from the needs analysis. MICASE (Michigan Corpus of Spoken Academic English) and its British counterpart BASE (British Academic Spoken English), consisting of authentic lectures and seminars, have been exploited for devising study skills materials which take a generic perspective on skills. Such an approach is seen by Swales and Feak (2000) as having certain advantages such that students have an opportunity to compare and share academic experiences.

While more narrow-angle courses also have their respective advantages, a focus on disciplinary specificity may not be the only aspect to address in academic interactions.

Ethnographic studies of various oral modes of academic skills have pinpointed sites of communication breakdown. For example, Flowerdew and Miller (1995), based on their analysis of lectures in a second language environment, put forward a four-dimensional concept of culture to explain cross-cultural breakdowns: ethnic, local, academic, and disciplinary. An approach which encompasses a socially situated understanding of the academic communicative setting can thus also help to inform the EAP teaching and learning situation. See Flowerdew (2002) and Hyland (2006) for more details on ethnographic approaches to EAP. Tribble (2009, p. 401) notes the more home-grown nature of EAP materials displaying “a growing independence from published course materials,” no doubt contributed to by a more localized perspective on EAP materials. Such an ethnographic dimension to EAP pedagogy would serve not only to address needs uncovered by the objective needs analysis but also to take into account more subjective-type needs associated with the learning and teaching situation.

Grammatical Structures and Vocabulary Items

Before the advent of the broad study skills approach in the 1980s, the field of ESP was first conceived in terms of a “register analysis” approach, specifically focused on EST (English for science and technology). The basic premise of this approach is that while scientific and technical writing use the same grammar as that of general English, certain grammatical structures and vocabulary items predominate. A seminal study by Barber (1988), based on “lexicostatistics,” showed that the predominant tense is the present simple and the passive voice is used more frequently in EST than in general English. In this approach, teaching units are built around grammatical structures such as the use of the passive for process descriptions.

Barber’s research also highlighted the importance of subtechnical—that is, core—vocabulary (general vocabulary that has a higher frequency in a particular field), such as “consists of” and “contains” in EST. This kind of vocabulary has been usefully defined through corpus-based analyses of particular EAP fields. Moreover, it is to be noted that vocabulary, rather than grammar, has been the focus of much recent EAP instruction for which corpus data have been exploited. For example, using a corpus of academic seminars on language and gender, international law and entrepreneurship, Jones and Schmitt (2010) devised a set of vocabulary materials targeting technical (e.g., “regional body”), general (e.g., “at the outset”), and colloquial (e.g., “gut feeling”) discipline-specific vocabulary and phrases in the entrepreneurship seminars.

Discourse/Genre

Following the “register analysis” approach, the next major development in EAP, particularly in the field of EST, took a discourse-based orientation, linking particular forms with particular rhetorical functions, such as defining, classifying, and so forth (Trimble, 1985), an approach underpinning much of the academic study skills materials described in the first section. However, the first discourse-based study to truly examine “specificity” in EAP, in Hyland’s sense, was Tarone, Dwyer, Gillette, and Icke’s (1981) study with its focus on the rhetorical and communicative purposes of the passive in research articles from the field of astrophysics.

Tarone et al.’s study marked a watershed in the field of EAP, and was followed by Swales’s (1990) development of the concept of genre (a genre is conceived as a particular communicative event which has a specific communicative purpose recognizable by the users of the genre’s discourse community). Genre analysis has had a profound and lasting influence on EAP applied linguistics research and teaching, such as Swales’s CARS (create a research space) model for article introductions, as outlined in Table 1. The handbook

Table 1 A CARS model for article introductions (Swales, 1990, p. 141)

Move 1: Establishing a territory

- Step 1 claiming centrality (and/or)
- Step 2 making topic generalization(s) (and/or)
- Step 3 reviewing items of previous research

Move 2: Establishing a niche

- Step 1A counter-claiming (or)
- Step 1B indicating a gap (or)
- Step 1C question-raising (or)
- Step 1D continuing a tradition

Move 3: Occupying the niche

- Step 1A outlining the purposes (or)
- Step 1B announcing present research
- Step 2 announcing principal findings
- Step 3 indicating RA (research article) structure

on thesis and dissertation writing by Paltridge and Starfield (2007) aptly illustrates the Swalesian concept of move structures applied to pedagogy. Building on Swales’s work on genre, Johns (1997) advocates a “socioliterate” approach to academic literacy in which students come to grips with academic genres through drawing on their own experiences with genres and discourse communities to aid them in interpreting, producing, and critiquing (see Benesch 2001) texts from various academic contexts.

Another textual approach to genre is that of the “Sydney school” associated with Halliday’s systemic-functional linguistics (SFL), in which genres are defined as staged, goal-oriented social processes. An example of the SFL approach to pedagogy is Hussin’s (2002, p. 30) task-based instructional model for writing nursing care plans in the clinical part of trainee nursing programs in the academy (see Figure 2).

Critical

All the previous approaches imply a pragmatic orientation to EAP: that is, facilitating students to participate effectively in the academic community. However, proponents of a

Figure 2 A genre approach to nursing care plans (Hussin, 2002, p. 30) © TESOL 2002

critical pedagogies approach take issue with this view of EAP for being too accommodationist toward power relations in the academy and failing to challenge the established status quo. As a result, the content of EAP courses has been criticized for its imposition of Westernized values and ideologies and also the lack of value attached to the culture and rhetorical practices of the students' native language.

This more critical approach led to contrastive rhetoric coming under attack, defined by Connor (1996, p. 5), a leading researcher and practitioner in the field, as "an area of research in second language acquisition that identifies problems in composition encountered by second language writers and, by referring to the rhetorical strategies of the first language, attempts to explain them." However, Connor (2004, p. 272) has more recently proposed a new term, *intercultural rhetoric*, to embody "the current dynamic models of cross-cultural research." Mauranen (1993), who compared the rhetorical strategies of Finnish and Anglo-American writers of academic research reports in the field of economics, was one of the first to call for greater tolerance toward different rhetorical styles most likely due to cultural factors. Since then, this greater acceptance of different rhetorical styles, and consequently the use of English as a lingua franca in the academy, has been gaining ground internationally; see the special issues of *Journal of English for Academic Purposes* on "Contrastive Rhetoric in EAP" (October 2004) and "Critical English for Academic Purposes" (June 2009). A slightly different perspective on this critical pedagogies debate is provided by Starfield (2004, p. 139) who used concordancing as "a strategic engagement with technology" as a means of further exploration of issues of power and identity in academic thesis writing. Starfield reports that students experienced a sense of empowerment when they realized they had readily available access to the language resources of authoritative English to expropriate for their own means.

Content-Based Instruction

The content-based instruction (CBI) approach is radically different from all the other approaches described above in that the main focus of instruction is the acquisition of disciplinary content (Brinton, Snow, & Wesche, 2003), thus providing another perspective on this issue of "specificity." In common with other EAP approaches, CBI makes use of authentic texts, but the syllabus is organized around subject content. While language is usually approached holistically, the balance between language and content has been an issue for debate. Skills are usually integrated, but see Evans, Hartshorn, and Anderson (2010) for CBI materials targeting reading of biology textbooks.

Conclusion

The five main approaches to EAP pedagogy together with their respective theoretical underpinnings have been discussed in relation to objective and more subjective target needs. Issues regarding a common-core (i.e., generic) versus disciplinary-specific pedagogy have also been raised. Two key areas which will have influence over the conceptualization and implementation of EAP in coming years are the increasing interdisciplinarity of subjects: for example, physics in medicine, and the role of English as a lingua franca with the internationalization of academia in the continually evolving and dynamic field of EAP.

English for Business

CATHERINE NICKERSON

Introduction

English for business is referred to in the academic literature in a number of different ways, including English for business, business English (BE), English for specific business purposes (ESBP), international business English (IBE), and business English as a lingua franca (BELF). English for business can be considered as English for academic purposes (EAP) when it is taught as part of academic training. Many of the research methods used in EAP are also standard in investigating English for business. When English for business is taught in professional business settings, it overlaps with English for occupational purposes. Other areas of research that are relevant to English for business are sociolinguistics, intercultural communication, discourse analysis, and business communication.

English is used routinely for commerce and industry across national borders in all parts of the globe (e.g., Vandermeeren, 1999, discusses the European context; Li So-mui & Mead, 2000, focus on Hong Kong and the interaction between English, Cantonese, and Mandarin; the papers in Forey & Lockwood, 2010, report on the call center industry worldwide, etc.). It is almost always chosen as at least one of the official corporate languages used within a multinational corporation, even if both the corporation and its head office originate and are located in a non-English-speaking country. Such corporate language policies have had varying degrees of success. For example, Louhiala-Salminen, Charles, and Kankaanranta (2005) look at corporate mergers in Scandinavia and the successful introduction of English as a business English lingua franca by the Swedish and Finnish parts of the two corporations they study; Tanaka (2006) discusses the increasing use of English in corporations in Japan and the problems that this has caused for some Japanese employees; Gimenez (2002) reports on the impact of using English within the Argentinean subsidiary of a European multinational and the difficulties posed for many of the employees at the subsidiary as a result. In addition, English is often used in business transactions within national borders, in countries where it is one of the multilingual choices available as a result of that country's colonial past and shared history with an English-speaking country, for example in India, the Philippines, and Singapore, and it may also be used for pragmatic business reasons because there is an extensive expatriate business community who are unfamiliar with the local business language, as is the case in countries such as the United Arab Emirates. Finally, large parts of the world, for example the United States, Australia, Anglophone Canada, the United Kingdom, do business primarily in English, as it is the first language of most of the population. There are many millions of business English users across the globe who speak or write English on a daily basis to get their work done, and hundreds and thousands of business transactions are initiated, negotiated, and completed using English. Exactly how many people are involved is difficult to establish because of the wide range of different methodologies that have been used to measure this. In terms of economic value, however, a recent report suggests that first language speakers of English alone account for almost 30% of world gross domestic product (Graddol, 2006). The real value is clearly much larger if second and foreign-language users of English are also taken into account. Although English may ultimately be replaced by languages such as Chinese,

Hindi, or Arabic as *linguae francae* in international business, most scholars agree that English will continue to dominate in business contexts at least for the next 50 years.

Because of its dominance, English has been analyzed more than any other business language. In the past two decades, researchers interested in English for business have looked at a variety of different forms of business communication, including business meetings, negotiations, presentations, sales letters, application letters, fax communication, e-mail, annual reports, reports, telex communication, advertising texts, and Web pages. They have also studied the consequences of using business English in such a widespread way across the globe, particularly for those people who do not speak it as a first language. Some researchers have focused only on how English is used for business (e.g., Boden, 1994, looks at business meetings in the United States; Hyland, 1998, looks at annual general reports in English produced by corporations in Hong Kong), while others have looked specifically at how English is used in business settings by speakers of other languages, including the challenges they face and the strategies they use to meet these challenges (e.g., Connor, Davis, & de Rycker, 1995, is a contrastive study of application letters written by US and Belgian writers). The findings of the studies in this second group have contributed both to our understanding of business English as an LSP (language for specific purposes) and also to our understanding of second language acquisition. A third group of researchers have contrasted English with other business languages, including Finnish (Yli-Jokipii, 1994), Chinese (*Putonghua*) (Zhu, 2005), and Arabic (Al-Ali, 2004), amongst many others. These studies not only tell us a great deal about business English, they also highlight the importance of national culture to national business culture in business interactions.

Much of the research has been data driven and because of this, it has been characterized by reference to a variety of different research approaches (see also the influence of Vijay Bhatia below). The remainder of this article will first review the main approaches that have been taken in researching written and spoken business English. It will go on to talk about those studies that have focused on the effects of using English, and it will conclude with a discussion on the future of English for business.

Researching Written and Spoken Business English

For written forms of communication used in business, the type of analysis generally referred to as genre analysis has been extremely influential on what we know about English for business and the ways in which we research it. Vijay Bhatia's 1993 publication *Analysing Genre: Language Use in Professional Settings*, extended an existing ESP (English for specific purposes) approach that had been pioneered by John Swales for academic writing, and reapplied it to some of the most important forms of written business communication that were in use at the time, such as application letters and sales letters. Genre analysis focuses on the communicative purpose of a text and attempts to explain how the content and form of the text contribute to this purpose. In his later publications, Bhatia has continued to develop this work with particular reference to strategic language use on the part of individual genre users and to the complex relationship between text and context. Many applied linguists interested in the written forms of English for business have been and continue to be influenced by Bhatia's ideas, including Leena Louhiala-Salminen (fax communication), Ulla Connor (application letters), Catherine Nickerson (e-mail correspondence), Anne Kankaanranta (e-mail correspondence), Yunxia Zhu (sales letters), and Elizabeth de Groot (annual general reports). Outside of genre analysis, Johns's study of cohesion in different types of business discourse is historically important (Johns, 1980), and the contrastive studies of business correspondence by Jenkins and Hinds (1987) and by Yli-Jokipii (1994) are landmark studies for the 1980s and 1990s respectively.

For spoken forms of communication, conversational analysis (CA) and discourse analysis (particularly the approach pioneered by John Sinclair and Malcolm Coulthard at Birmingham University in the United Kingdom) have been influential on our understanding of the ways in which English is used for business purposes. An important, and very accessible, study of spoken business English that uses a CA approach is Boden's account of meetings in the United States in three different sectors: health, academia, and business (Boden, 1994). CA allows Boden to deconstruct the interactions that take place within the meetings, and in doing so she shows the contrast between the three sectors, as well as the way in which the organizations involved are shaped by language use. Mirjaliisa Charles's work on British business negotiations using discourse analysis (e.g., Charles, 1996) has also been very influential, as has the work by Bargiela-Chiappini and Harris on meetings and other forms of spoken business communication, both in English and in other languages (e.g., Bargiela-Chiappini & Harris, 1997). In the course of the last decade, much research looking at spoken forms of business communication in English has tended to take a similar discourse approach, focusing on the specific types of strategies that business people use to communicate. The 2004 study by Poncini, for instance, focuses on the evaluation strategies used in multicultural business meetings held in English, alongside other languages (Poncini, 2004). It shows that the use of evaluation can help to build a sense of shared common purpose between the meeting participants, even if they do not speak English as a first language. Likewise, the study of English as a business lingua franca in Finnish and Swedish corporate mergers by Louhiala-Salminen et al. (2005) shows that different discourse strategies are associated with different national cultures, and that these may be interpreted by the participants in a meeting in both positive and negative ways. Finally, the Language in the Workplace Project, based at Victoria University Wellington in New Zealand, is an ongoing study of communication in the workplace, directed by Janet Holmes, which uses a number of different methodological approaches. The methodologies used in the LWP project, together with the project's findings, are accessible via the project's Web site, together with a range of publications related to the project (www.victoria.ac.nz/lals/lwp/).

The Effects of Using English

In the course of the last decade, a small group of researchers has begun to investigate the effects of using English in business: they have talked to business people who speak English as a second or foreign language about what their experiences are if they need to use English, and they have talked to the users of different kinds of written texts about their attitudes to those texts and the ways in which they are influenced by them. In the first group of studies, the work by Rebecca Marschan-Piekkari from the mid-1990s onwards has shown that business people may face a number of complex challenges when they are asked to use English to complete their work-related tasks, particularly those who work in multinational corporations. Marschan-Piekkari has discussed the evolution of shadow structures that coexist alongside official corporate structures, as a direct consequence of the requirement to use English. These are unofficial hierarchies that are determined by an individual employee's level of language proficiency in English and not by their actual seniority within the corporation. The survey by Charles and Marschan-Piekkari (2002), for instance, looks at the impact of adopting English in a multinational corporation as a global corporate language. The findings reveal a number of problems directly related to the use of English, such as difficulties in comprehending accent, insufficient translation of English into the languages used at subsidiary companies, and feelings of isolation due to a perceived lack of proficiency in English. Other studies that have looked at the effects of opting for English in business meetings and other types of communication in multinational

corporations include Gimenez's (2002) study of the use of English at an Argentinean subsidiary company and Tanaka's (2006) study of the use of English at a corporation in Japan. Although all these studies identify a series of communication difficulties that lead to feelings of disempowerment as a result of the decision to use English, they also suggest that many business people are able to use English effectively and successfully despite the fact that it may be only one of several languages that they speak.

In the second group of studies investigating the effects of using English, the emphasis has been on the response of readers to business texts in English, often in an experimental setting. In these studies a group of people were presented with business texts that use English, such as an advertisement in English, and they have then been asked to speculate on how the use of that English influences them, for example on their attitude to a product presented in an advertisement in English or on their willingness to buy that product. Some studies have also tested whether people are able to comprehend or translate the English in the texts that are presented to them. The 2005 study by Nickerson, Gerritsen, and van Meurs is an accessible example of this type of study conducted within the European context; it looks at the use of English in glossy advertising and its impact on the relevant consumer population (Nickerson et al., 2005). The findings of studies like these suggest that the use of English for business may not always be appreciated if it is used in promotional texts targeted at a non-English-speaking audience. More importantly, they also suggest that the English may not always be understood by the people that those texts are trying to reach.

English for Business in the Future

The teaching and training of English for business is a multi-billion-dollar industry and several applied linguists have referred to this as the *commodification* of language. This means that English is exploited as a commodity for commercial purposes in teaching and training packages, without considering the needs of real users in real business contexts. An internet-based search using the terms *English for business* and *business English*, for instance, provides around 457 million and 537 million hits respectively, many of which are references either to commercially produced teaching or training materials, or to commercially run training courses. Although many users of English for business across the globe will never interact regularly with Western business people, and will use English primarily in their own region, such as the Asia Pacific region, or indeed within their own country, for example India, Hong Kong, Singapore, Malaysia, the Philippines, British and American varieties of English still tend to dominate both in teaching materials and training courses. There is also considerable evidence that the business English that is presented in commercially produced materials in fact has little to do with real business English; several researchers have shown that there is a large difference between what real business people say or write and what the commercially produced materials present as models that are then used to teach them (e.g., Nelson, 2006).

English for business in the future will be shaped by (a) the need to know more about intercultural interaction and how this impacts commerce and industry, (b) the need to know more about what real business people say and write across the globe, and (c) the need to know more about multimodality and what this means for Web-based forms of business communication. The *flattening* of the world and the increasing influence of emerging economies such as India and mainland China will lead to more multilingual workplaces and more multinational organizations. English for business will continue to play an important role as both an international and intranational business language, and at the same time it will become increasingly disassociated from its Anglo-Saxon roots. This means that in situations where English is used either as a lingua franca or as an international business

language it will invariably function as a “neutral and a shared communication code” and the business people who use it will not consider themselves either as “non-native speakers” or as “learners” (Louhiala-Salminen et al., 2005, p. 404). Because of this, an understanding of national cultures in general and national business cultures in particular will become extremely important, alongside business English, in developing the language skills and intercultural communicative competence that is required to do business effectively. Related fields such as intercultural communication and intercultural interaction will continue to be influential (see especially the work of Helen Spencer-Oatey, e.g., 2000) and there will be an increasing need to produce textbooks that incorporate the research that has been conducted in international business settings in the last 20 years. Finally, as English continues to dominate Web-based forms of communication, an understanding of the role played by multimodality together with business English, for example in the combination of text, visuals, and sound, will underpin the development of more complex and dynamic forms of business communication in the future. Several applied linguists have begun to deconstruct the characteristics of different forms of multimodal business communication that are often produced in English, and it seems likely that this line of inquiry will continue to be of interest in the future.

English for Medical Purposes

JOHN SKELTON

Introduction

English for medical purposes (EMP), as applied linguists would call it, and communication skills in medicine, as medical educationalists would call it, have developed alongside each other over the last 40 years, though not always being fully aware of each other. Both EMP and communication skills are burgeoning disciplines; among fairly recent summaries of a variety of areas are Gotti and Salager-Meyer (2006), Ainsworth-Vaughn (2001; on doctor–patient communication), Fleischman (2001; on medical language), and Shi (2009).

But working across two traditions has its problems. As Roberts and Sarangi point out, “the vast majority of discourse specialists and applied linguists work from . . . outside [the profession] in,” and therefore face issues “of identity, roles, authority and credibility” (2003). The history of EMP to some extent exemplifies the lost opportunities which follow from this.

The Doctor–Patient Encounter

A recognition that the healing art involves more than the use of clinical remedies is as old as the practice of healing itself. After all, at times when the healer has had limited capacity to alter the course of nature (that is to say, for most of human history) what mattered was self-presentation, the ability to inspire confidence, sometimes through the presentation of medicine as a dark and mysterious art. The great Canadian physician Sir William Osler once visited a sick child wearing his academic gown, and being told that the child therefore thought he was a magician, visited him for 40 consecutive days, always in his gown. The child recovered. This is part of “bedside manner,” a phrase commonly attributed to the Victorian cartoonist George du Maurier, in the 1880s. Osler’s own thoughts on the appropriate bearing for the doctor (“imperturbability” without “hardness”) were delivered in his magisterial lecture, “Aequanimitas” (1889/1932).

Today these areas are reflected in the drive towards “patient-centeredness” in the medical encounter (see, e.g., the work of the Picker Institute) which echoes general educational views on the importance of learner-centeredness. Indeed, they are the manifestation of the same principle in the different professions of medicine and education: a belief in the importance of the person being served rather than the expert.

The need for a holistic approach to the medical encounter has been widely accepted as a principle since the 1970s, though the evidence building up at that time was that doctors either chose not to, or did not know how to, undertake holistic discussions. It is now routine to recognize that all doctor–patient encounters have a clinical, social, and psychological dimension. For example, a patient may be diagnosed with multiple sclerosis (MS) and offered *clinical* support (drugs). But the MS may impact on the patient *socially* (through inability to work) and *psychologically* (the patient is stressed). It should be added, however, that while this model suits chronic illness, it has less meaning for clinical encounters within the acute specialties—a doctor is unlikely to waste time exploring the patient’s feelings in the middle of a medical emergency. This area is less well-researched, and infrequently taught.

Research into the Doctor–Patient Encounter

The issue of how to describe and explore the nonclinical areas that clinicians need, and of how to be patient-centered, has focused from the 1970s on communication skills.

The central result has been to endorse and teach a list of desirable “behaviors” as “doing” patient-centered interaction, in what is basically a counseling model. This conclusion derives from what is known as “process-outcome” research, and the bulk of literature reviews in the field have focused on it. The behavioral findings are detailed in Kurtz, Silverman, and Draper (2005), and in Maguire and Pitceathly (2002).

A major study from the 1970s was that by Byrne and Long (1976), who collected and transcribed over 2,000 consultations in primary care (i.e., family medicine) settings, and identified six “phases of the consultation.” These were: establishing a relationship, discovering reason for attendance, conducting verbal/physical examination, considering the condition, detailing further treatment/investigation, and ending the consultation. This study was enormously influential, but though the authors were pioneers within medicine, they had no particular expertise in the type of research they were employing (see Mishler, 1984).

The most influential of the many other attempts to identify the structures of the consultation is the work of Debra Roter, who has developed and applied Roter’s Interaction Analysis System (RIAS) in a wide variety of settings. The system can, it is claimed, “provide reasonable depth, sensitivity, and breadth while maintaining practicality, functional specificity, flexibility, reliability, and predictive validity to a variety of patient and provider outcomes” (Roter & Larson, 2002, p. 243). Categories in the system, of which there are 39, are divided into “task-focused” and “socio-emotional.” Byrne and Long and their successors, and Roter, thus seek to divide the consultation into thematic areas in a manner not dissimilar to that of genre analysis.

Much of the research is driven by a perception that doctor and patient need better ways of hearing and understanding each other. Versions of conversation analysis or discourse analysis, such as discursive psychology (Edwards & Potter 1992) have explored the issue, and Mishler, in the classic study mentioned above, makes the point with particular elegance. The clinical encounter is where the “lifeworld” of medicine and the “lifeworld” of the patient come into contact.

More recently, too, there has been a great deal of interest in the role of narratives in medicine (that is, in the “stories” patients tell their doctors; Greenhalgh & Hurwitz, 1998). This is perceived in particular to be a way of helping doctors properly to understand what patients mean, and is also another way of recognizing that meetings between doctors and patients are not merely about clinical facts.

Communication skills research has been centered around the process-outcome approach, however, since this seems to offer the kind of cause–effect pattern between observable behaviors (“processes”) and responses that epitomizes objective, empirical study. With qualitative work, acceptability within academic medicine has always been limited, because of the perceived subjectivity of the methodology. There are difficulties with what academic medicine is prepared to count as “evidence” (Brown, Crawford, & Carter, 2006). Teaching, too, has tended to focus on developing specific behaviors, though some approaches (e.g., Makoul, 2001) seek to go further.

The links between process skills and outcome are problematic (Skelton, 2008), however. There is little recognition that any skill may be carried to excess: eye-contact is a “good thing,” according to most studies, but presumably eye-contact for the entirety of the interview is not, and so on. Similarly, specific “behaviors” have generally predictable consequences only at the level of common sense. It’s clearly good practice to encourage patients to be exact (Maguire & Pitceathly, 2002) but it hardly needs research to tell us this.

Writing Medical Research

The study of academic research writing within English for academic purposes (EAP) is hugely influenced by John Swales (e.g., Swales, 1990). The tradition generally derives from a standard social constructionist perspective which Myers (1989) among others drew to the attention of applied linguists. A specific question in more recent times has been the disadvantages that researchers in some parts of the world may experience, not just because they have less access to research funding, but because their language use and understanding of EAP conventions may deprive them of easy access to the global research academy. Salager-Meyer has been a considerable voice here, and has called for, for example, open access and greater representation on advisory boards for “periphery” scholars (Salager-Meyer, 2008). This is normally seen principally as a matter of providing access to less affluent countries, and in part also as an issue of language bias.

Within academic medicine, the driving force behind how research is conducted and written up is the evidence-based medicine (EBM) movement. The movement arose originally through a recognition that much of what doctors actually did—the decisions they made, the drugs they prescribed—relied partly on custom and a level of informed anecdote, rather than research. From the early 1990s, therefore, there has been a great deal of work concerned with developing a better understanding of clinical trials. One aspect of this has been the development of a hierarchy of trials, with the randomized controlled trial (RCT) at the top, and in part this has been linked to an increasing desire to control the way in which findings are presented in the literature. Another important aspect has been the development of the systematic review, a formalized and detailed way of reviewing previous literature which allows researchers to build on previous work with greater confidence. The work of the CONSORT Group has been particularly important in the drive to ensure the careful development of research methodologies, and presentation of findings (see CONSORT, 2010).

The key motivation for controlling the presentation of findings, however, was explicitly to minimize the risk of exaggerated claims being made. The controversy surrounding the MMR vaccine, which started with a paper in *The Lancet*, provides an example with global repercussions. The paper sought to demonstrate a link between the MMR vaccine and autism in children. After aspects of the published study were found to be “misleading” by the UK responsible body, the General Medical Council (GMC) the paper was finally retracted by *The Lancet* in 2010. The possibility of misrepresentation has resulted in sophisticated discussion within the main journals about what Richard Horton, the editor of *The Lancet*, calls “the manipulation of language to convince the reader of the likely truth of a result” (Horton, 1995). Journal editors have in recent years often sought to control the presentation of research by providing a level of detail by way of “instructions to authors” which resembles a kind of move-structure analysis. “Structured abstracts” and “structured discussions” are thus increasingly common.

Talking and Writing About Certainty

Much recent debate in applied linguistics has been concerned with the representation of certainty in academic text, often under the label of “hedging.” This and associated topics within EAP have been taken up particularly by Hyland (1998), and have also been studied specifically within EMP.

However, the concept of uncertainty has a very different flavor within academic medicine, where it has loomed large in recent years. Partly it is seen as a cognitive issue, linked to the study of how clinical decisions are made. It is often suggested that the structure of

the medical curriculum makes it difficult for doctors and students alike to make appropriate decisions. During their training they have moved quickly from one specialty to the next, with few encouragements to stand back and integrate the understanding gained from a placement with a particular specialty into their overall knowledge. Partly also it reflects a growing recognition that doctors often cannot make decisions with certainty because the evidence is insufficient or ambiguous; yet the fact remains that they must enter into dialogue with patients, and explain what they know and do not know, what they are sure of and what they are not. This is true even, and perhaps particularly, of such sensitive areas as talking to seriously ill patients (e.g., in response to the question “How long have I got, doctor?”), or discussion about genetic risk. Thus “managing uncertainty”—part of which is inevitably describing and communicating uncertainty—is perceived as a key element in the role of the doctor, and typically appears in statements issued on behalf of bodies set up to safeguard the patient and define the duties of the profession. Communication teaching in this area is therefore concerned with the appropriate use of the hedging devices studied by linguists, though the linguistic research is unfamiliar to clinical teachers.

Professionalization and the Role of the Doctor

The focus on managing uncertainty is typical of the broader conceptualization of what a doctor is in contemporary medical education. A major focus of contemporary attention is “professionalism” (see, e.g., Stern & Papadakis, 2006). This includes such things as probity, confidentiality, and the like, but also involves general areas of “communication” in a broad sense, with some of these areas being particularly matters of cross-cultural difficulty: for instance, how to work as part of a team in a new setting, and how to use language to present oneself successfully to patients and colleagues as competent, confident, and compassionate. In other words, the question of self-presentation and interaction has broadened out again from “communication.”

Breaking Bad News

If there is one area of communication in which medical students will inevitably be given practice, it is breaking bad news (BBN). This most typically involves telling a patient (for training purposes, normally a role player) that he or she has a life-threatening illness, though as Fallowfield and Jenkins (2004) point out in an authoritative review of the literature, “bad news” need not be potentially terminal. BBN showcases the counseling style of consultation that is usually taught. However, there are other foci of attention, even within the teaching of BBN. For example, students and doctors must be realistic while offering (appropriate) hope, must describe the situation clearly, negotiate and explain the next steps, and be clear about how certain it is possible to be.

BBN, particularly when working across cultures, also presents doctors with difficult dilemmas. For example, the ethical imperative in Western, English-speaking countries is to tell the truth and protect the patient’s confidentiality. But this is not the case worldwide, where doctors may collude with a patient’s family to conceal the true nature of illness from the patient.

Cross-Cultural Aspects of Self-Presentation

BBN is one of many areas, in other words, where cultural expectations may get in the way of particular models of good professional practice.

Cross-cultural aspects of the challenges faced by international medical graduates (IMGs), including aspects of general professionalization, are the subject of a special issue of *Academic Medicine* (2006). As Whelan (2006) points out, even the most “fluent” IMG may find certain

things “baffling.” These include: “the structure and hierarchy of American medicine, the role of nurses and other health care colleagues, the concepts of informed consent and shared decision making, issues of confidentiality and documentation” (p. 177). The list could be considerably extended.

An “unprofessional” doctor may be ethically dubious—cutting corners, demonstrating little respect for patients, and so forth. But where IMGs are concerned there is in addition the question of whether their good intentions shine through: whether they can perform professional behavior, as it is judged in that context. Medical students and qualified doctors (including IMGs) routinely undertake communication skills examinations, usually using role-play simulations, where there is a premium on an overt patient-centeredness. There are, however, many settings around the world where a doctor-centered, more paternalistic attitude might be perceived as representing a reassuring level of competence and confidence.

The fact that IMGs are likely to struggle because consultation styles differ from country to country is typically stressed in the many courses around the world that prepare students for the examinations IMGs have to take in order to practice in, for example, the USA (US Medical Licensing Examination Step 2 test), or the UK (General Medical Council Professional and Linguistics Assessments Board). Even when IMGs have “a very high level of language proficiency,” Eggly, Musial, and Smulowitz (1999) found a “perception by faculty and colleagues of language deficiencies and decreased satisfaction by patients.” They concluded that there was a “need for assessment and training of IMGs in the important area of language skills for doctor–patient communication,” and that this was a task for which EMP teachers were “uniquely suited.”

Finally, one other relevant aspect of professionalism in many parts of the world is the question of dealing with patients from different cultures. The value of translators under these circumstances is fairly well-established, but beyond that, there is the fact that many doctors work in very multicultural environments, where there is no realistic hope that they will understand either all the languages spoken by patients, or the cultures they represent. The need to be aware of major cultural patterns (the different reactions of a Hindu and Muslim patient questioned about alcohol use) while being constantly alert to the individuality of particular patients is a difficult balancing act.

The Future

The agenda for EMP is complex. For spoken language, the battle to get “communication skills” accepted in medical training has been largely won in some parts of the world, but not all. It has, however, been won at just the point when the relationship between professional attitudes and the way these surface as appropriate professional behavior is coming center stage. How professionalism should be identified, and what its real impact is on quality of healthcare, are not really known (despite a generally high level of debate). For written language, the development of the EBM movement has led to the creation of new genres (e.g., the systematic review), and more generally to a renewed focus on how research should be presented, and the globalization of research has led also to the study of such matters as language bias in publication. For both spoken and written language, nevertheless, there are types of communication that remain poorly understood: referral letters, clinical notes, the type of reflective writing increasingly required by medical students, the short communications typical of the ward round, communication between doctors and other health professionals, and so on. Finally, it is worth noting that some existing teaching materials are suitable for both native speakers and IMGs. The British Academic Spoken English (BASE) and Written English (BAWE) corpora (Nesi & Thompson, 2006; Nesi,

Gardner, Thompson, & Wickens, 2007) include examples of text types that students will encounter during academic medical training, for example. Tokyo Medical University (2008) gives open access to a range of authentic consultations with transcripts, multiple choice tests on clinical topics (in English), and reading material: and there are DVD materials available on a wide variety of communication topics (e.g., Hull, Skelton, & Wiskin, 2006).

English for Nursing

SUSAN BOSHER

English for nursing is a specialty within English for specific purposes (ESP), which attempts to understand and describe the many ways in which English is used in the clinical setting in nursing, as well as in nursing education. Needs analyses have been conducted at various levels of nursing education to identify the communicative tasks and language skills necessary for success in the field. The results of these needs analyses have been used to develop materials and coursework for ESL prenursing and nursing students, as well as professional nurses preparing to enter the workforce in English-speaking countries.

English for Medical Purposes

Only recently has English for nursing been recognized as a specialty within the field of English for specific purposes, separate from both English for health care, which tends to address the needs of health-care workers at the lower end of the occupational scale, and English for medical purposes, which focuses on internationally educated doctors, or international medical graduates. Likewise, within applied linguistics, discourse analysis on health-care communication has focused on the doctor–patient relationship, even though nurses are the most widely represented profession in health care and spend the most time with patients (Candlin & Candlin, 2003).

Internationally Educated Nurses and Immigrant Nursing Students

Within English for nursing, the emphasis has tended to be on reentry programs for internationally educated nurses (Hussin, 2002; Frank, Andersen, & Norvell, 2008) and on international students at the graduate level (Cameron & Williams, 1997; Cameron, 1998) despite the fact that the majority of linguistically diverse students in nursing programs today are immigrant students at the undergraduate level (Bosher, 2010b). Although internationally educated nurses have already completed their education in nursing, they may encounter issues communicating effectively with patients and colleagues in a health-care system that is often quite different from the one they trained in. Immigrant students, on the other hand, may be more fluent in spoken English and more familiar with the local culture and health-care system, but they may lack the academic reading and writing skills necessary to successfully complete a nursing degree.

Regardless of the nursing shortages in developed countries and the widely recognized need in nursing education to diversify its workforce, there has been little collaboration between ESL professionals and nurse educators, and, until recently, few support services or courses have been provided on a regular basis to help prepare immigrant students for the academic, language, and cultural demands of nursing programs.

Research in English for Nursing: Discourse and Needs Analyses

Research in English for nursing has generally consisted of two types: (a) identifying the language and communicative skills and tasks of nursing (Marston & Hansen, 1985; Cameron, 1998; Hussin, 2002), and (b) identifying the academic, language, cultural, and social needs of ESL students in nursing programs (Bosher, 2001, 2010a; Bosher & Smalkoski, 2002; Leki, 2003; Bosher, 2006; Hussin, 2008).

In their needs analysis of licensed practical nurses (LPNs), Marston and Hansen (1985) identified forms and functions of language use that students would need in their work: asking questions of clients; describing spatial relationships; using relative clauses to answer questions about a patient or to specify a patient; describing procedures; making requests of patients, nurses, and doctors; and using precise language for charting.

In his needs analysis of international graduate students in nursing, Cameron (1998) identified five categories of need: (a) accuracy in speech production, at the levels of pronunciation, vocabulary, grammar, and discourse; (b) academic performance, including aspects of reading, writing, speaking, and listening, as well as critical thinking and moral reasoning; (c) clinical performance, including five types of communicative behavior: getting information, transmitting information, translating information from one medium to another or from one audience to another, utilizing different channels of communication, and interacting socially as well as professionally in the clinical setting; (d) understanding cultural and dialectal variation in English; and (e) language and socially based inferencing skills.

Hussin (2002), in her needs analysis of immigrant nurses in Australia, identified the following language tasks in nursing: taking a nursing history of the patient; writing nursing care plans; giving and receiving change-of-shift reports; writing progress notes; writing discharge summaries, incident reports, and referral letters; making and receiving phone calls; using language while providing nursing care; teaching patients and families about health care topics and providing care to the patient after discharge; and participating in team meetings about patients. Hussin (2002) also developed an extensive list of informational and interpersonal language skills that nurses need to use to complete these tasks with patients and their families, as well as with coworkers.

In a subsequent article, Hussin (2008) identified four areas of concern with regard to the clinical performance of ESL students in nursing: (a) students were not communicating with patients while they were providing care, (b) students were not indicating when they did not understand instructions, (c) students were not able to pronounce medical terminology clearly, and (d) students were not taking an active role in their interactions and meetings with professional colleagues. In response to these concerns, a program was developed to provide support at five levels: (a) professional development of clinical supervisors, (b) workshops for students before clinical examinations, (c) one-on-one work with individual students on pronunciation, (d) on-site supervision of "at-risk" students in the clinical setting, and (e) development of Web-based materials.

In a needs analysis of ESL students in an associate-degree nursing program, Bosher and Smalkoski (2002) found that the clinical setting posed the greatest challenges for students. The course they subsequently developed focused on the most difficult communicative tasks for ESL students in the clinical setting: asserting oneself with patients, coworkers, and nursing instructors; communicating clearly and effectively with elderly patients; understanding clients who speak nonstandard English; using stress, intonation, and nonverbal communication appropriately; understanding and using small talk with patients; and asking for clarification. The needs analysis also identified other challenges that ESL students face: feeling self-confident and comfortable enough to ask for assistance from other students and nursing supervisors; understanding how culture influences interactions with clients; understanding directions given by instructors and following through with step-by-step

procedures in performance tests and clinical examinations; understanding client protocols and information that is stated about clients during protocols; and documenting appropriately and correctly in clients' records.

Bosher (2006), in her needs analysis of ESL students in a baccalaureate-degree nursing program, assessed the degree of difficulty of 74 academic, language, and culture-related skills and tasks that were identified as necessary for success in the program, using questionnaires developed for both ESL students and nursing faculty. Although faculty reported considerable variation in their experiences with ESL students, faculty and students rated the following tasks or skills as most challenging for ESL students: taking multiple-choice tests; incorporating Western perspectives on culturally sensitive content, such as sexuality and mental health, into practice; using effective reading strategies; asking questions in class; editing papers for grammatical errors; organizing and presenting ideas clearly and effectively in papers; preparing for clinical examinations; asking personal questions of clients; and managing time effectively.

The results of this needs analysis indicate the importance of addressing both academic and clinical skills in course design and materials development in English for nursing (Bosher, 2010b). Academic skills in nursing are similar to academic skills in the social and natural sciences. Nursing students must be able to apply reading strategies and skills to complex reading material, usually in textbook format; apply listening strategies and skills to lectures; take notes to supplement lecture outlines; study effectively for tests; participate actively in discussions; ask questions in class; and write research papers.

In the clinical portion of their nursing courses, students must learn how to complete highly specialized assignments, such as nursing care plans, which have proven to be particularly challenging for ESL nursing students (Bosher, 2001, 2010a; Leki, 2003). These assignments are long and exhaustive and must be completed for each patient the student is assigned to care for. These plans require students to research a client's medical diagnosis and write out a detailed plan of care that reflects the nursing process of assessing the client, identifying an appropriate nursing diagnosis, creating appropriate goals or desired outcomes for the client, implementing interventions to achieve those goals, and evaluating the client's progress toward achieving them. These care plans require a considerable amount of research about the client's medical condition and various nursing interventions and must demonstrate the student's ability to think critically about data collected through both a physical and psychosocial assessment of the patient and information gathered from multiple written sources.

In addition, students need to be able to communicate effectively in the clinical setting (Bosher, 2010b). They need interviewing skills to gather information from clients, therapeutic communication skills to help clients cope with their situation, and assertiveness skills to speak up in difficult situations. Nursing students also need to chart accurately and appropriately the nursing care they provide, and they need to give and receive accurate information during change-of-shift reports.

Discipline-Specific Writing in Nursing

Another area of related research has been writing in the field of nursing. Several studies have sought to identify the genres of writing required in nursing programs (Gimenez, 2008). Other studies have investigated how students acquire discipline-specific literacy in nursing programs (Bosher, 2001, 2010a; Leki, 2003) and in the profession (Parks & Maguire, 1999). Leki (2003) describes the challenges that one undergraduate student encountered with nursing care plans, in part because of difficulties she encountered evaluating the psychosocial needs of patients.

In a study of writing in the profession of nursing, Alster (2004) critiques the generally poor quality of writing in nursing, which unduly influences the writing of nursing students, and argues for a more open approach to writing that would encourage students to write in ways that are both more personally engaging, as well as grounded in critical thinking. She also advocates for an approach that would more actively involve students in creating knowledge in the profession and in critiquing the ideas of others, processes that would help to initiate students into the nursing discourse community.

Assessing Language Proficiency in Nursing

Most recently, there has been research focused on developing a more valid and reliable means of assessing language proficiency in nursing. The Canadian English Language Benchmark Assessment for Nurses (CELBAN) is an occupation-specific language proficiency test (Epp & Lewis, 2008) used with internationally educated nurses who are seeking to reenter the nursing profession in Canada. The test development process included an analysis of target language use, specifically situational language use by nurses and types of language tasks used and the percentage of time spent on each type of task during observations. Findings of this analysis indicate that over half of nurses' time is spent with clients (56%), compared to family (10%) and professionals (34%), and that over half of their time is spent on the following three language tasks: asking for information (22%), explaining (21%), and giving instruction (9%).

Linguistic Bias in Multiple-Choice Nursing Course Exams

The wording of multiple-choice items on nursing course exams has been identified as a major barrier to success for ESL nursing students (Bosher, 2003, 2008). Researchers (Bosher & Bowles, 2008) have investigated the effects of unnecessary linguistic complexity on students' comprehension of test items. Linguistic modification, or the attempt to reduce the linguistic complexity of test items without affecting their construct validity, offers one way to reduce the language load of test items (Abedi & Lord, 2001) and, therefore, to assess more accurately students' knowledge of nursing content.

Conclusion

As nursing programs become more culturally and linguistically diverse, awareness of the need for collaboration between ESL professionals and nurse educators should increase. In addition, there are many ways in which the culture of nursing education needs to change, to create a more welcoming and supportive learning environment for all nursing students (Bosher & Pharris, 2008).

English for Occupational Purposes

ALMUT KOESTER

Introduction

English for occupational purposes (EOP) refers to the specific ways English is used in different work and professional situations. It is often considered to be one of two main subdivisions of English for specific purposes (ESP), the other being English for academic purposes (EAP). Like English for specific purposes or language for specific purposes (LSP), the history of English for occupational purposes is closely bound up with developments within English language teaching and the emergence of courses aimed at preparing students and trainees to use English in specific professional, academic, and occupational contexts. In fact, the term English for occupational purposes is often considered to be synonymous with the teaching of such courses. The growth of EOP as a major branch of ESP can be linked to the emergence of English as an international language or “lingua franca” of business and work.

Because of their practical aim to develop the language and skills needed for work, what is taught in EOP courses should be based on needs analysis, that is on finding out what tasks will be performed in English in the target situation (Dudley-Evans & St. John, 1998). Since the mid-1990s, a considerable amount of research on how English is used in different workplace contexts, especially in business, has been conducted; however, there is not always a strong link between this research and what is taught in EOP courses (Bargiela-Chiappini, Nickerson, & Planken, 2007). This entry will provide an overview of research into English used in different occupational and workplace contexts and will discuss the relevance of this research for teaching EOP.

Surveys in English for Occupational Purposes

An obvious way to discover what communicative tasks people carry out in their work is to ask them. For this information to be useful for teaching EOP, it is important to know which tasks are performed in English, rather than in the national language. Surveys have been carried out in a number of countries to find out such information, for example Barbara, Celani, Collins, and Scott (1996) conducted a survey to discover how English was used in a variety of business organizations in Brazil; and in a more recent survey, Chew (2005) focuses specifically on the tasks carried out by new graduate employees in the banking sector in Hong Kong. In the European context, a widely read magazine for English learners in Germany (McMaster, 2008) conducted a survey among approximately 1,000 readers who use English in their work. The tasks most frequently performed in English, according to the survey results, included reading and writing emails, speaking on the telephone, and reading letters and job-specific literature. Interestingly, the most frequent tasks were not necessarily the ones respondents felt they had difficulty performing in English, as primarily spoken tasks, with telephoning and small talk at the top, were cited in the list of those tasks that were felt to be problematic.

Such surveys are a good starting point for deciding what to include in an EOP syllabus; however, in order to discover what language is used in these workplace tasks, it is necessary to study workplace texts and interactions.

Analyzing Language and Interactions at Work

It is, in fact, quite difficult to specify the characteristics of English for occupational purposes, as this term covers a very wide range of occupations and professions. Many studies have focused on specific occupations, with business, healthcare, and the legal professions receiving special attention. In order to discover what is distinctive about EOP, a useful question to ask is how it is different from everyday language. Drew and Heritage (1992, p. 22) have identified three dimensions of interaction that distinguish institutional talk (of which workplace talk is a subcategory) from everyday conversation:

1. *Goal orientation*: “an orientation by at least one of the participants to some core goal, task or identity . . . conventionally associated with the institution”;
2. *“Special and particular constraints* on what one or both of the participants will treat as allowable contributions to the business at hand”; that is, on what it is considered appropriate to say or how interactions are structured;
3. *“Inferential frameworks and procedures* that are particular to specific institutional contexts”; that is, what is said and done is interpreted against the background of the institutional context.

The impact of these three dimensions is that the language used in the workplace is more restricted in many ways than that used in social interactions. A further characteristic of workplace interactions (and institutional interactions in general) is that they are often asymmetrical (Heritage, 1997); that is, there is often a difference in the relative power or relevant knowledge between the participants, for example between doctors and patients or bosses and employees.

Beyond such general insights into the distinguishing features of language used in the workplace, corpus analysis has provided useful quantitative findings on the characteristics of English for occupational purposes, in particular in business situations, since around 2000. A corpus is a computer-based collection of written or spoken texts, which can be analyzed for recurring linguistic features using a number of analytical tools. Two corpora of spoken workplace interactions are:

- the Cambridge and Nottingham Business English Corpus (CANBEC) consisting of 64 meetings (approximately a million words) from business sectors (mostly in the UK) such as the pharmaceutical industry, information technology, and manufacturing;
- the business subcorpus of the Hong Kong Corpus of Spoken English (HKCSE) consisting of 30 hours (262,000 words) of workplace interactions in Hong Kong businesses.

The latter corpus includes a wide range of workplace situations, such as interviews, service encounters, and telephone conversations, while CANBEC consists mostly of meetings.

By comparing the language used in workplace corpora like this with corpora consisting of social interactions, it is possible to gain an insight into which words, expressions, and phrases are frequent in occupational settings. A comparison of CANBEC with a subcorpus consisting of social and family conversations from the Cambridge and Nottingham Corpus of Discourse in English (CANCODE) revealed some unexpected findings (Handford 2010). Not only were words typically associated with the world of work, such as *meeting*, *business*,

or *order*, more frequent in CANBEC; but so were some fairly general words, for example *problem* and *issue*, as well as grammatical words, such as the pronoun *we*. These findings point to the importance of problem solving as a key activity in the workplace and the emphasis on the group (the team, professional group, or organization), rather than the individual. Such quantitative findings based on the analysis of large amounts of text provide valuable information for course book writers and syllabus designers. Corpus findings are beginning to have an impact on the content of EOP course material, as shown in some recent publications, such as McCarthy, McCarten, Clark, and Clark (2009)—a corpus-informed business grammar.

Besides corpus analysis, which is a fairly recent method for analyzing workplace interactions, discourse analysis, conversation analysis, and genre analysis are frequently used to study the ways in which English is used in occupational settings. Discourse analysis is a qualitative approach to examining how language is used in written and spoken texts within particular social contexts. Conversation analysis is similar; however, it focuses exclusively on spoken interactions and involves a particular method of analyzing such interactions in great detail and attempting to make sense of them from the participants' point of view (see Drew & Heritage, 1992). Genre analysis can be described as a type of discourse analysis that aims to describe the characteristics of particular text and interaction types that recur in specific social and institutional situations and display regular patterning. As language is frequently used in the workplace in specialized types of text (e.g., correspondence and reports of various kinds) or spoken interactions (e.g., meetings, presentations, job interviews), genre analysis is a particularly useful method for describing workplace language. A genre can be described as having a particular communicative purpose (or set of purposes) and a particular structure and lexicogrammatical patterns (Bhatia, 1993).

Workplace genres can be identified at a fairly general level (see Yates & Orlikowski, 1992); for example, a genre such as the workplace meeting occurs across different occupational sectors and is characterized by distinctive, recurring features, such as the role of the chairperson, minutes, and an agenda (even if not all meetings have these features). Other genres are only used in a particular occupation or workplace, and some genre studies have focused on identifying the range of different genres used within a profession or organization and examining how these interact with one another. An example of this is Devitt's (1991) study of all the texts written and used by tax accountants and how these written genres are integral to their work. In terms of pedagogical applications in EOP teaching, identifying the characteristics of genres that are frequent across occupations provides useful insights for courses aimed at heterogeneous groups of EOP learners. On the other hand, for groups of homogeneous learners from the same occupational group or workplace, for example in the case of on-site teaching, surveying, and analyzing the specialized genres used in that particular occupation would be useful for identifying the specific needs of such groups.

The Social Dimension of English for Occupational Purposes

The kind of patterning identified in workplace genres is revealing not only of the language used, but also of the people who use the genres and of how they interact with one another. Genres are used and recognized by groups, not just by individuals, and therefore they tell us a great deal about the groups or "communities," such as occupational groups or co-workers, who use them (see Wenger, 1998, on "communities of practice" and Swales, 1990, on "discourse community"). Researchers investigating workplace discourse using discourse analysis as well as genre analysis have become increasingly interested in the social and

interpersonal dimension and the role played here by language. Examples of research in EOP with such a sociolinguistic orientation can be found in studies deriving from the Wellington Language in the Workplace Project, a database of workplace interactions from a variety of occupational settings in New Zealand, such as government departments, small businesses, and factories (see Holmes & Stubbe, 2003). Social aspects of workplace interactions investigated include power and politeness, humor, small talk, and gender (e.g., Holmes, Marra, & Burns, 2001; Holmes & Stubbe, 2003).

This move toward a more social orientation of research in EOP is paralleled by a more holistic approach to teaching EOP. Whereas in its early days the focus in EOP/ESP teaching was primarily on vocabulary and grammar, it is now more on communicative skills, including social skills. Belcher (2004, p. 173) summarizes this trend as follows:

Perhaps because of their heightened awareness of the array of social, material and affective factors that can motivate and facilitate language learning, and of what language learning can accomplish beyond smoother workplace interactions, some number of on-site EOP specialists now see their role as widening to include more than language teaching.

Nevertheless, there is still a gap between research and teaching in this area (at least as far as can be judged from published course material), and much that can be learned from research findings regarding the language used to perform social and interpersonal functions in workplace interactions (see Koester, 2010).

Conclusion

In sum, English for occupational purposes refers both to the ways in which English is used in workplace settings and to the teaching of courses that aim to prepare learners to communicate in English in occupational settings. With needs analysis at the heart of this kind of teaching, research into EOP is of key relevance to the content of EOP syllabuses and teaching material. The aim of this entry has been to provide an overview of the different approaches to discovering how English is used in workplace settings and to show how the findings from such research can be applied to teaching EOP.

English for Science and Technology

THOMAS ORR

English for science and technology (EST), sometimes called English for science and engineering (ESE), has two definitions. In one, EST refers to the spoken and written English that is needed for work or study in science and engineering. In the other, EST refers to English language education that supports science and engineering.

EST as Language

In the first definition, where EST labels a specific domain of English, EST refers to all of the spoken and written English used in science labs and engineering classes; conferences, meetings, and trade shows; and at factories, corporate offices, and construction sites for academic or professional purposes related to technical or scientific aims. Some of this English is very general in nature, such as small talk before the start of a project meeting. Other forms are highly technical, such as lab reports, design specifications, and patent applications. What makes this domain of language “EST” is not so much the characteristics of the English but, more importantly, the nature of its purpose for work or studies in scientific and engineering fields, which influences the form and content of the English. Success in learning this English is not measured by one’s ability to produce English discourse that reads or sounds like EST, but rather genuine mastery is determined by one’s ability to obtain successful results from using it in scientific and technical contexts. Identifying, understanding, and profiling this English, so that it can be taught, is one of the most important goals of EST research.

EST as Education

In the second definition, where EST designates a specific educational focus, EST refers to both the research of the language used for studies or employment in science and engineering and the development and delivery of training in this language to improve academic or workplace performance. At the introductory levels, EST education is typically designed for non-native speakers (NNS) of English, since the instructional content may simply consist of material that the average educated native speaker (NS) already knows. But at more advanced levels, EST training may also address the learning needs of NS, since technical discourse and documentation is typically unknown by both groups of learners. In applied linguistics, EST is normally considered a specialization within the field of English for specific purposes (ESP), but it also draws heavily upon the expertise of other fields to achieve good results.

History of EST as Education

English language training for study or employment in fields of science or engineering has probably been around for as long as there has been technical or scientific work carried out in English in which people from other language communities have wanted to participate. Unfortunately, few records remain from the language’s earliest years of existence to tell

The Encyclopedia of Applied Linguistics, Edited by Carol A. Chapelle.

us how this English was specifically used, taught, or learned for early technical and scientific activities, but there are some things we do know.

For example, we know that from the 16th to the 18th centuries, nearly all of the technical dictionaries, encyclopedias, and manuals that were used for learning technical English were written by scientists and engineers, while general English grammar and composition was learned from textbooks written by philologists. In 1563, for example, the artist and architect John Shute wrote the first reference book in English on the building design and English terminology of ancient Roman architecture. In the late 1600s, member scientists of the Royal Society (established in 1660) actively taught and wrote in English about scientific procedures and discoveries, in addition to the proper English required to describe them. And in the 1700s, some members of the Royal Society also began to produce technical encyclopedias and dictionaries to provide more detailed instruction. One of these was the *Lexicon Technicum: Or, an Universal English Dictionary of Arts and Sciences: Explaining not Only the Terms of Art, but the Arts Themselves* (1704) written by John Harris, a scientist, mathematician, and theologian. And another with an equally long title that was characteristic of the times was *The Language of Botany: Being a Dictionary of the Terms Made Use of in that Science, Principally by Linneus: With Familiar Explanations, and an Attempt to Establish Significant English Terms. The Whole Interspersed With Critical Remarks* (1793) written by the botanist, conchologist, and theologian Thomas Martyn. Beyond the general English learned from grammar textbooks (e.g., *A Short Introduction to English Grammar, With Critical Notes*, Lowth, 1775), it can be reasonably assumed that most of the additional technical English required for work was probably learned by consulting material produced by technical experts as well as learned through immersion in English-speaking environments and on-the-job training in technical apprenticeships—a useful way to learn workplace English that still remains popular and effective today. This early English training for scientific and technical endeavors was not yet labeled EST, but these beginnings of technical English instruction for specific purposes laid the foundation for most of the developments that evolved thereafter.

The next historical phase in the evolution of EST as a line of educational work took place during the 19th century. In this phase, great changes took place as the industrial revolution began to trigger radical alterations in education and employment, along with significant advances in science and technology that made higher levels of competence in academic and professional English much more important. One of the most noticeable changes in education during this century was the founding of hundreds of new colleges and universities in English-speaking countries, with educational programs and research labs to promote the advancement of science and engineering. These new programs required that faculty members not only understand their fields more broadly and deeply, but also made it necessary for them to teach it, research it, and write about it in English at higher levels of professional sophistication. Some of the universities with science and engineering programs that were established in the 1800s were the University of Manchester in England (1824), University of Toronto in Canada (1827), University of Melbourne in Australia (1853), Massachusetts Institute of Technology in the United States (1865), and the University of Auckland in New Zealand (1883). There were also hundreds of others. At these schools, English education for technical studies and employment became more firmly embedded in the formal instruction provided by professors in the science and engineering departments, with gradually increasing assistance coming from English department faculty who had enough interest in science and engineering, and familiarity with its linguistics, to be valuable to the students.

Another significant change in the 1800s that influenced EST was the establishment of many new professional societies, publications, and conferences for the advancement of science and technology. These included professional societies like the Institution of Civil

Engineers (1818) and the Chemical Society (1847), as well as the Association for the Promotion of Technical Education (1889) and the Society for the Promotion of Engineering Education (1893). Three examples of scholarly publications that began at this time are the *American Journal of Science* (1818), *Nature* (1869), and the *Physical Review* (1893). Publications in the technical journals and magazines of this era not only featured the discoveries and practices of science and technology, but also addressed the English of science and technology. Sir William Richard Gowers's article on "The art of writing in relation to medical and scientific work," published in the *British Medical Journal* in 1895 is one good example.

One additional and yet very significant change in the 1800s that increased the value of learning workplace English was the rapid expansion of technical and industrial jobs in English-speaking nations that employed large numbers of recent immigrants who did not speak English as their native language. This massive movement of work in the 19th century from agriculture to industry and from non-English-speaking nations to English-speaking ones greatly increased the demand for specialized English language training. Some of the resources that were developed at this time to help meet the needs of workers in technical occupations were dictionaries in Europe like *The Imperial Dictionary, English, Technological, and Scientific* (1859) by John Ogilvie, a lexicographer and mathematician. There were also popular newspapers with a technical focus such as the *Scientific American* (1845), which advertised itself as a family newspaper for workers in agricultural, manufacturing, and mechanical trades as well as for children and students who were preparing for these lines of work. Books by educators that were intended to promote reform in vocational language and training were also written at this time. One such book was *Systematic Technical Education for the English People* (1869) by John Scott Russell, whose background in engineering and education inspired strong passions for better education in technical fields.

In the 20th century, the number of articles and textbooks on English education for science and engineering continued to grow, as did the number of language professionals with greater interest in this new line of work. Much of the research, publication, and education that supported language learning in the early 1900s was still not called EST at that time, but prolific activity by content experts, linguists, and a growing new breed of technical writing specialists continued to expand English language awareness and training for technical and scientific work. Two of the most revolutionary discipline-specific textbooks on English in the first half of the century, according to technical writer and historian Robert Connors (1982), were *The Theory and Practice of Technical Writing* (Earle, 1911) and *English for Engineers* (Harbarger, 1923). These were written primarily for NS, but NNS used them in class as well, since both kinds of students were expected to attain the same level of professional competence.

It was after World War II, however, that English language education grew and matured the most. International partnerships in rebuilding war-torn governments, economies, and infrastructure, as well as the development of increasingly cheaper means for global transportation and communication, brought English to the forefront as the world's most important language for international communication and cooperation. The rapid postwar growth and internationalization of universities in the United States and other English-speaking countries also increased the value of learning English for academic purposes. With English now as the preferred global language for international work and studies, this greatly increased the demand for more sophisticated discipline-specific English education to satisfy the vast majority of non-native English-speaking scientists and engineers in the world who needed English for work and professional development. This heightened demand for discipline-specific English training consequently generated enough professional attention in the growing field of applied linguistics for the work to be now officially labeled "English for science and technology" by the specialists who taught it. Some of the most influential people in the development of EST as the name for this specialization within the

field of ESP were Larry Selinker, John Lackstrom, and Louis Trimble at the University of Washington in Seattle. Their work, begun in 1967, spawned several papers and presentations, along with enough experience to eventually generate one of EST's most influential books, *English for Science and Technology: A Discourse Approach* (Trimble, 1985). Other applied linguists also began to engage in EST in the 1970s and 1980s, publishing papers about their work and their research in general language education journals like *TESOL Quarterly* (established in 1967), and later in the *ESP Journal* (established in 1980), which later became *English for Specific Purposes: An International Research Journal*. In parallel to the establishment of EST as a bona fide profession, which now principally addressed the needs of NNS, another field called "technical communication" developed to focus on meeting the technical English training needs of NS. This gravitation to two different professions—EST for NNS and technical communication for NS—still exists today in the 21st century; however, the lines between the two specializations have begun to blur into what some call "professional communication," for lack of a better term. For the most part, however, applied linguists who support the English language training needs of NNS in science and engineering still call themselves EST specialists, no matter what level of EST (the language) they teach.

EST Research

EST research is normally conducted to meet the information needs of two different audiences: EST educators and EST learners. Research carried out for EST educators is similar to the research in other specializations within English for specific purposes; it seeks to identify specific tasks that a specific group of learners need to perform in academic or workplace contexts, and then assesses what kind of instruction will best fill the gap between the learners' present skills and the skills that are required to complete those tasks successfully. Principally, this research involves identifying and describing the spoken scripts and written genres in English that facilitate these tasks, but at deeper levels the research also investigates how this English can be used more effectively in context to obtain the most satisfactory results. Additionally, the research must also uncover the most appropriate mental perspectives, amounts of content knowledge, attitudes, body language, emotions, tones of voice and other relevant features that can enable this English to accomplish its goals. Some of the necessary information for this research can be gathered from surveys and interviews of the target learners in order to understand their objectives, skills, and preferences. Other information can be gathered from stakeholders, such as employers, clients, customers, and co-workers to understand their expectations. And further information can be gathered from the research findings published by others. The results of this EST research are normally used to help educators make decisions about how best to meet the needs of their own specific set of learners. But if the findings are significant or the instructional approach is especially impressive, the material can also be published to help other educators working in similar contexts. EST research designed for EST educators is usually published in books or periodicals read by applied linguists.

EST research carried out for EST learners is similar to that carried out for EST educators, except this kind of research is normally designed to help graduate students or working professionals at much higher levels who are interested in substantial research-based advice to help them develop their professional communication skills further. The emphasis of this work is much less on English for academic purposes as it is on English for professional purposes, and is usually sophisticated enough to speak to the information needs of both NS and NNS alike. Research of this variety is normally published in books or periodicals read by scientists, engineers, and language researchers working at the higher ends of EST—like the journal *Transactions on Professional Communication*, published by the Institute of

Electrical and Electronics Engineers—and may be authored by EST researchers, technical communication researchers, or researchers in other areas, including experienced professionals in science and engineering themselves. EST research for higher-level learners is clearly the most challenging, and yet this deeper understanding of communication designed to educate working scientists and engineers is also vital for improving EST instruction at the beginning levels since this higher-level research can explain successful discipline specific language use in much greater detail as well as shed more light on where EST learners ought to be heading in their English language acquisition.

EST Training

EST training comes in many different forms and sizes since it is specifically tailored to fit the unique situation of each learner. At the smallest end, EST training may consist of a workshop or seminar at an engineering conference to help engineers give better conference presentations, one-to-one writing assistance to help scientists improve their English on returned journal article manuscripts, English instruction embedded in a university software course to help students write better software documentation, or a special training course to help NNS graduate student teaching assistants prepare to teach NS undergraduates in introductory science or engineering courses. At the opposite end, EST training may consist of entire courses or curriculums within science and engineering departments to meet the discipline-specific English training needs of all the students, or it may consist of in-house programs within major companies that are responsible for providing EST training and document production for all aspects of corporate communication. EST training can be highly personal (e.g., face-to-face) or highly technical (e.g., online independent study). What is most important, however, is its suitability for the specific instructional content, learning objectives, and learning context. Sophistication in technologies, classroom facilities, or instructional resources mean very little in EST if the learners cannot successfully carry out the target tasks in English at the end of their training that the EST instruction was designed to train them for.

EST Teachers

EST teaching is a highly challenging profession that requires significant time, commitment, and expertise. It also requires a wider range of knowledge beyond English linguistics and language education. Those who obtain the most impressive results from their teaching tend to have the following characteristics:

- a good understanding of languages;
- a strong understanding of English linguistics;
- a strong understanding of human nature and communication;
- a strong understanding of teaching, learning, and assessment;
- a good understanding of science, engineering, and related fields such as math and business;
- a strong understanding of English use in science, engineering, and related fields;
- a strong understanding of EST education and research;
- a very strong interest in helping people—the most essential requirement for successful EST.

Teachers who excel in EST also tend to be committed to EST as their life work and continually seek to develop themselves professionally.

EST in the Future

EST technically began when the very first non-native speaker of English sought assistance with learning the English required for work or study in science or engineering, and EST will continue as long as the need for English training in technical fields remains. Presently, the demand for EST teachers exceeds the supply of available candidates, and thus the field remains rich in employment opportunities for this very important work.

English in Asian and European Higher Education

SARAN KAUR GILL AND ANDY KIRKPATRICK

The internationalization of higher education has led to a noticeable increase in the number of courses and degrees taught through the medium of English. One of the main reasons is the fact that higher education is a lucrative industry. As a result, there is a need to internationalize curricula as part of the strategy to attract students from different parts of the world to universities in varying locations of the globe. Another reason is that nations want to be active players in the knowledge economy and thus there is the need to be able to access and contribute to the latest advances in the field of science and technology. All of these align with the need to attract international students and staff and to publish and be cited internationally, both important criteria of the Shanghai Jiaotong and the Times Higher ranking schemes for universities.

In a study commissioned by the Academic Cooperation Association (ACA), Wachter and Maiworm (2008) investigated the number of English-taught programs in European higher education for the year 2007. They discovered that some 2,400 degrees were now taught in English in continental Europe, with the major move towards English-taught programs being in the Netherlands and Northern Europe, although there was also evidence of a significant shift towards English-taught programs in Spain. They identified 774 English-medium degree programs in the Netherlands, 415 in Germany, 235 in Finland, and 123 in Sweden. Phillipson (2009) questions the Swedish figure, saying the data from the Swedish National Agency of Higher Education shows that as many as 480 out of a total of 680 MA degrees are taught in English.

Wachter and Maiworm's findings for 2007 contrasts with those of their earlier 2002 study which reported that English-medium tuition in continental Europe was still a relatively marginal phenomenon with only 700 English-medium degree programs (Maiworm & Wachter, 2002). This sudden and rapid increase of English in higher education has led Coleman to argue that "it seems inevitable that English, in some form, will definitely become the language of higher education" (Coleman, 2006, p. 11). Nevertheless, Wachter and Maiworm hold a more sanguine view, pointing out that "despite the steady growth, in no country are English taught programmes anywhere near challenging the survival of the domestic language" (Wachter & Maiworm, 2008, p. 91).

This increase in English-medium programs has been mirrored by the increase in scholarly publications in English. For example, Hamel reports that even the journal of the *Association Internationale de Linguistique Appliquée* (and note the French title of the organization) has, since 2003, become an English-only publication. He states that "the present pre-eminence of English language use in scientific publications has already severely reduced multilingualism in the field, and may eliminate the status of any other language as an international language of science" (Hamel, 2007, p. 66).

In the European context, this relatively sudden and rapid shift to English-medium programs is one consequence of the Bologna Process, named after the Bologna Declaration signed on June 19, 1999 in Bologna. The main aim of the Bologna Process is to create a European higher education area (EHEA) which will facilitate academic cooperation and

staff and student exchange within Europe. To date 46 countries have signed up (Bologna Process, 2010). The adoption of English as the common language to facilitate academic cooperation and exchange has led to the argument that “what emerges unambiguously is that in the Bologna Process, internationalization means English-medium higher education” (Phillipson, 2009, p. 37).

In order to attract international students, many countries in Asia have opened their doors to a model of transnational education with collaborative links with foreign institutions of higher learning, a move that itself necessitates a change in language policy from national languages to English.

Malaysia was one the earliest Asian countries to develop transnational private higher education opportunities for its citizens and to also develop the nation as a regional hub of education (Gill, 2004, p. 140). Malaysia provided higher education opportunities in English as far back as the 1980s. This was when Malaysian educational entrepreneurs responded to a sudden local need for cheaper international degrees by developing a system whereby students did two years at a Malaysian private college and then through “credit transfer” could enter the third year of US universities. Based on this model, they then went on to initiate “twinning programs” (“1 + 2” and “2 + 1”) with British and Australian universities in the late 1980s.

As a consequence, Malaysia has come to have some 100 private colleges and private university-colleges, which have partnership programs with universities in Australia, Great Britain, the United States, and other English-speaking countries.

In addition, there are now a total of more than a dozen private universities established after 1997–8 when the economic crisis set in. These include engineering universities set up by the three public utility corporations in Malaysia, Telekom (the national telecommunications company), Tenaga Nasional (the national electricity board), and Petronas (the national petroleum company) to branch campuses of foreign universities, as mentioned below (Gill, 2004, p. 141).

Presently, in the Asian region, private higher education has become a significant money making venture—all of this contributes to global academic capitalism. As a result, there is tremendous interest from British, American, and Australian universities to export their education to Asia. This has contributed to the growth of English-medium universities in Asia. Examples include Nottingham University which has campuses in Ningbo, China and in Malaysia. Chapman University from the United States of America has a campus in Singapore as has the University of Newcastle, UK, which has set up a medical campus in Malaysia. Leeds Metropolitan University has a campus in Bhopal, India and the University of Liverpool has a campus in China, and Monash University has a campus in South Africa and Malaysia.

These Asian countries and universities are trying to establish themselves as education hubs and attract international students from the region. Not only does this bring the university income and prestige, it can also be attractive to regional students as fees and living expenses are appreciably lower than those in countries such as the United Kingdom, the United States of America, and Australia, where many international students currently study.

In China, as the country prepares to participate fully in the World Trade Organization (WTO), universities and colleges have been instructed to use English as the main teaching medium for selected professional subjects, including information technology, biotechnology, new-material technology, finance, foreign trade, economics, and law. This change was affirmed in a circular from the Education Ministry in China, which said that 5% to 10% of universities’ total courses must be taught in a bilingual manner in 3 years’ time. These instructions came after Premier Zhu Rongji made the following statement in June 2001 at one of the premier business schools in China (the Qinghua University Economics and

Management School): "I hope all the classes will be taught in English. I don't worship foreign languages, but we need to exchange our ideas with the rest of the world" (*South China Morning Post*, 2001).

Even Indonesia, the country that was a role model for Malaysia in its own language planning stages, is pragmatically relaxing its control over mother-tongue medium of instruction in favor of English, in order to attract international students. This is reflected by an advertisement for a medical degree from Padjadjaran University as a program that is conducted fully in the English language (*The Malay Mail*, August 14, 2001).

In Japan, Waseda University is one of the universities nominated by the Japanese Ministry for Education, Culture, Sports, Science, and Technology to participate in the Global 30 Project for establishing core universities for globalization (<http://www.waseda.jp/eng/news09/100215e.html>). This has led the university to offer a total of nine undergraduate and postgraduate degree courses in English in politics, economics, science, and engineering, beginning in September 2010.

The rise in the number of Asian universities offering degree courses through English has been seen as a threat to the privileged position occupied by prestigious universities in the United States and the United Kingdom (Kirkpatrick, 2009). In a report compiled in 2009 for the British prime minister, Gordon Brown (UK/US Study Group, 2009), leaders of several American and British universities call for the establishment of an "Atlantic Trust" by which American and British universities will partner universities from other parts of the world, ostensibly to foster the "development of a global civil society which will bind universities and countries together through common values and principles." Yet this is framed as part of a challenge of "extending the UK/US model to third locations" (2009, p. 3) and the language through which this will be achieved is English.

Despite the increase in English-medium programs, the national languages in respective Asian and European countries are not forgotten (although other languages often are). Apart from Singapore, which made the decision to use English as their main medium of instruction in the entire educational system including universities, many other nations in Asia have adopted a bilingual system of education. This is to ensure that there is a balance between national and international needs and challenges manifest through linguistic educational policies. A clear case is demonstrated by public universities in Malaysia that use English for courses of science and technology and Bahasa Melayu for social science and humanities. Yet how precisely to introduce this limited notion of bilingual education (the national language + English) remains the subject of controversy and experimentation. One principle being tried is that of "parallel languages" (Preisler, 2009), but this has yet to be defined. At one extreme it means that all subjects should be taught in the national language and English. At the other extreme, universities may simply offer courses in English as they so wish. Preisler suggests, however, that the notion of "complementary" languages needs to be introduced where "the two languages will be functionally distributed within the individual programme according to the nature of its components, that is, the national or international scope of their academic content and orientation of their students" (Preisler, 2009, p. 26).

At the Hong Kong Institute of Education students take degrees in Cantonese, Putonghua, or English, and many degrees have some modules taught in Cantonese and others in English. However, the situation at the other seven government universities in Hong Kong demonstrates how slow institutions have been to embrace the notion of complementarity as all, with the exception of the Chinese University of Hong Kong, are English-medium only universities. This is despite the government's policy of creating a citizenry that is trilingual in Cantonese, Putonghua, and English and biliterate in Chinese and English. Thus the overwhelming majority of higher education degrees and programs in a Chinese city with a population of more than 7 million are taught (officially, in any event) only

through English. In other words, complementarity is not the norm for higher education in Hong Kong—English-medium only is.

In forecasting global demand for international higher education, Bohm, Davis, and Pearce (2002, cited in Ng, 2009) found that by 2025, Asia will represent some 70% of total global demand and an increase of 27% from 2000. Within Asia, China and India will represent the key growth drivers, generating over half of the global demand in international higher education by 2025 because of their booming economies.

English in Higher Education in the Postcolonial World

ANDY KIRKPATRICK

The internationalization of higher education has seen an exponential increase in the use of English in higher education throughout the world, both as a medium of instruction and assessment, and as the language of scholarship. For example, more than 40 countries have signed up to the Bologna process, the aim of which is to create a European Higher Education Area (EHEA) in which staff and student mobility and academic cooperation of various forms will be facilitated. This has led to the adoption of English as the principal medium of instruction. "What emerges unambiguously is that, in the Bologna process, internationalization means English-medium higher education" (Phillipson, 2009, p. 37). This trend toward English-medium higher education can also be seen throughout the postcolonial world, including many countries where the language of the colonizers was not English.

The internationalization of higher education has, until recently, been primarily characterized by the movement of students from postcolonial and other societies to receive an education in the West, with the US, the UK, and Australia being the major "receiving" countries. As these international students pay fees, their importance as a source of income for Western universities should not be underestimated, especially as there are some 2 million such students (Howe, 2009). At the same time, the movement of these students overseas deprives their home countries of much needed capital. As many international students decide or are invited to remain overseas, it also deprives their home countries of talent. Not surprisingly, therefore, many of the "sending" countries have themselves established local education hubs in order to attract fee-paying students and to discourage their own students from traveling overseas. As this almost always requires courses to be taught in English, former British and American colonies where English has become institutionalized and where it remains a medium of instruction in higher education are at an advantage.

Malaysia provides an interesting example. During the 1980s, the government adopted a policy of Malaysianization. This included a move to the use of the local language, Malay, as the medium of instruction at the university level. One result was to create a flood of students of Malaysian nationality, but who were not ethnically Malay, to study overseas. Australian universities did particularly well from this development. More recently, Malaysia has reversed this policy and has positioned itself as an education hub (Gill, 2004). Currently, there are more than 100 colleges which have some form of partnership with overseas universities. Some Western universities have established campuses in Malaysia itself. More significantly, Malaysia has allowed the setting up of its own private universities, of which there are now 12. One such is the Petronas University of Technology, established in 1997 by the national oil company. This offers English-medium courses in science and engineering, and the university's journal, *Platform*, is English-medium. Another example is the English-medium Tunku Abdul Rahman University, which offers a wide range of courses to fee-paying students.

A postcolonial setting where English-medium university education is heavily entrenched is Hong Kong. Six of the eight government-funded universities are English-medium. Only the Chinese University of Hong Kong is officially bilingual and only the Institute

of Education is officially trilingual (Cantonese, Putonghua, and English). The language policies of the six English-medium universities undermine the Hong Kong government's policy of creating citizens who are trilingual in Cantonese, Putonghua, and English and biliterate in Chinese and English, as this creates a wash-back effect into secondary schools. Parents demand English-medium secondary education for their children in order to prepare them for university education. Those who can afford it send their children to private English-medium schools, a development that can be seen throughout the world: "To actually forsake the public school system that teaches in your own language for the private one that teaches in English is an increasingly common phenomenon" (Wang, 2007, p. xiv).

Hong Kong, therefore, provides an example of where the desire to set up an education hub—and so teach through English—clashes with the official language policy. Further examples are easy to find. In the Philippines, the move to modernize the national language, Filipino, and make it a language of higher education has been derailed by the prestigious universities offering only English-medium higher education (Gonzalez, 2007).

It is not only countries that have a history of "English" colonialism that are setting up English-medium higher education courses. Despite Malaysia's efforts to keep local students in Malaysia, some are choosing to go to Russia to obtain a medical degree. These degree courses are offered in English at a number of Russian universities, including Moscow Medical Academy, and cost about a quarter of the fees of equivalent degrees in Australia and Britain.

China's University and College Admission System (CUCAS; www.cucas.edu.cn) provides a list of Chinese universities which offer English-medium degrees. These include 40 universities which offer "Western" medical degrees. Many also offer some form of business degree through English. This is in response to remarks made by the then Chinese premier, Zhu Rongji, when he visited Tsinghua University's School of Economics and Management: "I hope all classes will be taught in English. I don't worship foreign languages, but we need to exchange our ideas with the rest of the world" (China varsities to teach in English, 2001).

The trend to English-medium higher education and the setting up of regional education hubs to attract foreign fee-paying students has occasioned criticism from those who argue that international education should be multilateral and multilingual: "We should move beyond the so-called established order dominated by Anglo-Saxon paradigms and develop systems and standards that could preserve national heritage and promote rich cultural traditions" (Mok, 2007, p. 447).

In effect, however, the courses offered in English suggest that financial gain for the course provider is often the major motivation for such courses. In the context of East Africa, "the challenge is to establish forms of knowledge that are responsive to the development needs of Africa" (Ogachi, 2009, p. 343). However, instead of providing courses that might be useful for Africa's development, many international universities offer a raft of courses in marketable subjects such as business administration. Examples include the Indira Gandhi Open University (IGOU), which has a recruitment office in Nairobi, Kenya. IGOU offers courses in business, education, commerce, and public administration, but not in science and technology. "Internationalization of higher education in the region has not embraced science and technology oriented academic programs" (Ogachi, 2009, p. 345).

Africa is trying to create regional collaboration in higher education. For example, the Southern African Development Community (SADC) protocol on Education and Training has set equal university fees for all citizens from the SADC region (Jowi, 2009). The East African community is working on a similar protocol. However, many Kenyan students currently study in Uganda because the fees there are lower. They also appear to be happy to enroll in less prestigious universities: more than 50 percent of the students enrolled at Uganda's Kampala International University (KIU) are foreign, mostly from other parts of

East Africa (6,715 out of 13,938). Yet KIU is not even ranked among the top 500 African universities. Education is Uganda's fourth largest foreign exchange earner (Ogachi, 2009, p. 338). Not surprisingly, the medium of instruction is English.

Countries that were French colonies and where French became institutionalized in the same way that English did in the postcolonial era are also rapidly moving to the use of English in higher education. Clayton (2006) records a telling account of this in Cambodia at the then named Institut de Technologie du Cambodge. In 1993, the students protested against the medium of instruction being French and called for it to be changed to English. As AUP ELF, the French francophone agency, was funding the institute, they insisted on retaining French as the medium of instruction. In the end, extra support for and classes in English were also provided. Later, more than 80 percent of students at the Royal Phnom Penh University chose English as their first foreign language. According to one Ministry official, "teaching French instead of English is in fact an indirect punishment for students because it so clearly limits their opportunities" (Clayton, 2006, p. 222).

A similar trend toward English and away from French can be discerned in previously francophone Vietnam:

When Vietnam embarked on economic reforms in 1986 . . . it promoted a nationwide rush to learn English . . . English classes were crammed with not just students but also professionals such as doctors and engineers as well as retired government officials, senior police, army officers and diplomats. (cited in Ho & Wong, 2004, p. 1)

As mentioned earlier, English has also become the international language of scholarship. It is "by far the most important language of scientific and scholarly conferences" (Ammon, 1996, p. 26). Ninety percent or more of the information in the Science Citation Index "is extracted from journals in English taken mostly from English language journals" (Truchot, 2002, p. 10). Universities in the postcolonial world (and indeed elsewhere) are placing increasing pressure on their academics to publish in English. Chinese academics earn more for publishing in English than for publishing in Chinese-language journals. This is threatening publication in local languages as the move toward English "has already reduced multilingualism in the field and may eliminate the status of any other language as an international language of science" (Hamel, 2007, p. 66).

This move toward publication in English—and therefore the dissemination of knowledge through English—may also be threatening the status of knowledge written in languages other than English: "African academic discourse has been dominated by the use of English, French and Portuguese, with English the most dominant" (Jowi, 2009, p. 269). It is only in rare instances—Ethiopia is a case in point—where the national language is also the language of scholarship. Even in Hong Kong, a Chinese city of more than 7 million people, English remains the major language of scholarship despite the increasing power and influence of China itself.

The dissemination of "local" knowledge through English may also essentially alter the nature of the knowledge being disseminated (Kirkpatrick, 2009). Not only are problems of translation legion, but the need to adopt Western scientific paradigms can radically affect the knowledge. An example is traditional Chinese medicine where the fundamental concept *qi* has been variously translated as: "that which makes things happen in stuff"; "stuff in which things happen"; "energetic configuration"; "a configuration of energy"; "(finest matter) influences"; "emanations"; "vapours" (Scheid, 2002, p. 48). At the same time, the diversity of practice and ambiguity characteristic of traditional Chinese medicine (Hsu, 1999) has been replaced by the need for a "unified and homogenous knowledge" (Scheid, 2001, p. 270). The tension between the traditional diversity of practice and the modern need for a unified knowledge is captured in the editorial notes of the *Australian*

Journal of Acupuncture and Chinese Medicine: “The AJACM acknowledges the diversity of Chinese medicine theories and practice, and encourages the integration of research, practice and education. It promotes the use of rigorous and appropriate research methodologies in the field of Chinese medicine . . .” In practice, it may not be easy to marry a diversity of theories and practice with rigorous and appropriate research methodologies.

It is clear that the internationalization of higher education has seen an increase in the use of English as a medium of instruction and assessment, along with an increase in the use of English as the language of international scholarship. While the adoption of a single language facilitates international exchange and collaboration in higher education, it also threatens the role of other languages in higher education. This threat has been recognized in Europe, especially in the Nordic countries, where language policies are in place which are designed to revitalize the national languages as languages of scholarship and higher education. Thus, in their study which showed a significant growth of the number of English-medium programs being offered by European universities between 2002 and 2008, Wächter and Maiworm concluded that “Despite the steady growth, in no country are English taught programmes anywhere near challenging the survival of the domestic language” (2008, p. 91).

It is more difficult to take this sanguine approach in many postcolonial settings where “it seems inevitable that English, in some form, will definitely become the language of higher education” (Coleman, 2006, p. 11). While some universities in India have switched to Hindi and regional languages, English remains the most common medium of instruction. African languages play a minor role in higher education, especially in sub-Saharan Africa. In the postcolonial societies of Asia, many universities offer only English-medium education. And even in societies which have never been colonized or were once colonies of other European powers, the number of English-medium courses is increasing. This not only undermines the role of local languages in higher education but also creates a unilateral exchange of knowledge. The commodification of education and the fact that the “North” dictates imitative modernization in developing countries (Altbach & Knight, 2007) mean that “there is currently an uneven balance of knowledge exchange” (Jowi, 2009, p. 274). This uneven knowledge exchange is conducted almost entirely through English. The domination of English creates advantages for those countries that use English as a medium of instruction and research, but often this is at the expense of the development of their own national languages as languages of education and scholarship. This means that the internationalization of education, far from bringing equality and equal opportunity, may “deepen the relations of dependency of local higher education institutions on higher education institutions in industrialized countries” (Jowi, 2009, p. 333).

It would be timely, then, for universities in postcolonial settings to develop and implement bilingual policies, possibly taking their lead from the examples set by the Nordic countries. These might include a system of complementary languages by which “the two languages are functionally distributed within the individual program according to the nature of its components” (Preisler, 2009, p. 26). This would require, for example, the six government-funded universities in Hong Kong which currently offer only English-medium courses having to adopt English–Chinese bilingual policies.

These bilingual policies should extend to the language of scholarship. International education needs to be multilateral and multilingual (Mok, 2007; Kirkpatrick, 2011). One way of maintaining or revitalizing the use of local languages as languages of scholarship is to develop bilingual journals. These used to be common, but, largely for cost reasons, have become rare. Despite its French title and the nature of the subject, even the *Association Internationale de Linguistique Appliquée* has published articles only in English since 2003 (Hamel, 2007). With the ever-increasing use of English in higher education, it is perhaps time that such bilingual journals were re-established.

English in the Nigerian Novel

EDMUND BAMIRO

The Nigerian English novel (NEN) represents creative writing by English-speaking Nigerian bilinguals who use English to re-create typical Nigerian sociolinguistic, cultural, and emotional contexts. Like other postcolonial English novels, NEN is defined by two linguistic imperatives: heteroglossia and nativization. The term heteroglossia was coined by Mikhail Bakhtin to indicate “the multiplicity of actual ‘languages’ which are at any time spoken by the speakers of any ‘language’” (Dentith, 1995, p. 35). Consequently, “the novel is the form which not only takes advantage of heteroglossia but, when it is most authentically itself, is the form which exploits, celebrates, and revels in the multiplicity of language” (p. 38). Nativization refers to “the linguistic readjustment a language undergoes when it is used by members of another speech community in distinctive socio-cultural contexts and language contact situations” (Kachru, 1992, p. 235).

NEN provides abundant examples of how the varieties of English used in the Nigerian context diverge from British or American norms. Three main varieties of English have been identified in Nigeria and in other ESL situations: the lower variety (basilect), which is the “context” variety associated with the illiterate and semiliterate population; the intermediate variety (mesolect), which is the intranationally accepted variety; and the higher variety (acrolect), which is the internationally intelligible variety (Bamiro, 1991a, pp. 7–8).

The basilect manifests in NEN in the use of Nigerian Pidgin English and other non-standard forms by people in the lower social stratum. As a communicative strategy, the basilect is often employed in NEN to characterize the status of interlocutors, to reveal social classes, and to provide local color (Bamiro, 1991b). In the following example from Ekwensi’s *Jagua Nana* (1961), the female protagonist uses pidgin to attack male chauvinism in Nigeria; the standard English equivalent follows in brackets.

All de young men in Lagos dem talk sweet sweet—like you doing now, Freddie. But when dem get a gal on de bed, you never see dem again. And if dem give de gal belly, she mu’ carry de belly alone, and dem will run and lef’ her. Is very bad of de young men. (p. 19)

[All the young men in Lagos are glib talkers—just like you are talking now, Freddie. But once they have succeeded in making love to a girl, you never see them again. And if they make a girl pregnant, she alone will be responsible for the pregnancy as the young men will abandon her.]

The mesolect represents language use mostly associated with Nigerian English. In addition to being used at the highest level of government and administration in Nigeria, the averagely educated Nigerian speaks the mesolectal variety and it serves as the communicative norm. Mesolectal forms in NEN are especially found at the levels of lexico-semantics, syntax, and pragmatics. For example, basing his analysis on the novels of Ike, Omotoso, and Alkali, Bamiro (1994) illustrates 10 lexico-semantic categories in NEN. The significant category of translation equivalents is itself a bundle of contextually dependent features related to figurative language, proverbs, modes of reference, loan translations, prayers, invectives, ritual communication, panegyrics, idiomatic expressions, and kinship terms.

2 ENGLISH IN THE NIGERIAN NOVEL

For instance, kinship terms such as *mother*, *father*, *brother*, *sister*, *cousin*, and *wife*, as used in NEN, are characterized by a more extended meaning than what obtains in British or American English.

Also, by reference to the novels of Achebe, Okara, Ekwensi, Aluko, Alkali, and Omotoso, Bamiro (1995) highlights several syntactic forms that differentiate NEN from the traditional linguistic canons of English literature. Prominent among these are focus constructions which underlie the logic of many Nigerian languages. For instance, the reduplicated item *well-well* in "Some of us can take competition *well-well*" (Omotoso, *Memories of Our Recent Boom*, p. 141), translates in Yoruba as *gidi-gidi*.

As documented in NEN, the acrolect not only signifies the elusive linguistic target which most Nigerians never acquire, but also represents hypercorrection toward the norms and code of the native speaker of British or American English. Winford defines hypercorrection as "the attempt by linguistically insecure speakers to replace features of their everyday speech by forms which are regarded as prestigious" (1978, p. 282). Consequently, in most contexts the acrolect is used to satirize Nigerians who feign the English native speaker's linguistic behavior. In the following example from Oyegoke's *Broken Ladders*, a high school student uses the acrolect to affect learnedness:

I was thrown into a state of temporary apoplexy, asphyxia, and physical coma when I read your last missive. A sledge-hammer punch from the great Mohammed Ali on the massive jaws of George Foreman couldn't have been more devastating! I read your letter and was colossally dazed to hear that your yes on that momentous day was a little less than a yes. (p. 39)

The hypercorrection derives from uncommon vocabulary and allusion to American celebrities like Ali and Foreman.

On the whole, English in NEN shows that although the basilectal and mesolectal varieties may be nonstandard in formal terms, they nevertheless make a very strong case for regarding English as a language with multiple cultural identities and traditions. Consequently, these features of NEN are systematic and predictable, giving it a linguistic status quite distinct from the dominant code of standard English. English in the Nigerian novel can then be construed as a dialect made up of its own rules, which function regularly to promote communication amongst various narrators and characters in the texts.

English(es) and Academic Publishing

ULRICH AMMON

It is common knowledge that English is the global language of science, in written as well as oral communication, also used extensively by non-Anglophones (Ammon, 2001; Carli & Calaresu, 2003). Preference for English is more pronounced in natural than in social science, and least in the humanities (Ammon, 1998, pp. 137–79). Figure 1 illustrates the proportions of major languages in natural and social science publications, though the databases may be somewhat biased in one direction or the other. The diagrams suggest a greater degree of hegemony of English for the natural than the social sciences, though the visual comparison is impaired by the logarithmic ordinate for the social sciences which is meant to facilitate comparison between languages. For the natural sciences such comparison is of hardly any interest, since shares of publications are generally very low. For the humanities there are no globally representative databases available, but numerous bits and pieces of information strongly suggest that national languages still play a greater role there, due to topics as well as to text style, traditions, and terminology.

The upper part of Figure 1 also shows that French and German were of similar rank as languages of publication of the natural sciences early in the 20th century, which—as numerous anecdotal data indicate—was also true for the social sciences and the humanities, but has not been confirmed by comparably representative data. English was, however, better placed globally by colonialism and national economies even then, and its ascent was accelerated by World War I, Nazism, World War II, and the Soviet Union's fall by weakening competitor languages. The United States rose to become a global center of science, and the dominance of its language was enhanced by superior resources for research, development of bibliographic databases, citation indices, abolition of universities' foreign language requirements (forcing others to use English), and halo effects like the extension of academic prestige to the language (Ammon, 1998, pp. 179–204). Accordingly, American English is the preferred choice in most academic publications, especially again in the natural sciences, though British English is often accepted as equally adequate. Other varieties of the pluricentric language, especially those of postcolonial countries, are, however, largely excluded from the more prestigious scientific publications, not to speak of non-native forms.

To call English the “lingua franca” of science camouflages the actual language divide. English is not a lingua franca in the sense of being a non-native language for all its users like medieval Latin. It is an asymmetric global language, whose advantages are unequally distributed. It serves virtually everyone for global contacts and helps spread innovations and thus enhances scientific development. However, non-native speakers invest much more than native speakers (through learning) in creating the public good of a common language (Van Parijs, 2008), but still remain plagued by poorer skills, which often exclude them from publications and other participation in science. The native speakers dominate as gatekeepers to publishing and funding (Burrough-Boenisch, 2006; Flowerdew, 2008). There is also an Anglophone-centered flow of information and perception of scientific achievement (Durand, 2001), since non-Anglophones read publications in English while Anglophones hardly read any in other languages. Their linguistic advantage carries over to their countries' competitive advantage in science and scientific publication and the pull of their universities.

Anglophones tend to object that they, in turn, are deprived of the multitude of views which multilingualism entails. Nobody, however, prevents them from acquiring foreign language skills. Passive skills would, in fact, do, while non-Anglophones have to acquire active skills in English. Anglophones, however, abstain from learning foreign languages. Their linguistic disadvantages, which they tend to claim, can at least be said to be their own choice, while for non-Anglophones, a lack of skills in English often means foreclosure of an academic career. Weighting overall advantages and disadvantages of both sides remains, however, a challenging research task.

Communicative difficulties arise from any non-Anglophone background, especially from different text conventions (Clyne, 1987). Terminology can be a considerable problem especially in the social sciences and the humanities, where English is sometimes more and sometimes less detailed than other languages. Thus, to pick just two examples from sociology, English *social class* corresponds to the German *soziale Klasse* (antagonistic, Marxist tradition) or *Sozialschicht* (non-antagonistic) and *identity* to the Japanese 主体性 *shutaisei*, 独自性 *dokujisei*, or 自己認識 *jiko-ninshiki* with different shades of meaning. Thus, concern based on the hypothesis of linguistic relativity seems valid for social science and the humanities, since cultural differences are encapsulated in languages' semantic structures.

It would, however, also imply that non-Anglophones who avail themselves of the semantic resources of at least two languages have a cognitive advantage, though this certainly would not fully compensate for their communicative handicaps. In these veins, a single language of science would not only enhance scientific progress (through wider communication), but also hamper it by ignoring other languages' cognitive potential. Such assumptions, however, need corroboration. To the overall development of science, a global language still seems to be more conducive than restrictive.

Such conduciveness would be enhanced by reducing linguistic barriers erected by English. While they exist for all non-native speakers, they are disproportionately high for two groups: (a) for those whose languages have only recently lost international standing (French, German) or who have newly become involved in global communication (e.g., Russians) and who therefore have not adjusted to the recent situation; and (b) for those with a language of great structural distance from English and ensuing learning difficulties (e.g., Chinese, Japanese, Koreans). While the problems of the former will abate, those of the latter persist.

Research into problems and practical help could be stimulated by awareness campaigns (like La Madeleine, 2007; Carli & Ammon, 2008). Scientific organizations should deal with the problems and develop proposals for amelioration. There is need for more training in writing scientific texts in English during study (Swales & Feak, 2000) and for more editorial support for publishing (Burrough-Boenisch, 2006; Flowerdew, 2008), ideally with professional as well as linguistic aids (Benfield & Feak, 2006), which could be financially supported by publishers. In the long run, automatic translation may bridge the language divide, or skills in English may become so ubiquitous that Anglophones lose their advantages. Finally, non-native speakers, forming a vast majority, may gain normative control, as adumbrated by "International English" (Seidlhofer, 2003), or even transform English into a new, though closely related language, which could be renamed to suggest neutrality to something like "Globalish." It would have to be a multicentric language with traces from numerous linguistic backgrounds whose varieties would, however, be similarly mutually intelligible as those of today's English (see Ammon, 2006, pp. 25–7).

English-Language Learners and Subject Area Tests

RONALD W. SOLÓRZANO

Introduction

Students whose first language is not English bring a different set of language skills and background knowledge that is seldom recognized or utilized in English-medium classroom instruction nor used in assessments of their learning or knowledge (e.g., National Research Council, 1999; Gandara & Contreras, 2009). In fact, their native language is typically seen as a barrier to their subsequent success in all-English classrooms. Complicating this matter is the use of tests—either English proficiency tests or subject area tests—to determine when students are “ready” for all-English instruction and testing as well as to determine what in fact they do know. In the latter case, their true subject area knowledge may not be reflected in their test scores because of their limited English language. The fact that test scores on subject area tests do not have the intended meaning for this population of test takers is a fundamental problem for the validity of test interpretations and uses. Consequently, researchers have devoted much energy to better understanding (a) general issues with testing English language learners, (b) subject area tests and ELLs, and (c) opportunity to learn.

General Issues With Testing English-Language Learners

Among the most prominent issues with a potentially negative impact on ELLs are improper test development and use and varying definitions of English language proficiency and “academic English” (National Research Council, 1999; Solórzano, 2008).

Test Development and Use

While tests in general are becoming more prominent in the school accountability landscape, their importance for ELLs is rising also. Unfortunately, most tests are not designed or developed with ELLs in mind, yet these students are held to the same grade-level expectations as their native English-speaking peers. For example, most standardized tests used with ELLs are not “normed” using ELL populations and English language proficiency is assumed in subject area tests. Even though various achievement, standards-based, and language proficiency tests may be technically suspect for ELLs, they are used for multiple purposes including high-stakes decisions such as promotion, retention, program placement, and graduation. In some cases, districts use only one or two tests to satisfy these multiple purposes and this raises the “stakes,” so to speak, for ELLs.

The *Standards for Educational and Psychological Testing* (American Educational Research Association [AERA], American Psychological Association [APA], & National Council on Measurement in Education [NCME], 1999—hereafter referred to as the *Standards*) state:

It is important to consider language background in developing, selecting, and administering tests and in interpreting test performance . . . Test norms based on native speakers of

2 ENGLISH-LANGUAGE LEARNERS AND SUBJECT AREA TESTS

English either should not be used with individuals whose first language is not English or such individuals' test results should be interpreted as reflecting in part current level of English proficiency rather than ability, potential, aptitude or personality characteristics or symptomatology. (p. 91)

Challenges related to using one test for multiple purposes have been addressed by the psychometric community. For instance, the National Research Council (1999) reminds us that "each of these purposes can be achieved only if the test is valid for the particular purpose for which it is being used, and it is important to note that tests valid for one purpose may be invalid for others" (p. 20). This is a crucial point in that tests used to evaluate teacher or program effectiveness may not be designed to evaluate both simultaneously. This therefore calls into question decisions based on the results of these tests.

Indeed, the *Standards* (1999) remind us that:

For all test takers, any test that employs language is, in part, a measure of their language skills . . . Test use with individuals who have not sufficiently acquired the language of the test may introduce construct irrelevant components to the testing process. (p. 91)

Given the importance of language in test construction and subsequent test use and interpretation, language is an important consideration when it comes to developing, administering and interpreting tests—whether norm-referenced or criterion-referenced.

Varying Definitions of English Proficiency and Academic English

In order to determine adequate levels of English proficiency for the purposes of content area instruction and assessment, we need to define English proficiency. Government and educational agencies use various definitions of proficiency based on an assortment of English language proficiency tests, but controversy remains in this area (Rivera, Vincent, Hafner, & LaCelle-Peterson, 1997; Rumberger, 2000). For example, Pray (2005) argues that "defining language proficiency using discrete psychometric properties . . . fails to assess language used in naturally occurring contexts" (p. 389).

Haber (1985) reported on a disconnect while analyzing the link between one test used in schools in the United States, the language assessment scales (LAS), and content areas by concluding, "if the test [LAS] is to be used for a more fine-grain analysis of language proficiency or to predict future school achievement, then the test is inadequate . . . because of serious theoretical and methodological difficulties in test construction" (p. 809). On the other hand, other earlier tests defined and measured English proficiency differently. For example, Mahon (2006) reported that scores on the Woodcock-Munoz language survey (WMLS) related to the Colorado student assessment program (CSAP), a content area assessment. The WMLS purportedly reflected skills similar to those on the CSAP.

While earlier English proficiency tests were based on definitions of English proficiency reflecting discrete grammatical properties, post NCLB language assessments in the United States have become more closely aligned to state content standards as test developers tried to define "academic English" needed for classroom success. For example, as a result of enhanced assessment grants (Title III, NCLB Act) several English proficiency assessment projects were held to align English assessment to state content standards. Generally, these new assessments attempted to link English language proficiency to academic content standards. The English Language Development Assessment (ELDA) defined academic English as "(1) language used to convey curriculum-based, academic content, and (2) the language of the social environment of a school." The Comprehensive English Language

Learning Assessment (CELLA) defined academic English as the “body of knowledge, strategies and skills necessary for students to participate in school activities and learn from content instruction” (Rebarber et al., 2007, p. 65). And the ACCESS/WIDA “offers a continuum of expected performance of English-language learners as they progress through the language development process to acquire the English language skills necessary for reaching academic parity with their English proficient peers” (Bauman, Boals, Cranley, Gottlieb, & Kenyon, 2007, p. 82).

However, linking English language proficiency (ELP) assessments with ELP standards and academic content standards is not necessarily an easy task. Moreover, differentiating and assessing for “academic” and “conversational” language remains a challenge—even for this new generation of assessments. While acknowledging the superiority of the current assessments to past assessments, Abedi (2007) concludes, “there have been controversies over what is covered under the concept of academic English,” and he asks, “who decides how academic English proficiency should be captured within the ELP assessments? How should we evaluate the content and psychometric properties of ELP assessments that test academic English proficiency?” (p. 127). (Another question that could be added is “which content?” That is, who decides the content area/knowledge and disciplines from which children receive instruction and are tested? This topic, however, is beyond the scope of this entry.) This issue was recognized in California during a “linkage and alignment” evaluation of the statewide English proficiency test (California English Language Development Test—CELDT), the English Language Development (ELD) standards, and the statewide content standards conducted by Murphy, Bailey, and Butler (2006) on behalf of the California Department of Education. The authors report:

Considering the lack of correspondence in the complexity of the content area standards as compared to the ELD standards and the CELDT, it is apparent that scores on the CELDT do not reflect the range of achievement expected for all students (p. 57).

Kato, Albus, Liu, Guven, and Thurlow (2004) also found this potential disconnect between proficiency tests and content standards.

The different viewpoints on what constitutes academic English . . . makes the design, implementation, and interpretation of such a proficiency test complex at best, especially when translating back the results into what academic language skills a student truly needs for success across content classrooms such as reading and mathematics. (p. 1)

The authors compared results between the Test of Emerging Academic English (TEAE) and the Minnesota Comprehensive Assessment (MCA). In this case, the TEAE—designed “to gauge growth of emerging academic English language skills across all grades” did presumably represent those skills related to the MCA—especially at the lower grades (e.g., 3rd and 5th). This wasn’t necessarily the case at the upper grades (e.g., middle and high school).

How to align English proficiency tests closely to the skills and content reflected on subject matter tests remains unclear. More “linkage studies” are needed in this area to determine the predictive validity of ELP assessments relative to content standard tests. One thing is clear, as Fast, Ferrara, and Conrad (2004) remind us: “[ELP assessments] are not tests of academic content . . . no external or prior content-related knowledge is required to respond to test questions” (quoted in Abedi, 2007, p. 127). As a consequence, alignment to content standards may be elusive.

Subject Area (Content) Tests and English-Language Learners

Subject area or content-based tests test the subjects taught in schools (subject area and content area will be used interchangeably throughout). In many cases these subject areas are presented to teachers as content standards which drive the K-12 curriculum. The typical subject areas emphasized in schools (e.g., social sciences, math, English language arts, sciences) are tested at the end of the year. In many cases, these tests are used to determine adequate yearly progress (AYP), school quality/improvement, student promotion/retention, graduation, and potentially teacher salary. Because of the multiple uses of these tests, they are considered high stakes and are used for various purposes. For English-language learners these tests can be invalid because they introduce multiple language challenges to the testing process and may not align with classroom instruction.

Referencing the work of several in this field, Abedi (2002) reminds us that because “most standardized content-based tests (such as science and math tests) are administered in English and normed on native English-speaking test populations, they may inadvertently function as English language proficiency tests” (p. 232). He continues, “English language learners may be unfamiliar with the linguistically complex structure of test questions, may not recognize vocabulary terms, or may mistakenly interpret an item literally” (p. 232).

Complicating this issue is that the actual content areas tested contain additional language characteristics that further challenge ELLs’ academic success. Content areas have their own “language registers.” Furthermore, some disciplines may have a higher “language demand” than others. Echoing this sentiment, Abedi (2002) found in his analysis of four state and urban school districts from across the US that

The level of impact of language proficiency on assessment of ELL students was greater in content areas with a higher level of language demand . . . analyses show that ELL and non-ELL students had the greatest performance differences in reading, and the least performance differences in math, where language has less of an impact on the assessment. (p. 254)

He reports that “language factors may have a more profound impact on the [content area] assessment outcome than other background variables such as family income and parent education, particularly for ELL students” (p. 242). This finding is particularly significant to ELLs in that it highlights the importance of language (L1 and L2) and the quality of the instructional program rather than using familial or cultural deficit models to explain poor achievement (Solórzano & Solórzano, 1995).

Along these same lines, Roberson and Summerlin (2005) review the work of others and conclude that “the language of mathematics contains several types of vocabulary: ordinary terms, technical terms, symbolic expressions, and terms with multiple meanings” (p. 10). As such, literate students who also master the mathematics language register (MLR) could be considered biliterate. So, ELLs must learn the English language at relatively high levels in addition to learning the language of the subject (content) area tested.

Finally, Francis and Rivera (2007) discuss *academic registers* which consist of higher-order thinking and writing skills such as reading abstracts and writing reports, and *sub-registers* which are directly related to different disciplines such as science, economics, and so forth. In this case, the authors argue that English learners cannot access these “registers and sub-registers” with conversational English alone.

Similarly, Murphy et al. (2006) observed during their “linkage and alignment study” that “each content area has standards with unique traditions, lexicons, expectations, and assumptions” (p. 57). This presumably was why the assessments did not link up as closely as expected. Apparently, these unique attributes need to be learned and acquired almost

like an additional specialized language—a language that may not be included in ELP assessments. Therefore, we need to determine whether ELLs are “biliterate” both in terms of learning the academic language specific to the content area as well as the elevated English proficiency necessary to express this content knowledge in classroom settings and on standardized tests. ELLs need to have the opportunity to learn *both* the academic English language and the content/subject area in their instructional program.

Opportunity to Learn (OTL)

When examining ELLs’ academic success it is important to understand the link between what is on the subject matter tests and what ELLs are being taught in their classrooms. For ELLs, much of their classroom work centers on learning the English language. For example, in California, ELLs learn English based on the English language development (ELD) standards which are organized according to the strands of the English language arts standards. It is clear, however, that these ELD standards are not aligned with the subject area (content) standards (Murphy et al., 2006). One result of this disconnect may be seen in the consistent low achievement test scores for ELLs (US Department of Education, 2009). And while achievement gaps between ELLs and native English speakers still exist, it is also evident that many ELLs are behind grade level, thus prompting remedial or compensatory-type instruction. So combining remedial work with English proficiency instruction calls into question whether English learners are in fact receiving grade-level instruction—the grade-level subject area content that state tests measure. It is additionally troubling when results from these test scores are used for high-stakes decisions—whether to determine teachers’ salaries or for graduation. The *Standards* (1999) warn, “When test takers have not had the opportunity to learn the material tested, the policy of using their test scores as a basis for withholding a high school diploma . . . is viewed as unfair” (p. 76).

Herman and Klein (1997) provide a comprehensive framework of opportunity to learn that includes: curriculum content, instructional strategies, and instructional resources. Regarding *curriculum content*, the issue is whether ELLs have had the opportunity to learn the specific grade-level subject matter tested. Again, as discussed above, it is important to note that ELLs may not be receiving adequate grade-level content instruction while they are learning the English language. Abedi, Courtney, Leon, Kao, and Azzam (2006) found when analyzing data for eighth grade algebra students that this was the case. They reported that ELLs were “in classes with less content coverage” (p. 73). This is problematic in that a rigorous curriculum is essential for subsequent college participation (Huber, Huidor, Malagón, Sánchez, & Solórzano, 2006).

Instructional strategies help learners acquire the skills necessary to compete and do well on state tests. The skill set that ELLs typically receive to meet English language development standards are less complex than the skills needed for learning the subject area content standards (Murphy et al., 2006)—especially in the higher grades (Kato et al., 2004). Test scores continually bear out the fact that ELLs score low on achievement tests in all content areas tested (US Department of Education, 2009). Clearly, ELLs are not receiving the necessary skills and content during their classroom instruction to do well on these tests nor are they receiving the “academic English” instruction to navigate the content areas—especially at the lower English proficiency levels.

And finally, *instructional resources* typically include quality teachers and up-to-date materials, for example, support staff, technology, labs, and so forth. The quality of teachers is paramount to ELLs’ success, yet in many cases, their teachers are the least qualified and least experienced. Furthermore, the lowest performing schools usually have more under-prepared teachers than high performing schools (Woodworth et al., 2009). Unfortunately,

in most cases, English-language learners attend these low-performing schools. Furthermore, quality teaching for ELLs also means having the ability to integrate English learning with content learning instruction. This level of training and skill is missing in many ELL classrooms.

These OTL components are absolutely necessary for ELLs to have a competitive chance at succeeding on subject area tests. In fact, McClung (1979) links OTL to “Instructional validity” in that “Instructional validity is an actual measure of whether the schools are providing students with instruction in the knowledge and skills required by the test” (p. 683). Yet not all schools are meeting this “validity” issue as ELLs’ English language proficiency level becomes the criteria for receiving quality subject-area instruction. The question is how do we get ELLs to an English language proficiency level in a timely fashion to benefit from content area instruction and where necessary, when do we insist on L1 instruction to get us there.

Discussion

English-language learners bring a unique educational attribute to the classroom—a different language. This language has historically been seen as a deficit by mainstream educational institutions rather than as an asset or “fund of knowledge” or as “capital” (Moll, Amanti, Neff, & Gonzalez, 1992), to be taken advantage of and built upon in the educational process. The deficit view treats their language as a problem that obstructs learning and subsequently creates a lower class of students who eventually do poorly in school and related tests. This self-fulfilling prophecy of poor achievement represented by traditional schooling practices and “deficit” thinking (Solórzano & Solórzano, 1995) has resulted in the acceptance of test use with ELLs that violates all of the tenets of test validity as put forth by the *Standards* (1999), the National Research Council (1999), and decades of research (Solórzano, 2008). That is, tests are being used to place, reclassify, evaluate, and promote ELLs when in fact the tests were not developed with these multiple purposes in mind.

Positive attempts have been made to link English language proficiency (ELP) assessments with ELP standards and subsequently state content standards and related content tests. This is a step forward. As this pedagogical link between ELP assessment and subject matter content moves along the ELL educational pipeline, the ultimate goal is improved classroom instruction that considers ELLs’ special language assets and provides them grade-level subject matter knowledge. However, it is not clear to date that English language proficiency tests can predict or prepare ELLs for subsequent academic English proficiency or subject area achievement. As a result, ELLs are typically tested on subject matter that they have not had the opportunity to learn. It is this opportunity to learn the subject matter that challenges teachers and test makers. Until ELLs’ language proficiencies (in both L1 and L2) can be maximized during instruction and assessment, no true achievement outcome in their second language can be assessed, much less used, for high-stakes decisions.

English-Only Movement

TERRENCE G. WILEY

English has long been the common and dominant language in the USA. Nevertheless, supporters of official English and restrictive English-only policies maintain that the common language is under threat from the numerous minority languages in the country (Crawford, 2008). The relationship between the dominant language and minority languages is often depicted as a struggle between the common language and minority languages. From a demographic perspective, however, it is important to understand that the vast majority—over 98%—of those residing in the USA speak English, and those who speak other languages are mostly bilinguals. Thus it is difficult to understand how English is under threat if most of those who speak other languages also speak English. One argument that can be advanced is that about one third of those who speak English do not speak it well, but there is evidence that those who do not speak it well desire to speak it better, as is evidenced by the demand for English as a second language programs (Wiley, 2005).

Historical Background

During the British colonial period, English achieved dominant status over other European languages in the colonies. Generally there was tolerance toward other European immigrant languages. Tolerance, however, did not extend to all languages and speakers. Enslaved Africans were not allowed to speak their native and ancestral languages, and, beginning in the late colonial period in the southern colonies, compulsory English illiteracy statutes were imposed whereby it became illegal for the enslaved to learn to read and write English. American Indians were generally treated as members of separate and subordinate nations with whom treaties could be negotiated. There were many efforts by missionaries to promote literacy in indigenous languages, largely as a means of proselytizing Indians, as well as attempts to teach them English. During the American Revolution, one of the first acts of the Continental Congress was to pass an appropriation for Indian education for the purpose of pacification (Wiley, 2000, 2004).

The question has often been raised regarding why the USA did not designate English as an official language in the US Constitution of 1789. There are several reasons. First, the dominance and common utility of English was self-evident—it functioned as if it were the official language; second, the founders were generally tolerant toward language diversity and minority rights, except toward the enslaved; third, they did not want to offend speakers of European languages other than English who had just supported the revolutionary cause against England. Thus its functional role and status precluded the need for its “official” designation (see Heath, 1976a, 1976b; Daniels, 1989; Baron, 1990).

In the early 19th century, there was a considerable effort to promote a standard American English, or “American language,” though this was through private commercial means, rather than official governmental means. Largely through the efforts of Noah Webster, the focus was on regularizing spelling and pronunciation of the language. Webster wanted to differentiate the standard American variety from the language of the English. He was generally more preoccupied with eradicating regional variations in American English, and

2 ENGLISH-ONLY MOVEMENT

in making the spoken form conform to the written, than with defending the language from threats from other languages (Simpson, 1986).

From the early years of the Republic through the mid-19th century, the federal government pursued an aggressive agenda of territorial expansion. As a result of annexation, military conquest, and imposed treaties, numerous indigenous and nonimmigrant language minority peoples were incorporated from the former French Louisiana territory, former Spanish Florida, as well as Texas and other former Mexican territories. After English was briefly designated as the official language of the newly annexed Louisiana Territory, there was some initial resistance, so French regained standing with English in Louisiana. The federal government chose not to impose English on its newly acquired territories from Mexico in the southwest.

Up to the Civil War (1861–65), attitudes and policies toward language diversity in the USA were mixed. There was relative tolerance toward European immigrant languages in many states. In 1837, for example, Pennsylvania passed laws allowing for German bilingual education (NEA, 1987). There were, however, strong anti-immigrant sentiments, particularly in eastern urban areas with large immigrant populations. These were particularly evident in the Know Nothing movement of the 1840s and 1850s. The compulsory illiteracy laws, which were imposed on enslaved African Americans during the colonial period, persisted in southern states until the end of the Civil War. In the aftermath of the forced relocation of native Americans in the “Trail of Tears” (1831–38), some American Indian tribes, most notably the Cherokee, successfully ran their own schools and achieved impressive levels of native language literacy and biliteracy in English. In the latter decades of the 19th century, however, English-only boarding schools became a tool for the deculturation of native cultures and “pacification” of Native Americans (Wiley, 2000).

From 1867 to the end of the Spanish American War (1898–1901), the USA added Alaska, Hawaii, the Philippines, and Puerto Rico to its growing international empire. English education was imposed in Puerto Rico and the Philippines, and, in the case of Hawaii, the native language was restricted. On the US mainland, high levels of European immigration increased until World War I. During the war, there was a wave of anti-German sentiment and widespread xenophobia which culminated in English being designated as the official language in a majority of states. In some states, such as Nebraska, it became illegal to teach German or foreign languages in lower grades. In 1923, the Supreme Court (*Meyer v. Nebraska* 262 US 390) ruled against the Nebraska English-only statute. The ruling, however, was a partial victory for English advocates, because it affirmed right of states to require English as the medium of instruction. English-only boarding school instruction for American Indian children persisted into the early 1930s (Wiley, 2000, 2004).

Following World War II, language minority issues increasingly came to be seen in the light of federal racial desegregation initiatives. The correlation between low educational achievement, racial segregation, and language minority status—particularly for students of Mexican origin—became a focus of civil rights advocates. By the mid-1960s, bilingual education came to be seen as an appropriate accommodation for non-English-speaking minority children. In the wider sociopolitical context, bilingual accommodations were also allowed for voting and legal proceedings. Following the failure of the San Francisco school district to provide any accommodation for non-English-speaking immigrant children of Chinese origin, the Supreme Court ruled in *Lau v. Nichols* (414 US 563, 1974) that schools had to provide some proactive means of teaching English and making the curriculum comprehensible. These victories of language minority advocates were short-lived, however, because by the latter 1970s, bilingual education had come under attack by those who questioned any attempts to accommodate speakers of languages other than English (Wiley, Lee, & Rumberger, 2009).

The Rise of the Contemporary English-Only Movement

The contemporary English-only movement grew out of organized efforts in the 1980s to promote the official status of English while restricting bilingual accommodations. In 1981, Senator S. I. Hayakawa (1906–92), a Canadian immigrant of Japanese ancestry, semanticist and former president of San Francisco State University, introduced a constitutional amendment to make English the official language of the USA. That effort failed, and since the 1980s subsequent versions of the proposed amendment likewise have been unsuccessful.

To further his cause, in 1983, Hayakawa joined with Dr John Tanton, an ophthalmologist and proponent of population control and environmentalism, to found U.S. English (<http://www.us-english.org>). U.S. English was affiliated with the Federation for American Immigration Reform (FAIR), which lobbies for restrictive immigration policies. Initially, U.S. English was well funded with endorsements from well-known celebrities, including Walter Cronkite. Following the public release of a controversial internal memo by Tanton, which was seen as anti-Latino, Tanton resigned and some celebrities such as Cronkite disassociated themselves from the organization. Although efforts to promote a federal constitutional amendment to make English the official language have thus far been unsuccessful, U.S. English has pursued a more successful strategy in promoting English as the official language among the states, where some 26 have passed official English laws since the founding of the organization (NEA, 1987; Crawford 1992; Wiley 2004).

Another highly visible organization, English First (<http://englishfirst.org>), was established in 1986 with three goals: to (a) make English the official language of the USA, (b) allow children the opportunity to learn English, and (c) eliminate what the organization considers to be ineffective and expensive multilingual policies. The organization's first president, Larry Pratt, was also executive director of the Gun Owners of America as well as Secretary of the Council on Inter-American Security. The latter organization published a report in 1985 that depicted Hispanics as a national security threat and bilingual education as fostering cultural apartheid (NEA, 1987; Crawford, 1998; Wiley, 2004).

There has been organized opposition to the English-only movement, largely from academic organizations involved in language teaching and civil rights advocacy. In 1987, for example, English Plus (<http://www.massenglishplus.org>) was founded by opponents of English-only policies, who supported a cultural rights amendment which sought to promote linguistic and cultural diversity. A number of educational organizations have passed resolutions opposing English-only policies. These include Teachers of English to Speakers of Other Languages (TESOL), the Linguistics Society of America (LSA), the American Association for Applied Linguistics (AAAL), and the National Education Association (NEA). The major concerns posed by critics of the official English movement are that it threatens the civil rights of language minorities and the government's ability to accommodate their educational, economic, and political access. Beyond that, critics see the movement's priorities as working against the need to promote languages other than English which are needed to make American businesses more competitive in international markets (Crawford, 1998; Wiley, 2004).

One major criticism of the English-only Movement is its association with anti-immigrant agendas which have particular impact on Latinos. These policies received widespread endorsement by a majority of those voting. In Arizona, for example, voters have supported official English policies while also endorsing policies that make it illegal to teach English to undocumented adults. Given such widespread support, some scholars, such as Tatalovich (1995) have attempted to assess how deeply held the popular endorsement of English-only policies are and which elements of the population most supportive. Tatalovich concluded that the first phase of the movement was dominated by debates between elite politicians, who aligned with the issues largely along racial lines with pro-Latino politicians opposing

4 ENGLISH-ONLY MOVEMENT

English-only policies. The second stage involved mass activism along social class lines with the middle class largely endorsing English-only policies. The more recent phase at the national level has seen a strong linkage between English-only and anti-immigration policies. According to Tatalovich (1995), this third phase shifted emphasis from the states back to the federal level and is potentially more politically inflammatory than it was during the Americanization Movement (1914–25).

Other political scholars, such as Donahue (1995), have argued that the public debate over English-only policies has been made more controversial because of political opportunism:

What matters is that . . . to achieve leadership, one must first become widely known. In what seems to be an utterly cynical value, problems of truth and falsity can be dealt with not at the outset, but later . . . indeed, truth may simply be a matter of what one can get the public to believe. (Donahue, 1995, p. 117)

Propositions 227 and 203

In California, beginning in the late 1990s, Ron Unz, a private businessman, sponsored and succeeded in passing a controversial proposition (227) called “English for the Children,” which resulted in restricting bilingual education. The arguments for Proposition 227 advanced by Unz were based on the following premises: (a) English is the language of opportunity and social mobility; (b) immigrant minority parents are eager to have their children learn the language; (c) schools have a moral obligation to teach English; (d) California schools have performed poorly in educating immigrant children, as indicated by their high dropout rates; and (e) young immigrant children acquire second languages easily (Wiley, 1999).

Advocates of bilingual education generally had little argument with the first three assumptions regarding the importance of English and the necessity to teach it. The fourth assumption, however, that bilingual education causes high dropout rates among language minority children, was questionable at the time because only about 30% of California’s then 1.4 million language minority students had received any bilingual education support, prior to passage of Proposition 227, even though they were eligible. The fifth assumption, that young immigrant children rapidly acquire second languages was—and continues to be—the most controversial claim because it is not supported by research evidence (Wiley et al., 2009; Gandara & Hopkins, 2010). It is also contradicted by the fact that many English-speaking monolingual children have difficulties mastering English literacy skills in school (Wiley, 1999).

In 2000, Unz followed with another successful antibilingual education proposition (203), in Arizona. Again, since the passage of Proposition 227 in California and 203 in Arizona, there is little evidence that English-only education has improved educational performance and growing evidence that it has not (Wiley et al., 2009; Gandara & Hopkins, 2010). Unfortunately, during the political campaigns for Propositions 227 and 203, many news writers gave more attention to the anecdotal opinions of pundits opposed to bilingual education than to the findings of educational researchers. Since the implementation of Proposition 203 in Arizona, a controversial structured English immersion (SEI) model has been implemented requiring immigrant children to be separated from those in mainstream instruction for four hours per day. Researchers (Gandara & Hopkins, 2010; Lillie et al., 2010) have raised concerns that many children are falling behind their native English-speaking peers.

The Future: Beyond False Dichotomies

Whether future generations will be as favorable to English-only policies in the USA as those of the recent past remains to be seen. As long as the either-or logic of the English-only ideology prevails, in which a struggle between English and other languages for dominance is presumed, there can be little progress in expanding the linguistic capacity of the country. Fear of language conflict and bilingual education limits the opportunity to develop the linguistic resources of multilingual minority populations. Thus we may well wonder what the long-term consequences to American society will be, given the significant intergenerational loss of heritage languages (Rumbaut, 2009), which results for English-only educational policies. It is likewise apparent that foreign language teaching is on the decline (Rhodes & Puhfahl, 2010), which has implications for the USA's ability to function in the multilingual global society and be competitive in the global economy. With the vast majority of Americans speaking only English, surely the more serious issue facing the USA is how to retain languages being lost while expanding the teaching of the world's languages more broadly.

Epistemology and Ontology

GRAHAM CROOKES

Introduction

Since the 19th century, central concepts related to knowledge, of interest to philosophers, educators, and scientists, have been analyzed using a small group of primary categories; the core three are metaphysics, epistemology, and axiology. Within these, the large area of epistemology and a subcategory within metaphysics, namely ontology, are sometimes paired as terms of analysis to indicate important positions within the domain of research methodology that might be called the philosophy of research, and also as the basis for understanding positions in politics, pedagogy, and other similar areas. The two terms are often used together in introductory or preliminary discussions of research positions; second language (SL) authors often reference the co-authored works of Guba and Lincoln (e.g., 1994) as major sources for this. The terms are also of relevance to SL teachers and other professionals in the broad field of applied linguistics. In this chapter I will first define the terms “ontology” and “epistemology” as they occur within their home base of philosophy. then take up some points concerning their use in SL research as a practice intended to result in SL-related knowledge. Many of the issues involved have been in existence as long as humans have philosophized, theorized, and researched. It also seems that some of the same issues play themselves out repeatedly in different but related areas of our field. Thus the social nature of knowledge, the role of interpretation, the degree to which knowledge is well-founded, knowledge of language itself, and SL professionals’ knowledge all turn on epistemological and ontological matters.

Ontology Within Metaphysics

Metaphysics is the study of the most abstract, potentially universal, conceptions; philosophical systematizers conventionally break it into three parts: cosmology, theology, and ontology—the nature of what is. This study has not always been valued. Of the area of metaphysics as a whole, Hume (1748/2004, p. 107) wrote, “Commit it then to the flames: for it can contain nothing save sophistry and illusion,” a position endorsed later by the logical positivists. In the present context, ontology is seen as relevant to an understanding of research procedures and products in general, because all scientific theories, and by implication all research methodologies, have a metaphysics (Harré, 1985). That is to say, they all (explicitly or implicitly) take a position on the nature of the things to which they are referring, or the entities they are trying to identify or theorize, and the meanings of the basic concepts they are working with.

The use of the term or concept of ontology in research contexts is often related to whether researchers are trying to arrive at knowledge of an objective, real world, or to obtain knowledge of entities that are conceived as not “given,” that is, not independent of human action or of embeddedness in human culture. Attempts to deal with these matters have not been helped by the tendency to do so simplistically, with dichotomies being particularly pernicious. Thus if we say that there is a “real” world, the one apparently given to us by our senses, then the supposedly singular alternative position, once the first position has

taken hold of the label “realist,” is presumably “antirealist.” At this point those opposed to the first position are immediately backed into a corner by the “commonsense” question, “surely you are not saying that this world does not exist?” The response is to say, indeed, that is not what we are saying. But what is the position, then? It is that the ontological nature of the objects of the research inquiry are much less well-grounded than might otherwise be thought; that they have an existence, yes, but it is one made relative by their ineluctable implicatedness in human existence. Discussions of this topic in an SL context, and even in education contexts, have usually not been informed by a full awareness of the historical extent and diversity (beyond binaries) of the philosophical contexts involved.

Ontologies are often associated with one of three main schools of philosophical thought, namely idealism, realism, and pragmatism. Thus one can talk about an idealist ontology, a realist ontology, or a pragmatist ontology (and of course, many variants or intermediate positions). Similarly, ontological positions are referenced or specified in terms of other (grand) theories. In the past some spoke of a materialist (or dialectical materialist) ontology (Lenin, 1908/1972, p. 57); equally well at the present time one can refer to a “leftist ontology” (Strathausen, 2009). Thus in ontological explorations in SL research contexts we are concerned with what we mean when we say that a theoretical concept in our area exists and when we are obliged to specify or investigate its nature (e.g., Al-Amoudi, 2010). This applies to rules, to the nature of the SL learner, to language, to the entities “acquired” in second language acquisition (SLA) processes, to learner identities, to cognitive structures, and so on. Perhaps the most important ontological question or area facing SL researchers is to what degree the objects of their investigation, most obviously language, are socially constituted. This question, for example, is tackled by Zuengler and Miller (2006), whose entire discussion of the difference between cognitive and sociocultural views of language in SLA is specified in terms of ontological perspectives. Furthermore, if one accepts that some concepts (or objects) under investigation are socially constructed, one can then subject the term “society” itself to inspection. If a conflict theory of society is entertained, that means our basic understandings of language, or of the person, are themselves socially constructed in a contested manner. If a critical theory of society is to be engaged with, a critical ontology follows, in which the ontological status of a language, for example, might be seen as having, say, an inherently patriarchal or class character. Or for example, concerning discourse, it would be found to have a strong tendency to obscure (to the benefit of a ruling class) as opposed to be transparent, or to manifest understandings accompanying those of indigenous people or other oppressed groups in colonial or postcolonial social contexts (see Kincheloe, 2006). Finally here, note that though most ontologies refer to “substances,” it has also become possible to refer to “process ontologies” (Thorne, 2005).

Epistemology

Epistemology is the domain of philosophy which concerns the sources and nature of knowledge. This entry is concerned with research as a source of knowledge, though other sources are recognized in epistemological discussions. For example, in societies where particular forms of religion (especially charismatic or fundamentalist) hold political power and strongly influence what passes for knowledge, revelation and authority are two such sources. Intuition is a source of knowledge that has been identified even by some mainstream philosophers such as Kant. However, in secular societies, two sources are given general lip service: reason—that is, the exercise of rational judgment—and empirical research.

Scheffler’s (1978) review of this area helps identify some subdomains within epistemology. He identifies the question “what is knowledge?” as the primary focus of epistemology, but provides four other related questions:

[Second,] the evaluative question: "What knowledge is most reliable or important? . . . [which] asks for a classification of sorts of knowing . . . [Third,] the genetic question: "How does knowledge arise?" To answer this question is to give an account of the processes or mechanisms by which knowledge develops; it is, typically, to provide some model of the mind that may render learning processes intelligible. Fourthly, there is the methodological question: "How ought the search for knowledge be conducted?" . . . Fifthly . . . the pedagogical question: "How is knowledge best taught?" (p. 5)

Besides the matter of knowledge itself, SL specialists must concern themselves with sorts of *knowing*, an important area for us, reflecting our ontologies of language. The "genetic" question is equally important. Considering the genesis of knowledge, one epistemological position allows for innate knowledge of language; others dispute this or emphasize that knowledge comes about through learning. And as a consequence, arguments among those concerned with universal grammar-based theories of SLA are often framed using the term "epistemology." Thus theories of learning in general or SL learning in particular, inherently important for the teacher and potentially important for the researcher (as a person engaged in learning about a phenomenon), come in here. As White (1998, pp. 3–4) says,

That area of philosophy known as epistemology has been concerned with questions of how knowledge is acquired and the distinction between knowledge and belief . . . Questions about how we learn are closely related to these epistemological preoccupations and rest on them to a large extent. The scientific enterprise of learning theory rests on a variety of related epistemological positions and cannot be understood except in terms of them.

The fourth of Scheffler's questions raises the matter of the search for knowledge. This requires addressing both (a) the philosophy of scientific research methods and (b) the status of professional knowledge vis-à-vis scientific knowledge. Applied linguistics has certainly concerned itself with the first area in the past, and recently has begun to develop a literature in the second area.

After a period of struggle and confusion, the SL field seems willing now to encompass a plurality of research methods, with their diverse epistemological associations. This is consistent with general positions in educational and social science research (even including psychology) and is signaled by the increased acceptance and promotion of "multiple methods" (e.g., Creswell & Clark, 2007). Nevertheless, substantial differences concerning epistemologies of inquiry persist. The most obvious one concerns the matter of interpretation. At one end of a spectrum of positions, interpretation is to be minimized through investigative practices which support objectivity (or intersubjective agreement), and to be corrected out of existence through, eventually, peer review and replication or disproof. Alternatively, interpretation can be seen as inherent to human perception, and a process without which there is no understanding in the first place; as crucial to the study of, in particular, social matters, so that informed and possibly guided subjectivity is actually the desired target. Although the position favoring interpretation still seems more radical (and this is because of the persistent dominance of "scientism" in popular culture), it has coexisted with the other extreme position within European philosophies since the earliest times (all the way back, that is, to ancient Greek philosophies; not to mention similar distinctions to be found in Chinese and Indian philosophical systems). Since SL research is an interdisciplinary project, we may see these different positions as reflecting allegiances to other SL-related disciplines, with some SL researchers orienting to cognitive science conceived of as objectivist and others orienting, say, to anthropology, with its long-standing interpretivist stance. (Or equally, in pursuit of historical awareness, we may come to see this as reflecting the *Methodenstreit* ['methods debate'] which engaged the social sciences in Europe shortly after their creation, during the late 19th century.)

Modern analytic philosophy has mostly presented epistemology as individualistic in nature, but in the last few decades a social epistemology has been developed. This is part of the coming together of philosophical and sociohistorical empirical studies of knowledge, following Bachelard (e.g., 1936/1984; Tiles, 2005) and Kuhn (1962). Social epistemology (as its name suggests) emphasizes studying the way knowledge arises from and is supported by social forces and practices. A critical spin on this was visible in sociological analyses of the history of science (e.g., Barnes, 1974) which brought out the role of power, or of socially located perspective, or the influence of other theories (such as racist, eugenicist, or imperialist theories of humanity) in the development of ideas that were given (for a while) the backing of science. The European tradition in the history of ideas (e.g., Canguilhem, 1988; directly following Bachelard) flowered in the work of Canguilhem's student Foucault, whose well-known theorizing of the interrelationship of knowledge and power leads to a position summarized by philosopher of education Noddings: "Many philosophers today suggest we abandon traditional questions of epistemology, and describe truth locally, as a function of power or as an artifact of language and question the extent to which true statements can point to things outside language, while still being able to be truth-telling (or lying) within specific contexts" (Noddings, 1995, p. 105). Recent years have also seen the development of "standpoint epistemologies," of which feminist epistemology is the best-known. This position asserts that the inner view is more authentic, above objectivity; bias (reconceptualized as a standpoint) is unavoidable, and the only way to avoid pernicious bias is to include the views of all interested parties in accounts and arguments, rather than attempt to screen them out. Finally here it may be noted that epistemology, historically, has tended to be descriptive, but it is possible to develop a prescriptive or normative epistemology by bringing in aspects of axiology (i.e., ethics). A normative social epistemology of research leads to the position that research knowledge must be useful, otherwise its conduct is in some sense unethical.

Theories of Knowledge in Mainstream and Second Language Research

Epistemology also encompasses the development of theories of knowledge, important (obviously) because knowledge is the product of research. These theories can be placed on a spectrum between foundationalist and antifoundationalist poles; the latter pole has more recently come into a primary position. Foundationalism advances the position that truth claims can be based in some indubitable or self-justified beliefs. Logical positivism was a foundationalist enterprise, aimed at arriving at statements about reality that could be verified; its core position in this area was known as verificationism. Quine (1969) and Popper (1959) subjected this position to sustained critique, maintaining (successfully) that while normal methods of science can plausibly establish the falsity of general statements, they cannot establish the truth of such statements. In the absence of a verificationist position (that of the logical positivists), a historical, or temporal, account of how knowledge has been arrived at is to be used to justify it. That is, we are persuaded of the plausibility of a statement, even one arrived at through quantitative procedures, through its support, which comes from the social processes of scientific reporting and judgment exercised through a public process of peer review and follow-up work.

It is valuable to trace this mainstream scientific position, of Popper, back a few steps. It is similar to that of the pragmatists, such as Peirce and Dewey (Hutcheon, 1995). Dewey's epistemology, like most of his work, reflects his interest in unifying dichotomies opened up by the two major philosophical schools of his time: idealism and empiricism. The first

assumes that knowledge is of ideal forms; the latter that it is of the real world, to which we are assumed to have more or less direct access. Dewey based his position on our status as human beings in the real world, and indeed as beings subject to evolution. Thus for him, knowledge was only obtained through our action on the world, and in some sense subject to survival constraints (see Boyles, 2006).

Emphasis on the reciprocity of theory and praxis, knowledge and action, facts and values, follows from [a] post-Darwinian understanding of human experience, including cognition, as a developmental, historically contingent process. (Siegfried, 1995, p. 730)

Dewey's position also suggests a way to cut through the common theory/practice division: theoretical knowledge is that which is arrived at through practical inquiry (usually by teachers) when reflected upon and tested in practice.

Then just as language can be seen as having structure, but also as socially created and manifested, as individual but also social in nature, so can knowledge. Knowledge can be seen as knowing, and as itself a social practice rather than something individual. This is equivalent, in epistemology, to moving from an individualist, foundationalist epistemology toward one which is more social and antifoundationalist. Besides Dewey, the influential work of Thomas Kuhn on the social dimensions of scientific theory test and lend further support to the social, antifoundationalist position on knowledge, as did the philosophical work of Gadamer (e.g., 1960/2004).

Gadamer's view was that it is a mistake to think of knowledge (knowing-that, but also knowing-how) as something that occurs outside the traditions in which we are brought up and through which we are taught to see the world. Instead, we should see knowledge as something that occurs in our interaction with the world by means of these traditions.

What Gadamer struggled against—and what Descartes and Hegel were struggling for—was the idea that there could be a pure standpoint, untainted by our traditions and our prejudices, from which any knowings-that could be had . . . Gadamer denied that there was any such kind of pure knowledge. He argued forcefully that in order for there to be knowledge there had to be language, and that language always occurs in the context of traditions in which viewpoints develop, social relations form, and individual lives unfold. (May, 2001, p. 79)

This position emphasizes the importance of our own locally situated, locally developed knowledge, even in the generation of research-based knowledge. It also suggests the possibility that knowledge tends to be "interested," that is, again, reflects the views, traditions, and standpoints of those who create it.

In due course, the understanding of knowledge as a social practice has joined with lines of influence deriving from sociocultural theory and activity theory and has become more prominent in mainstream social science and in studies of language learning and teaching. Given the organizational locations of SL research and teaching, an interpretation made of this perspective by organizational theorists and knowledge utilization researchers ought to be useful. Orlikowski (2002, p. 249) refers to this position as

a perspective on knowing in practice which highlights the essential role of human action in knowing how to get things done in complex organizational work. The perspective suggests that knowing is not a static, embedded capability or stable disposition of actors, but rather an ongoing social accomplishment, constituted and reconstituted as actors engage the world in practice.

Thus researchers' knowledge is not necessarily the knowledge of an individual scientist or researcher, but rather the knowing practices manifested by groups of scholars (and teacher-researchers) in social organizations under better or worse (emancipatory or oppressive) conditions.

Constructivist Epistemology and Second Language Research Knowledge

A constructivist epistemology derives substantially from Kant (1998), who rejected both the innate ideas view of rationalism and the position of the early empiricists. Kant's opinion was that we can never know the world in itself, only the world as it is constructed. Piaget (e.g., 1937/1954) developed Kant's position by saying that Kant was wrong in thinking of these structures as static and given. Like rationalists, Piaget assumed mechanisms of mind that make knowledge possible, but like empiricists, he theorized that organisms test their knowledge against the world of sensory experience (thus to some extent his is a non-foundational epistemology). The position that knowledge is constructed by learners and is not the result of passive reception has now produced several varieties of "constructivism."

Thus, we can talk about weak as well as strong constructivism. Then, much learning takes place in social interaction rather than just working with the environment, or "facts" alone, and this takes us to the Vygotskian variant: social constructivism. If we say "all knowledge is mediated by our cognitive structures and theories," we can go on to say (following Hegel: Westphal, 2003) that those structures are social and historical in nature; if we add the possibility that these are almost always accompanied by real-world cultural artifacts which play a crucial role in learning we are then in the realm of "activity theory" (a.k.a. sociocultural historical theory, with its own epistemological positions; see, e.g., Thorne, 2005). Finally, radical constructivism emphasizes the way that a person's experienced world is what is arrived at through the process of knowing rather than the discovery of a pre-existing world. Most of these varieties of constructivism have had influence on SL and foreign-language teachers' understandings of how students learn (Reagan, 2002). They also apply to the researcher's discovery processes, a form of learning, within the social processes of science.

Knowledge of Second or Foreign Languages and Language Teachers' Knowledge

SL researchers are of course quite familiar with the always-continuing debate concerning what knowledge of language really is; that is, answers to the question "What does it mean to know a language, or a second language (L2)?" In particular, in contradistinction to the early concern of epistemology with propositional knowledge, many SL researchers would accept that knowledge of a language includes "knowing how" (Ryle, 1949, pp. 29, 38). In addition, this "know-how" pertains not just to the construction of grammatically correct sentences. It also involves knowledge that enables those sentences to function effectively when communicating within another culture; in which case, knowledge of language has to be encased within knowledge of a (second) culture (cf. Gadamer, 1960). This is knowledge also accessed and utilized by SL professionals in general, most obviously SL teachers.

I conclude this entry with a brief reference to the matter of teachers' knowledge, because many (though not all) SL researchers would regard L2 research as of limited worth if not contributing to the knowledge of L2 professionals. For this topic, on one hand we have, in the SL domain, work on teachers' knowledge of SL research of (e.g., Bartels, 2005). We can assume that some of the knowledge Bartels identifies (formal knowledge of language

and of SLA, and knowledge about applied linguistics) that derives from SL research is of a more or less propositional nature, and thus unproblematic. On the other hand, we have work in mainstream education. Munby, Russell, and Martin (e.g., 2001) have summarized characterizations of teachers' knowledge from 20 years' work in the area. These and other researchers of teachers' knowledge (including SL specialists) have noticed its sometimes tacit, knowledge-in-use character and suggest that it may be embodied in scripts, rules of practice, metaphors, narratives, and cases, and have thus pointed out its situated, particularistic, and nonpropositional nature (see Crookes, 2009). The transliteration of Ryle's dichotomy to the cognitive terms "declarative knowledge" and "procedural knowledge" is also relevant. It raises (once again) the matter of how formal, theoretical knowledge gets (or does *not* get) transformed into practice. The idea that knowledge of practice begins as declarative knowledge and when automatized becomes procedural knowledge, mentally encoded in a nonpropositional form, provides another partially useful metaphor for understanding the difficulties implied by the theory/practice divide (though it suggests a fairly high level of ontological complexity). It has been suggested that the term "praxis" (theoretically grounded knowledge, reflected on) overcomes this problem (see Pennycook, 2004). It is thus not possible to bring this discussion of extremely long-standing matters to a simple conclusion. Rather, it seems important to note that the status of the final destination of SL research-based knowledge (the SL professional) is epistemologically and ontologically unclear at the present time, a matter likely to justify further investigation and analysis of SL ontologies and epistemologies.

Erickson, Frederick

ALLA V. TOVARES

Frederick D. Erickson is George F. Kneller Professor of Anthropology of Education at the Graduate School of Education and Information Studies and an affiliated professor in the Department of Applied Linguistics at the University of California, Los Angeles. Erickson's work has made significant contributions to the theory and methodology of applied linguistics, especially in the areas of ethnography, discourse analysis, and sociolinguistics. Erickson has explored face-to-face interaction in institutional and familial settings and has an impressive research and publication record. Through the lens of microethnography, Erickson has advanced conceptualizations of listenership as a type of active engagement in interaction and has worked extensively on the musicality of speech. He pioneered multimodal discourse analysis, linked analysis of talk with social theory, and fostered interdisciplinary research and practice.

Biography

Frederick Erickson began his academic career at Northwestern University as an undergraduate majoring in composition and music history, earning his Bachelor's degree in music in 1963. He also earned his Master's degree in music history (1964) from Northwestern. It was his interest in music and ethnomusicology (Erickson's teacher was the renowned ethnomusicologist Alan Merriam) that not only profoundly influenced his understanding of everyday discourse, but also shaped his lifelong commitment to education, its theory and practice. As an undergraduate student, Erickson formed a volunteer music-tutoring program in one of Chicago's inner-city neighborhoods. As a result of this experience, Erickson was employed full-time in youth work, concentrating on employment and literacy education. He was also involved in the civil rights movement and community organizing.

Erickson returned to Northwestern University to pursue graduate studies in anthropology and education. As a graduate student, Erickson was influenced by his professors Edward T. Hall, Ethel Albert, and Paul Bohannan. The scholars whose work has influenced Erickson's research include John Gumperz, Dell Hymes, Erving Goffman, Gregory Bateson, William Labov, Adam Kendon, Courtney Cazden, and Emanuel Schegloff. Since receiving his PhD in education in 1969, Erickson has been on the faculty of the University of Illinois-Chicago, Harvard University, Michigan State University, and the University of Pennsylvania. He also taught at several Summer Institutes of the Linguistic Society of America, was a visiting professor of linguistics at the University of Konstanz, Germany, and a visiting scholar at the Center for Multicultural Education at the University of Washington. Erickson has served on the editorial boards of *Teachers College Record* and *Research on Language and Social Interaction*. Erickson's contributions to the field of anthropology of education have been widely recognized. He is the recipient of numerous awards and distinctions; among them are the George and Louise Spindler Award for outstanding scholarly contributions to educational anthropology and the Spencer Center for Advanced Study in the Behavioral Sciences and the Annenberg Public Policy Center Fellowships. Erickson's Web page is <http://www.gseis.ucla.edu/faculty/members/erickson>

Institutional Discourse and Gatekeeping Encounters

When he was 28 years old, Erickson began working on the project that would become a seminal work on institutional discourse: *The Counselor as Gatekeeper: Social Interaction in Interviews* (Erickson & Shultz, 1982). Together with Jeffrey Shultz, Erickson analyzed audio and videotaped academic advising interviews between junior college students and their advisors. Erickson and Schultz brought to the forefront the concept of institutional gatekeeping as a type of an encounter “in which two people meet, usually as strangers, with one of them having the authority to make decisions that affect the other’s future” (p. xi). Through a detailed analysis of verbal and nonverbal behavior of the students and their counselors, the authors demonstrated that counselors, as “institutionally authorized gatekeepers,” were more likely to judge than to advocate for the students whose patterns of behavior—including speech, gestures, eye contact—differed from those of counselors’. At the same time, a shared background established an advisor–advisee comembership, an advantageous outcome for the students.

This work highlighted that in institutional settings people who come in contact with one another “may come from different speech communities even though they are members of the same linguistic community” (Erickson & Shultz, 1982, p. 8). For instance, *The Counselor as Gatekeeper* explained how mismatched patterns of speaking and listening created uncomfortable moments between White counselors and their African American counselees. Specifically, while White participants kept eye contact during listening and would break their gaze when speaking, African Americans demonstrated a reversed pattern: they kept eye contact when speaking and would break it when listening. The study revealed the inner workings of race, class, gender, ethnicity, language, and culture in institutional gatekeeping encounters.

Speaking and Listening

The Counselor as Gatekeeper was influential in identifying listenership as an important element in interaction. Erickson (1986) further elaborated on the role of the listener on the speaker and metaphorically compared the complexity of speaking to another person to “climbing a tree that climbs back” (p. 316). Erickson conceptualizes listening and speaking as inextricably linked, and the listener as “an active agent in the joint production of oral text” (p. 300). Furthermore, speakers’ expectation of how listeners should signal their interactional involvement is based on the patterns of their (sub)cultures. Erickson’s analysis of a videotaped job interview shows that the interviewee’s speech became more hesitant when the interviewer broke eye contact and regained fluency when the interviewer restored eye contact. During a retrospective viewing session (a research technique Erickson was among the first to use to analyze discourse), the interviewee, an Italian American, indicated that he perceived the lack of eye contact as the absence of interest on the part of the interviewer. The interviewer, a German American, explained his behavior as an attempt to create a more relaxed atmosphere because he noticed that the interviewee was nervous. These mismatched expectations of how to show listenership resulted in “complementary schismogenesis” (Bateson, 1972), or increasing distance and misunderstanding between the interlocutors who did not share (sub)cultural patterns. The findings of Erickson’s research are in line with the instances of the mismatched interactional styles elucidated in research by Gumperz (1982a, 1982b) and Tannen (1984). Erickson’s work shows that any interaction is a joint activity, and speakers’ discourse is affected by the perceived (in)adequate listening response.

The Musicality of Speech

Erickson's understanding of social interaction as a joint production is reflected in the type of transcription notation that he uses to represent real-time face-to-face communication (e.g., Erickson, 1982a, 1982b, 2003). A trained musician, used to recording musical performances, Erickson has applied his skills as a performer and his knowledge of music history and ethnomusicology to everyday interaction and put forward a type of "quasi-musical" transcription of talk. Edwards (2003) refers to such transcription as "partiture notation" in which

turns by different speakers are put on different lines in a manner similar to instruments on a musical score. This form highlights the collaborative aspect of interaction—that is, that discourse is a unified "accomplishment" achieved jointly by multiple participants. (Edwards, 2003, p. 327)

Erickson's "partiture notation" was further validated by Scollon (1982), a linguist and a musician himself, who also, and independently from Erickson, used a quasi-musical type of notation to transcribe everyday talk.

Erickson uses "quasi-musical" notation to indicate the relative temporal location of stressed syllables within intonation units (1982b) and timing of talk in classroom discourse and in family dinner interaction (1982a, 1992, 1996). Erickson's work demonstrates that the musicality of speech "focuses the listener on key information points in the speech stream and cues moments of what conversational analysts have called 'transition relevance' at which turn exchange between speakers is appropriate" (Erickson, 2003, p. 12). Such moments of "transition relevance" coincide with the moments when listeners can provide verbal or nonverbal feedback to speakers. Further elaborating on the musicality of speech, Erickson shows how cadences, or rhythmic patterns that typically occur at approximately equal intervals in time, allow listeners to "anticipate a tactically crucial next moment, as signaled by speech prosody" (2003, p. 32). Erickson (1996) also uses Greek notions of *chronos* and *kairos* to further explore the idea of timing in talk as linked to the rhythmic organization of face-to-face interaction. While *chronos* refers to a technical "clock" understanding of time, *kairos*—which is of more interest for Erickson—is "humanly experienced" time, a social sense of time. Erickson shows that it is *kairos* that enables some students to anticipate the next moment in interaction and "steal turns from other children who were teacher-designated speakers" (1996, p. 37).

Multimodal Analysis of Talk

In his analysis of everyday face-to-face interaction, Erickson pays careful attention to the kinetic or paralinguistic activity of interlocutors: how gaze, posture, and gesture co-occur with speech and influence verbal behavior. Since his early work (e.g., Erickson and Shultz, 1982; Erickson, 1982b), Erickson has been using videorecording as a method of capturing both verbal and nonverbal aspects of interaction, and his transcripts typically include detailed diagrams of the postural positions, interpersonal distance of the speakers, and descriptions of other paralinguistic activity.

In his study of a dinner table conversation in an Italian-American family, Erickson (1982b) shows how, in the course of a dinner, the rhythm of talk is interrelated with the rhythm of people's actions, and the body movements of the participants correlate with phonetic emphasis of speech. Erickson argues that discourse coherence is achieved through a careful coordination of verbal and nonverbal resources and strategies: "Taken together, the

simple syntax, simple speech rhythm, and obvious table geography are sets of resources that make for an almost foolproof system for fluent production of topical items in real time" (1982b, p. 62).

Talk and Social Theory

For Erickson, talk is not only a joint production of speakers and listeners achieved through verbal and nonverbal resources, it is a social construction. Erickson's interest in linguistics stems from his concern with social and educational processes. He often collaborates with teachers and focuses on social interaction as essential to the learning process. In "Going for the Zone" (1996), Erickson analyzes classroom interaction against the backdrop of neo-Vygotskian theory of learning. Elaborating on Vygotsky's (1978) notion of the "zone of proximal development" (a range of what children can do independently and what they can achieve with the help and guidance from others), Erickson examines various aspects of real-time social interaction in the classroom. He goes on to suggest that, "as teachers and students interact in classrooms, they construct an ecology of social and cognitive relations in which influence between any and all parties is mutual, simultaneous, and continuous" (Erickson, 1996, p. 33).

In his recent book, *Talk and Social Theory* (2004), Erickson links a detailed analysis of specific interactions, or microethnography, with larger social structures, bringing together the "micro" and the "macro" in his analysis of social interaction. For Erickson, neither "macro" nor "micro" is sufficient in isolation; instead, only in the "tension of paradox" can they be studied and understood (Erickson, 2004, p. 197). He stresses the active role of interactants who do not merely adopt and follow social rules, but rather adapt to those rules in creative ways (p. 163). Erickson puts forward a metaphor of "wobble room" to show how people, in a selective "bricolage-like" manner, appropriate existing social structures and instruments (with their affordances and constraints) and put them "to new and uncommon use" (p. 173). Erickson's work suggests that social theory can benefit from a detailed analysis of everyday interaction as a site where the local and the global are at play. This book received an Outstanding Book Award for 2005 from the American Educational Research Association.

Ethical Debates in Research on Language and Interaction

MAGDALENA KUBANYIOVA

When we talk about ethics in applied linguistics research, we typically refer to at least two distinct, albeit interrelated, areas: an ethical conduct in research involving human subjects and the moral ends of our research activity. The first set of concerns has traditionally been embedded in institutional review boards (IRBs) or codes of ethical practice, such as *Recommendations on Good Practice in Applied Linguistics Research* (BAAL, 2006) or *TESOL Quarterly Research Guidelines*. With a few exceptions, these have until recently not received much scholarly attention beyond the routine treatment in research methods manuals. On the other hand, engagement with values and moral purposes of applied linguistics research has been pursued alongside the epistemological debates in the field (Cameron, Frazer, Harvey, Rampton, & Richardson, 1994; Firth & Wagner, 1997) and reflections on the relevance and social use of applied linguistics has become even more prominent in recent years. For example, the key theme of the annual meeting of the American Association for Applied Linguistics (AAAL) in 2009 concerned the relevance of applied linguistics to the real world and the usefulness of applied linguistics research for language teachers was explored at the annual conference of the International Association for Teachers of English as a Foreign Language (IATEFL) in the same year. Scholars have examined the values and purposes of applied linguistics in general (Bygate, 2005), or in relation to specific subdisciplines, such as language testing (McNamara & Roever, 2006), language teaching (Johnston, 2003; Crookes, 2009), forensic linguistics (Shuy, 2009), or second language acquisition (Ortega, 2005; Thomas, 2009).

Nevertheless, an increasingly changing landscape of language and interaction research involving diverse linguistic, sociocultural and sociopolitical, virtual as well as material, contexts, collaborative research relationships or multimodal means for collection, analysis, and presentation of language data has renewed the urgency with which the field needs to engage with both moral ends and moral conduct. The purpose of this entry is to offer an overview of key themes in the current debates on these issues.

The General Landscape of Ethics in Research on Language and Interaction

Most language and interaction research requires ethical clearance typically granted by IRBs or similar institutional bodies. The general ethical criteria which inform these procedures are typically derived from three core principles that serve as moral standards for research involving humans: *respect for persons*, which binds researchers to protect the well-being of the research participants and avoid harm or potential risks or both; *beneficence*, that is, ensuring that the research project yields benefits while minimizing harm; and *justice*, or in other words, a fair distribution of research benefits. To comply with the first principle, language and interaction researchers are typically required to produce evidence of informed consent and of measures taken to protect the participants' privacy and maintain anonymity. The principles of beneficence and justice have received far less attention in IRBs or

codes of practice and the usefulness to communities who participate in our research and who are supposed to benefit from it is typically interpreted only in the sense of offsetting potential risks, or in other words, to establish the so-called “risk/benefit ratio.”

However, debates about both these principles are alive and well outside the procedural ethics framework. For example, Ortega (2005) has argued that the principle of justice has been consistently overlooked in certain domains of language and interaction research. She has warned that the requirement of fair distribution of research benefits becomes problematic when certain types of L2 populations are persistently neglected, which, as she argues, is overwhelmingly the case in instructed SLA research.

Similarly, the principle of beneficence and, more broadly, relevance and social utility has been debated among applied linguists. Bygate (2005), for instance, has proposed a definition of applied linguistics as a “pragmatically motivated study of language” (p. 571), highlighting the need to *address* rather than simply *describe* real-world problems. Ortega (2005) has maintained that engaging with the social usefulness of applied linguistics research should be no less important than maintaining methodological rigor or examining epistemological assumptions and the calls for including social value in the criteria of quality of both quantitative and qualitative research resonate across the articles in the same special issue of *The Modern Language Journal*.

An interesting line of argument has been put forward by Cameron et al. (1994) who have questioned the adequacy of traditional ethics as a guiding framework for language research, because, as they argue, such a model is based on a positivist view of research that is primarily *on* rather than *for* and *with* the human subjects. They propose *advocacy* and *empowerment* as alternative ways of thinking about and doing language research and highlight interaction with the researched as a central criterion of worthwhile and beneficial research. Even they admit, however, that such approaches may not be possible or even desirable in certain research contexts. Indeed, concerns expressed within forensic linguistics (Shuy, 2009) or ethnography (Hammersley, 2006) about the problematic nature of the advocacy or empowerment stance make it apparent that debates on what constitutes ethical language research practice are far from resolved with the introduction of these alternative frameworks, and the contours of the ethical landscape in this area are far from drawn.

Related to the notion of social utility are concerns about the actual use or, as Shohamy (2004) clearly illustrates, misuse of research results. She rejects the notion that the researcher’s task is complete once the report has been handed in. Ethical research, she argues, implies research that is socially responsible and that, in turn, may require the researcher to get actively involved if their results are misused to justify unethical policies. Although Shohamy has referred to language testing research in particular, her arguments strongly resonate with many other areas of language and interaction research.

As can be seen from this overview so far, the field is conscious of and has engaged with some important debates on ethical research practice. What is therefore somewhat perplexing is the silence on ethical issues in most current overviews of language research (see Thomas, 2009). This overall tendency may be due to the fact that researchers working within the positivist paradigm tend to treat ethics in the same vein that is suggested in IRBs. That is, ethical practice is ensured if rigorous procedures have been followed and ethical clearance obtained. As the examples from research practice documented below demonstrate, however, this is rarely (if ever) the case in research involving humans. On the other hand, ethical considerations related to moral ends of research, including values and ideologies, have been an intrinsic concern of researchers working within, for example, the critical paradigms. Values, however, are always guided by beliefs about how things ought to be and it is only natural that values of those initiating or pursuing research may clash with those participating in it, using it, or funding it. A deeper and more explicit

engagement with ethical research practice seems therefore warranted on both accounts. What follows in the next section is an illustration of some specific ethical concerns which have been raised by language and interaction scholars in recent years.

Selected Ethical Debates in Applied Linguistics

Managing Research Relationships: Endangered Language Documentation Fieldwork

Holton (2009) reflects on his engagement in endangered language documentation fieldwork in two distinct geographical and sociocultural settings, Alaska and eastern Indonesia. Although the purposes of his projects were similar in both contexts, the two settings required a very different application and interpretation of ethical principles. For example, while the idea that the researcher might profit from the products of the language documentation project was considered unethical and was likely to cause resentment and closed doors in Alaska, forfeiting economic gain in eastern Indonesia could easily be interpreted as ignorance of or even disrespect for the locally established traditions.

Another issue, also echoed in the work of O'Meara and Good (2010), concerns the notion of community and the ethical principle of community-based research. Holton problematizes the concept of community, pointing out that although its boundaries may be clear to an outside body, such as a funding agency or even a researcher who has not as yet been socialized into the research environment, a layered picture emerges when community is defined locally. Therefore, while the collaborative and participatory nature of fieldwork research is emphasized as a basic criterion of good practice in almost all methodological literature on fieldwork, including language research, it may not always be clear who is representative of the "community," whose views should be consulted, whose voices heard, and whose agendas included in the research.

Related to this is the issue of research relationships. While exercising the position of expertise, authority, and power may be seen as inappropriate in Western notions of ethical practice, not assuming those positions in other contexts may be highly problematic and jeopardize the legitimacy of the project in the eyes of the community as well as threaten the researcher's reputation. Huss (2008) is well aware of the importance of outside experts in endangered language documentation projects, but stresses that in these important emancipation efforts, the initiative must come from inside the speech community rather than from the outside. Yet, this very point raises ethical concerns in situations where such initiatives are either not in evidence to start with or peter out as the research progresses.

Collecting and Analyzing Interactional Data: The Bilingual Turn in Second Language Acquisition Research

The native speaker (NS) versus non-native speaker (NNS) dichotomy and monolingualism as a norm have been problematized in many areas of applied linguistics (Cook, 1991; Firth & Wagner, 1997). For instance, we know from empirical evidence that a violation of NS pragmatic norms in NNS talk may not necessarily be an example of failure, as is often interpreted in traditional SLA research, but can reflect the L2 speakers' intentional use of L2 to convey emotions, such as anger and frustration (Dewaele, 2007) or that using languages alongside each other in bilingual classrooms can be a reflection of legitimate linguistic practices in which bilingual users engage to pursue a variety of social and functional goals (Creese & Blackledge, 2010).

Yet, while the need to account for the multilingual reality has been acknowledged in the field of SLA, Ortega (2010) has argued that this awareness has not been translated into

the actual SLA research practices of the collection and analysis of data. NS versus NNS sampling without any consideration to the speakers' "history of usage," excluding languages from SLA data and pervasively unilingual analyses of interaction which fail to capture the rich resources bilingual speakers draw on to convey meanings all continue to perpetuate the monolingual bias. This, Ortega has argued, is unethical because by hiding languages and adopting unhelpful labels, we inevitably construct L2 users as deficient, which is hurtful and must be redressed in the way we talk about SLA research, design it, and analyze the multilingual data it generates.

This is a significant and long-due shift in debates on ethical SLA research practice. At the same time, however, there is a need to acknowledge that recognizing multilingual realities and adopting a more positive discourse in our research does not necessarily make it immune from further potential ethical dilemmas. This is especially the case if our commitment to multilingualism is not shared by the research participants and conforming to a monolingual norm is seen by them as vital to the pursuit of their goals.

Consent and Representation: The Use of Digital Technologies for Recording and Studying Language Practices

The rapid development of digital technologies has opened up new research avenues and numerous possibilities for collecting insightful language data, be it on interaction, learner language, negotiation of social and virtual identities, literacy practices, and many others (see Chapelle, 2004). More accessible ways of capturing language interaction through audio and video recordings, including the increasingly widespread Web 2.0 tools offer virtually unlimited options for studying linguistic practices of diverse populations. Many scholars have also embraced the opportunities that the new technologies offer for sharing research results, enabling direct access to participants' authentic language and interaction (Shohamy, 2004) through videos, photos, podcasts, or blogs. With these opportunities come new responsibilities, however, and as Scollon and LeVine (2004, p. 5) warn,

The primary question now is not: Do we have or can we develop the technology needed to record the behavior of others? The primary question is: What rights does an academic researcher have in relationship to and in negotiation with her or his subjects of study?

Thus a whole new ethical landscape emerges where traditional ethical concerns such as informed consent, privacy, or anonymity have to be rethought in relation to virtual environments where different rules may apply.

For example, even when the research participants may have foregone their right to anonymity, does their consent always imply awareness of the full range of possible uses of the resulting multimodal data? And how far does the researcher's ethical responsibility extend in relation to how the research participants are represented? For instance, while swearing and all kinds of coarse vernacular language may be examples of authentic communication that the new technologies have increasingly made possible for researchers to access, does the participants' consent also include their agreement to be portrayed in an unfavorable light?

Another issue of representation has been raised by Jones (2004) with regard to the analysis of computer-mediated communication (CMC). As his account illustrates, people engage in CMC, such as instant messaging, for various purposes and goals and under a range of circumstances. Yet, the CMC research reports leave the readers with the impression of a virtual vacuum that bears no connection with the physical and psychological worlds that the people behind the computers inhabit as they produce the texts appearing on the screen. Representing those contexts more fully through multiple data collection

methods, rather than simply stopping at the screen edge and separating the virtual from the material world, is an important ethical challenge that language researchers in the 21st century face.

The Situated View of Ethical Research Practice

The above examples demonstrate that there is no ethical blueprint for language research and tensions and dilemmas can arise in the specific research contexts regardless of the methodological or epistemological approaches adopted by the researchers. This is because the above-mentioned principles of respect for persons, beneficence, and justice, but also others, such as inclusivity (Purvis, 2008) or empowerment (Cameron et al., 1994), are all grounded in a priori definitions of good practice. Drawing on the work outside of applied linguistics (Guillemin & Gillam, 2004; Haverkamp, 2005; Helgeland, 2005) and using examples from her research with English language teachers in Slovakia, Kubanyiova (2008) has shown that *ethically important moments* may arise in the course of specific research, for which these *macroethical* principles may hold ambiguous, contradictory, or no answers at all. She has therefore proposed a more situated approach to applied linguistics research involving humans, adopting two *microethical* frameworks for ethical decision making: *ethics of care* and *virtue ethics*.

The *ethics of care* model's underlying premise is that research is primarily a relational activity demanding the researcher's sensitivity to, and emotional identification and solidarity with, the people under study (Helgeland, 2005). However, rather than being given labels, such as "vulnerable" or "marginalized" persons who require the kind of protection set out in the macroethical principles, the research participants are seen as "specific individuals, located in specific situations that require actions based in care, responsibility, and responsiveness to context" (Haverkamp, 2005, pp. 149–50).

Virtue ethics theory, on the other hand, originates in Aristotelian ethics and stresses the researcher's ability to recognize microethical dilemmas as they arise in the concrete research practice (Haverkamp, 2005). It does not place an emphasis on following principles but rather on the development of the moral character of the researcher, their ability, and willingness to discern situations with potential ethical ramifications as they arise in the research practice, and their ability to make decisions that are informed by both *macroethics of principles* and *microethics of care*. The researcher's reflexivity is an indispensable tool in pursuing ethical decisions, which facilitates the understanding of both the nature of research ethics and how ethical practice can be achieved (Guillemin & Gillam, 2004).

While some ethical codes of practice (e.g., BAAL, 2006) have started to recognize the situated nature of ethics, few provide specific guidance for situations in which macro- and microethical concerns clash. One exception is the *Canadian Code of Ethics for Psychologists* (CPA, 2000), which integrates macro- and microperspectives of ethical research practice, recognizes the complexity of ethical decision making and the need to establish a hierarchy where different core principles conflict, and concedes that firm prioritizing will not always be possible and that ethical decisions in those instances will have to be a matter of the researcher's personal conscience.

Conclusion

The examples in this overview have shown that what is ethical research practice in language and interaction research needs to be constantly negotiated and renegotiated in the context of the specific research project. While it is critical for the field of applied linguistics to continue to reflect on the macroethical principles, it is also important to

acknowledge sensitivity to ethically important moments at the microlevel as one of the key responsibilities of language and interaction researchers (Kubanyiova, 2008). This approach to ethical decision making resonates with Hornberger's (2006) view that in order to advance our understanding, we must approach our research with humility and respect for both communities and individuals, and is in full agreement with the latest theorizing in applied linguistics research, namely complexity theory, which

in connecting local and the global, keeps active what is specific about individuals and their actions. Since each action or decision has the power to affect all that it is connected to, our ethics must apply at that local level. Ethical responsibility is thereby placed on agents and actors in complex systems, as we hold that we all are, and is to be applied to all actions and decisions, in the language classroom as elsewhere. (Larsen-Freeman & Cameron, 2008, p. 226)

Ethics in Language Assessment

LYNDA TAYLOR

Introduction

The term “ethics” normally refers to a set of accepted beliefs and practices intended to constrain behavior and to promote the common good. In Western society at least, the second half of the 20th century was characterized by a quest for social ethics. Alan Davies, a leading academic in the field of ethics in language assessment, highlights work by Rawls (1972) and Gauthier (1986) in the development of contemporary social ethics (Davies, 2004). Echoing Rousseau (1762/2004) two centuries earlier, they endorsed the notion of “a social contract” according to which rules constraining individual and institutional behavior are accepted as part of the social cooperation needed to achieve advantages and benefits for all.

An Explicit Social Ethics in Language Assessment

Since the early 1990s there has been particular interest in and debate over the ethics of language assessment, both within the language testing community and beyond. This does not imply a previous lack of concern about ethical practice in assessment, nor a tendency on the part of language testers to behave in unethical ways. Ethics in language testing has been embodied in traditional concerns for test validity and reliability, and language testers have always acknowledged the important, often high-stakes, role played by language tests, with their potential to influence people’s life choices in education and employment. In light of this, strenuous efforts were made to ensure fairness in language tests and the use of test scores. In the 1990s, however, language testers sensed a need to articulate the ethics of their field more explicitly, for themselves and wider society. Several factors contributed to this development.

The latter part of the 20th century saw an upsurge of interest in ethics generally, illustrated by frequent attachment of the word “ethical” to spheres of public life, for example *ethical foreign policy*, *ethical trading*. The world of language assessment was not immune from this trend, sometimes perceived as a mark of the postmodern age. At the same time, organizational bodies and work domains underwent a process of increasing professionalization and this involved them in developing their own domain-specific codes of ethics and guidelines for good practice (Davies, 2004). For the emerging language testing profession, these trends coincided with a deepening understanding of the complex influence of assessment in language education and in wider society. Discussions about test washback and impact gathered pace during the late 1990s and early 2000s reflecting growing awareness of the consequences of testing, intended and unintended, positive and negative. This paved the way for in-depth exploration and analysis of the sociopolitical dimensions of language assessment, with some expressing concern over the potentially unethical use of tests as instruments of power and social control. Traditional assumptions about the balance and exercise of power within the language assessment context began to be challenged, partly stimulated by the application of critical theory in academic studies (Shohamy, 2001). There was increasing recognition of the wide range of stakeholders, both individual and

institutional, who are involved in language assessment, and the perspectives of test takers and other stakeholders in the testing enterprise were more actively sought and integrated into testing practices (Taylor, 2000; Mathew, 2004). Changes in discrimination legislation and developments in English language pedagogy worldwide meant that greater attention was focused on meeting the specific needs of growing test-taker populations seeking access to assessment opportunities, for example test-takers with disabilities, and young language learners. In addition, scrutiny focused upon the responsibilities of institutional test providers, and demands for both appropriate structures of accountability and systems of quality assurance were addressed (Van Avermaet, Kuijper, & Saville, 2004). Finally, advances in measurement theory and practice (e.g., expanded concepts of validity, new analytical techniques, computer-based testing) prompted consideration of ethical questions and challenges arising out of academic research and new technologies.

Influenced by the growing professionalization of social practices, a strong ethical milieu thus emerged for language testers towards the close of the 20th century. During the 1990s and 2000s, the field responded by steadily professionalizing itself, and by developing explicit values and standards for its beliefs and behavior as a community. This was largely achieved through systematic and sustained debate of ethical issues and questions in professional journals and at academic conferences. An early symposium on the ethics of language testing was held during the 1996 meeting of the Association Internationale de Linguistique Appliquée (AILA) in Finland, leading to a special issue of the journal *Language Testing* on this theme in 1997. The same year the international language testing community's annual conference, the Language Testing Research Colloquium (LTRC), took as its theme "Fairness in language testing," reflecting the growing focus on matters of test standards, test bias, equity, and ethics for testing professionals (Kunnan, 2000). Two years later, LTRC 1999 included a symposium entitled "Rights and responsibilities of testers and test takers in language testing settings: ethics, policy, practice and research." In 2002 a language assessment ethics conference was specially convened and this led in 2004 to a special issue of the newly established international language testing journal *Language Assessment Quarterly* entitled "The ethics of language assessment." In little more than a decade, therefore, the subdiscipline of ethics in language assessment had become well established within the professional language testing community. The professional ethics of the field of language assessment continue to evolve, informed by the wider literature in ethics and moral philosophy (Kunnan, 2008).

Professional Associations, Codes of Ethics, and Codes of Practice

Concern to establish ethical values and to ensure responsible professional practice in language assessment contributed to the creation of language testing associations around the world. Among the earliest were the Association of Language Testers in Europe (ALTE) in 1990, a consortium of institutional language test providers in the European arena, and the International Language Testing Association (ILTA) in 1992, an association for individual (and later institutional) members. There followed other national and regional professional associations such as the Japan Language Testing Association (JLTA) and the European Association for Language Testing and Assessment (EALTA).

All these organizations established committees or subgroups tasked with drafting and developing quality standards, ethical codes, and professional guidelines for their associations, in the expectation that such statements would help promote socially and ethically responsible behavior among their members, and could be used to communicate to others the fundamental principles and processes underpinning responsible test development and use. The drafting process built upon earlier work undertaken by the Joint Committee on

Testing Practices in the USA to produce *The Code of Fair Testing Practices in Education* (1988, 2004) and the AERA/APA/NCME *Standards for Educational and Psychological Testing* (1999) which set out technical, industry standards for test development, production, and delivery; the new professional codes for language assessment, however, addressed matters extending well beyond a test's technical qualities. A key aspiration was to ensure that test washback onto the learning curriculum and classroom and the impact of test use in wider education and society would be as positive and beneficial as possible. Examples of such professional codes include the ALTE *Code of Practice* (1994), the ILTA *Code of Ethics* (2000), the EALTA *Guidelines for Good Practice* (2006) and the ILTA *Guidelines for Practice* (2007).

A broad theoretical distinction can be drawn between a *code of ethics* and a *code of practice*. A *code of ethics* typically articulates a set of universal and foundational principles, sometimes amplified with a series of annotations for clarification or elaboration. A *code of practice* usually seeks to instantiate these high-level principles in some detail, and it may reflect the requirements of local practice and the demands of particular cultures. In practice, however, this distinction is not always as clear-cut as either the theory or the labels would suggest: some codes of practice tend to read more like a code of ethics, and what are essentially codes of practice are often instead labelled "guidelines for (good) practice."

The ILTA *Code of Ethics* derives from the universal principles of "beneficence, non-maleficence, justice, a respect for autonomy and for civil society." The ILTA *Code of Ethics* (ILTA, 2000) is partnered by separate ILTA *Guidelines for Practice* (ILTA, 2007) on the grounds that, while the *Code of Ethics* focuses on the morals and ideals of the profession, the *Guidelines for Practice* identify the minimum requirements for practice in the profession and focus on the clarification of professional misconduct and unprofessional conduct. Both codes were drafted by an ethical subcommittee appointed by the ILTA executive board, then reviewed and discussed by the association's membership, before being approved at the association's annual conference. ILTA recognizes that the codes need to be responsive to needs within the profession and that, in time, both codes will require revision in response to changes in language testing and society.

Davies (2004) and Thrasher (2004) highlight the complex relationship between a code of ethics and a code of practice. They discuss the difficulty of moving from a set of universal, high-level principles, based upon the golden rule of "do no harm," to a document which aims to spell out in practical terms what language testers should and should not do in their day-to-day work. Developing such a code of practice presents various dilemmas, especially at an international level.

First, the contexts around the world where language assessment takes place vary considerably; standards or practices which it is realistic to expect or demand in one context may be unrealistic or unreasonable in another. While a code of ethics may achieve universality, codes of practice tend to require cross-cultural interpretations. Nonetheless, Thrasher (2004) demonstrates how a universal code of ethics formed a valuable backdrop to the development of a workable code of practice in a particular situational context, language testing in Japan, helping to inform and justify the rules that went into it.

Second, codes of ethics, and particularly codes of practice, raise the issue of what should happen if individuals or institutions contravene the principles or good practices enshrined in ethical codes. Davies (2004) notes the subtle tendency for ethical frameworks to become legalistic (over time) and warns that they can become mere ritualized window dressing. The language testing community has for several years debated how and by whom the profession should be "policed" and what penalties or sanctions could be imposed upon those who fail to uphold the code. Failure to uphold the ILTA code of ethics risks withdrawal of membership. Some argue for a stronger policing role for the professional associations, especially with regard to institutional test providers. Others advocate an alternative approach in which quality management systems are established as a means of

improving and guaranteeing standards. Van Avermaet et al. (2004) discuss a framework involving an ethical code, a set of minimum standards, and a process of self-assessment and external auditing, which together enable a continuous process of self-evaluation and quality improvement that takes account of issues of contextualization and diversity.

Finally, there remains a question over how far language testers can be held ethically responsible, in any absolute sense, for uses to which their tests are put, especially when such decisions lie far beyond their control.

Accommodations in Language Assessment

One important area for ethical consideration in language assessment has been the extent to which the particular needs of candidates in certain minority groups or with special requirements are acknowledged and properly addressed. This has become an important measure of the social responsibility or ethical standing of any language test provider and the principle applies whether the test provider is an individual classroom teacher devising a local test for her own students or an examination board offering high-stakes international tests on a large scale. Test takers with disabilities, whether temporary or permanent, constitute one such significant group in education and civic life. Educational, employment, and social opportunities for people with disabilities have increased steadily over recent years. Combined with a greater awareness of individual human rights and associated legislation, this has led to increased demand for access to testing and assessment provision. Language test providers routinely need to be able to offer special arrangements for test takers with visual, hearing, or other physical impairments, or learning difficulties. Providing such arrangements typically involves departing from established testing protocol, modifying test content, format, or administration so as to minimize the impact of those test taker attributes that are irrelevant to the ability construct being measured. For example, a test taker with a broken wrist is likely to need the assistance of a scribe to record her listening test answers or to complete the writing part of the test. Similarly, a visually impaired candidate may need a specially prepared braille or enlarged print version of a reading test for him to demonstrate his reading ability. Such special arrangements are typically referred to as test “accommodation(s),” “modifications,” or “adaptations”; they are made in the interests of fairness and equity so that, as far as possible, the test taker can take the test on an equal footing with other candidates.

Most of the published research relating to accommodations in language assessment has been conducted in the USA with English-language learners (ELLs) who are typically immigrants and indigenous groups in school-based learning and assessment contexts (see Abedi, 2008). Much of this research focuses on the language of instruction, though some studies have investigated the effectiveness and validity of accommodations for language learners with disabilities. Studies of this nature can be difficult to design, carry out, and interpret, and findings can be contradictory or inconclusive. It is not surprising, therefore, that decisions about the nature and extent of modification to language test content and delivery often tend to be based upon professional judgment informed by ethical values and practical considerations. More research, both theoretical and empirical, is needed among test-takers with disabilities to inform language testers’ policy and practice in this area, especially with regard to the effectiveness and validity of accommodated tests. Ethical considerations pertain equally to the interpretation and use of scores from accommodated tests since adaptations to test content, format, and delivery risk changing the ability construct, and thus the meaning of the test scores. Taking an equally ethical view, it is important that sufficient and relevant information about test score meaning is properly communicated

to test users (such as university admissions officers or employers) who will have to interpret and make decisions based on test outcomes. In some cases, it may be appropriate to add an endorsement (or “flag”) to a test taker’s certificate, indicating that some objectives of the test could not be assessed due to the candidate’s disability in some respect. However, this approach raises other ethical issues and needs careful handling to ensure that it does not unduly or unfairly label test takers as having taken a modified test and thus lead to them suffering subsequent discrimination. The example of language test provision for test-takers with disabilities conveniently highlights the complex challenges that can confront language testers as they seek to work out in practice a commitment to behaving ethically.

Developing Assessment Literacy in the Public Domain

The development of standards, ethical codes, and guidelines for good practice has to some degree made the business of designing and developing language tests more transparent and accessible. However, it also risks promoting a view of language testing as technical and specialized, best left to professional experts properly qualified to attain industry standards. This has ethical implications for nonspecialists who find themselves increasingly involved, either directly (e.g., classroom teachers, university lecturers) or indirectly (e.g., college admissions officers, immigration officials, parents), in producing and using tests and test scores. Such stakeholders may be keen to improve their assessment knowledge and skills, but they may feel discouraged from doing so by perceptions of the field’s growing professionalization. Both Davies (2008) and Spolsky (2008) express concern that the process of professionalization over the last 25 years has isolated the language testing field from other academic disciplines, including applied linguistics and fellow social sciences. This may be equally true for the profession’s relationship with the wider world of education and society. One might speculate that the language testing community’s preoccupation with technical and measurement qualities in testing from the 1960s to the 1980s, followed by a focus on developing its own professional ethic during the 1990s, means it has failed to encourage wider public understanding of assessment principles and practices, including the ethical dimensions of assessment.

Assessment literacy is crucial in a world where the testing of language skills (for a second, third or additional language) has moved from periphery to centre stage. Language tests, and the scores they generate, are increasingly used across contemporary society worldwide: within education, from primary age to higher education; in employment contexts, from the professional registration of health professionals to health and safety issues in the catering or construction industry; and, more controversially, in migration and citizenship policy and practice around the world. Spolsky observes that “testing has become big business” (Spolsky, 2008, p. 297), not simply in commercial terms; Shohamy notes “the societal role that language tests play, the power that they hold, and their central functions in education, politics and society” (2008, p. xiv). There are not just more people taking tests; growing numbers are directly involved in selecting or developing tests, in using test scores for decision-making purposes, or both. Thus language assessment continues to raise important ethical issues and challenges not only for the profession but for society as a whole; and language testers have a continuing duty to promote assessment literacy within their professional community and beyond in pursuit of ethical testing practice.

Ethics in Research

NARIYO KONO

In earlier volumes of applied linguistics (Kaplan, 2002; Davies and Elder, 2004) ethics was included as part of the definition and history of research in applied linguistics. As the discipline of applied linguistics research flourishes and applied linguists make strides towards “the resolution of language-based problems in the real world” (Grabe, 2002, p. 12), its growth has brought to light the natural consequence of research: how we can effectively and ethically conduct our research so that we can make contributions to others and society.

Different aspects of ethics should be considered, depending on the goals or phases of each project. For example, qualitative research projects may pay close attention to the development of good relationships between the researcher and participants (due to the demands of nurturing a close or long-term relationship). In comparison, quantitative-focused researchers may be more concerned about how they initiate contact with their participants and avoid misunderstandings that can arise from irregular communication. Researchers who employ both methodologies or combine various techniques will have to cope with what arises from all aspects of their project and its goals. Further, if we consider the relationship between qualitative and quantitative research methods as a natural continuum, rather than an artificial dichotomy, we begin to see that each gradation of that continuum represents a different set of ethical questions. And in the face of this complexity, looking at ethics in a broader context can give us tools to approach these issues and help us make better decisions.

This entry will follow critical developments of ethics in roughly chronological order. It begins with the history of the human subject, examines how ethical aspects came to be included in research, continues by examining ethical principles, and covers some related policies. It then moves into relevant theories of ethics and uses this theory exploration to unlock some of the complexities embedded in this subject. Finally it highlights some research situations that require special attention as part of the application of ethical issues in applied linguistics. This entry is intended to provide overall ethical guidance that applies to qualitative, quantitative, or the combination of both approaches. Some sections may apply more strongly to one type of research than another, so researchers can apply the most appropriate lessons to ethical choices they have to make in their own research.

History of the Human Participant

According to Dunn and Pharm (2001), there are three main historical events that led the USA to create ethical standards in biomedical and behavioral research: the Nuremberg doctors’ trial of 1946, the 1960s thalidomide tragedy, and the Tuskegee syphilis study exposé of 1972. In all of these tragic cases, the participants were the victims of medical experiments and were not given what was needed to make a fully informed choice. In some cases they were even forced to be part of the experiment regardless of the fact that potential risk or harm was predicted before the experiment began. The National Research Act was passed in 1974 and required regulations for protecting human participants by implementing informed consent and regular review of research by institutional review boards (IRBs). The US government established the National Commission for the Protection

The Encyclopedia of Applied Linguistics, Edited by Carol A. Chapelle.

DOI: 10.1002/9781405198431.wbeal0395

of Human Subjects of Biomedical and Behavioral Research as part of that Act, and the commission wrote the Belmont Report to identify ethical principles and develop guidelines accordingly (National Commission, 1979). The *human subject (or participant)* is defined as “a living individual about whom an investigator (whether professional or student) conducting research obtains: a) data through intervention or interaction with the individual; or b) identifiable private information” (Department of Health and Human Services, 2009). Research institutions in the USA are required to form a review committee, to register that body as the official IRB with the Federal Office of Human Research Protections, and to publicly post their own policies in adherence with the federal code of regulations.

Basic Ethical Principles

There are three basic ethical principles outlined to protect persons who participate in research in the USA (National Commission, 1979): autonomy, beneficence, and justice. The Belmont Report addressed moral requirements and applications based on these principles.

Autonomy is defined as respect for persons, encompassing two moral imperatives: “first, that individuals should be treated as autonomous agents, and second, that persons with diminished autonomy should be entitled to protection” (National Commission, 1979, p. 5). As a consequence, *informed consent* is a mechanism that guards autonomy: first by making potential participants fully aware of the research, and second by protecting their choice of participation. The autonomy of all individuals is to be protected, which means that special consideration must be given to those whose capability of self-determination is disadvantaged for any reason (including immaturity, debilitating illnesses, or physical handicaps). This means acquiring permission from a child’s parent or guardian or soliciting consent from a trusted caretaker of the handicapped, for example. There are three components that every consent form should contain: information, comprehension, and voluntariness. Informed consent also should be considered as a “process of information exchange” between researchers and participants “before, during and sometimes after the study” (Dunn and Pharm, 2001, p. 21).

Beneficence is another important principle that the National Commission endorses. The principle entails first doing no harm to the research participants, and second maximizing the benefit to them while minimizing possible harms (National Commission, 1979, p. 6). Researchers are required to assess the full risks and benefits that their research project presents to the participants. It is the researchers’ responsibility to assure that their research will be valuable and not harmful to all persons involved.

The last principle is *justice*. The National Commission emphasizes fairness of participant selection: that participants should be selected based on their relevance to the research rather than convenience in order to avoid manipulation of the study. Researchers are required to assess fairness of participant selection and procedures.

Types of Categories of Research

According to the Code of Federal Regulations, written by the Department of Health and Human Services (DHHS), research is defined as “any systematic investigation designed to develop or contribute to generalizable knowledge” and is categorized by three types of review statuses (DHHS, 2009). Most social science or educational research (compared to studies involving medical treatments) is assumed to present little risk to the participants, but protecting the rights of participants in such studies cannot be ignored. The level of risks to participants is a determining factor as to which research category a project is assigned: *exempt (waived)*, *expedited*, or *full review*. Researchers are required to file their

applications with IRBs, who review the applications at the institutional level, even in cases the researcher considers exempt. Following is a list of some of the categories that are applicable to research in applied linguistics (though there are additional regulations not covered here) that would apply to other science fields (e.g., biology, clinical practices). For the complete set of regulations, see the Code of Federal Regulations: Title 45 Public Welfare revised January 15, 2009, effective July 14, 2009 (DHHS, 2009).

Exempt (Waived) Review

Many survey, interviews, and public observation studies in the USA are exempt under revised federal regulations, and the IRB will consider a waiver of review for the following:

1. Research conducted in established or commonly accepted educational settings, involving normal educational practices, such as: (a) research on regular and special education instructional strategies, and (b) research on the effectiveness of or the comparison among instructional techniques, curricula, or classroom management methods.
2. Research involving the use of educational tests (cognitive, diagnostic, aptitude, achievement), survey procedures, interview procedures, or observations of public behavior, unless: (a) information obtained is recorded in such a manner that human subjects can be identified, directly or through identifiers linked to the subjects; or (b) any disclosure of the human subjects' responses outside the research could reasonably place these subjects at risk of criminal or civil liability or be damaging to the subjects' financial standing, employability, or reputation.
3. Research involving the use of educational tests (cognitive, diagnostic, aptitude, achievement), survey procedures, interview procedures, or observation of public behavior that is not exempt under exemption 2 above if: (a) the human subjects are elected or appointed public officials or candidates for public office, or (b) federal statutes require without exception that the confidentiality of the personally identifiable information will be maintained throughout the research and thereafter.
4. Research involving the collection or study of existing data, documents, records, pathological specimens, or diagnostic specimens, if these sources are publicly available or if the information is recorded by the investigator in such a manner that subjects cannot be identified, directly or through identifiers linked to the subjects. Secondary data that has identifiers falls under this waiver.
5. Research and demonstration projects which are conducted by or subject to the approval of department or agency heads, and which are designed to study, evaluate, or otherwise examine: (a) public benefit or service programs, (b) procedures for obtaining benefits or services under those programs, (c) possible changes in or alternatives to those programs or procedures, or (d) possible changes in methods or levels of payment for benefits or services under those programs (DHHS, 2009).

Expedited Review

If the research activities involve only *minimal risk* and belong to one of the following categories, the study proposals will be eligible for expedited review procedures. These procedures do not require a convened committee meeting, which affords them a shorter review process. Minimal risk is defined as

the probability that the magnitude of harm or discomfort anticipated in the proposed research is no greater in and of itself than those ordinarily encountered in everyday life, or during the performance of routine physical or psychological examinations or tests. (DHHS, 2009).

4 ETHICS IN RESEARCH

This review procedure may also apply to research proposals that represent minor changes to projects that received approval within the prior 12 months.

1. Research involving materials (data, documents, records, or specimens) that have been collected, or will be collected solely for nonresearch purposes (such as medical treatment or diagnosis). (Note: Some research in this category may be exempt from the DHHS regulations for the protection of human subjects, 45 CFR 46.101(b) (4). This listing refers only to research that is not exempt.)
2. Collection of data from voice, video, digital, or image recordings made for research purposes.
3. Research on individual or group characteristics or behavior (including, but not limited to, research on perception, cognition, motivation, identity, language, communication, cultural beliefs or practices, and social behavior) or research employing survey, interview, oral history, focus group, program evaluation, human factors evaluation, or quality assurance methodologies (DHHS, 2009).

Full Review

If the research involves greater than minimal risk or involves special populations (*vulnerable participants*), it requires a full review by the IRB. Vulnerable participants refers to “Group/individual that cannot give informed consent because of limited autonomy (e.g., children, mentally ill, prisoners)” and also to participants “who may be unduly influenced to participate (e.g., students, subordinates and patients)” (Dunn & Pharm, 2001, p. 224).

Extensions of IRB

Many institutions and professional organizations have developed procedures guarding ethical principles. In the USA and Canada, the review of research by IRBs, obtaining informed consent, and institutional assurances of compliance are the three mechanisms to protect human participants. In the field of applied linguistics, these federal regulations are also applied to our research at individual and institutional levels, even though most research projects in the applied linguistics field do not pose the same sense of risk as medical studies. Both the American Psychological Association (APA) and Canadian Psychological Association (CPA) have outlined ethical principles regarding the code of conduct of psychologists (CPA, 2000; APA, 2010). These were developed for psychological practice and as such recognize even the subtlest impact our interactions can have on others. On the topic of justice, for example, the National Commission focused solely on fairness in selection of participants, whereas APA’s code of ethics states not only equal access to psychology, but equal quality through all processes, procedures, and services (APA, 2010). These codes of ethics provide practical guidance that can be applied well beyond the field of psychology. For additional reference, see guidelines or codes developed for specific fields or other countries, including those developed by the American Educational Research Association (AERA, 2005), the Linguistic Society of America (LSA, 2009), and the Australian Institute for Aboriginal and Torres Strait Islander Studies (AIATSIS, 2011).

Theories of Research Ethics

Several scholars have contributed to the development of theories on research ethics, where *theories* refer to ideological orientations, while *guidelines* refer to practical directional guides. The subjective value of theories, by their very nature, is a debate unto itself. For completeness, some of the applicable and best known theories are highlighted here. To begin a

journey through ethics theories, the contribution of two sociolinguists will be inspected: Labov's two principles and the follow-on work of Wolfram's ethical theory proposal (Labov, 1982; Wolfram, 1993). And, though from a different field, Thomas's (1996) exploration of several theories will help form a solid foundation for the survey of theories on ethics. Tying things together, Kubanyiova's (2008) examination of theories is a recent contribution to this field. Finally, the ecological perspective of research ethics is proposed as an integration of some of these theories.

Labov (1982) suggested that scientists have the responsibility to prevent error, where error is defined as "a widespread idea or social practice with important consequences that is invalidated by his own data" (Labov, 1982, p. 172). Labov calls this the *principle of error correction*. Labov's second theory is called the *principle of debt incurred*, which is explained as linguists' ethical responsibilities to use the linguistics information gathered from a speech community for the benefit of the community when it is needed.

Wolfram (1993) proposed a third principle, called the *principle of linguistic gratuity*, defined as "Investigators who have obtained linguistic data from members of a speech community should actively pursue positive ways in which they can return linguistics favors to the community" (p. 227). It is quite common in linguistic studies that researchers (especially those who are not members of the community in which the research is centered) will learn about the language and culture related to the project, whether they are documenting an endangered language, studying cultural learning methods, or teaching a second language. This learning is generally required in order to fulfill the purpose of the study, but Wolfram's final principle gives the direction that researchers should use this knowledge to return something of value to the place and people of research.

The next three frameworks are explained by Thomas (1996) as: (a) *deontological*, (b) *teleological* (or *consequential*), and (c) *postmodernist* (or *dialogic*). He focused on the first two frameworks in his work in 1996, and noted that the third perspective is comparatively rare. The first framework can be described as rule-based, where causes are judged and prescribe an action. His second theory, teleological, suggests decisions are made based on the judgment of their outcomes. He described this as a: "perspective, associated with, but not exclusive to, utilitarianism, [which] operates from the premise that ethical behavior is determined by the consequences of an act" (p. 109). His third suggested theory, dubbed postmodernist or dialogic, sees ethics emerging out of natural dialogue rather than from rules or firm guidelines.

Thomas's theory development shows why people who clearly have a moral compass and systematic approach to ethical issues can still have different perspectives. Each research project involves a range of ethical scenarios, and each scenario might benefit from a different tactical approach to resolving ethical dilemmas. Not surprisingly, ethics is part of every encounter or exchange with another person or group. Being able to adapt theories and apply guidelines to diverse situations is a vital talent for successful researchers.

In addition to the ethical protocols set forth by each field and the theories developed to better understand the motivations behind them, there is another dimension to ethics coined by Guillemin and Gillam (2004): *macroethics* and *microethics*. Kubanyiova (2008) argued that the growing situated research in applied linguistics necessitates a more contextual approach to ethical needs (*microethics*), as compared to the more general and standardized procedures defined by IRB (*macroethics*). Drawing on her own classroom research experiences, Kubanyiova describes many sensitive situations, so-called *ethical tensions*, where researchers need to be cognizant of the significance of their own person in a research scenario. As an example, she observed a case where a teacher-participant had to face embarrassment or psychological pain during an interview session where the participant was invited to reflect on the instructor's teaching. Even though the macrolevel of ethical safeguard guarantees voluntariness of research participants, some power relationships

may still exist that inhibit refusal or participation. More examples of circumstances that implicitly inhibit that which protocols aim to protect are: a colleague of the researcher is invited to participate, a student of the researcher is asked to participate, or a family relation is a study subject. Kubanyiova considers these “unethical at the micro-level” (2008, p. 510). Kubanyiova further suggests an integrated approach by promoting the “symbiotic relationship between macroethics and microethics” (p. 507). A summary of her main points is:

- integration of macroperspectives and microperspectives of ethical research practice,
- acknowledgement that principles may conflict and may therefore need to be balanced in ethical decision making,
- acknowledgement of the potentially complex process of ethical decision making,
- admission that the complexity of dilemmas in qualitative research precludes firm prioritizing of principles. (p. 507)

Researcher awareness of ethical aspects of research has increased in recent literature. We need to continue to collaborate in meaningful discussions, share new examples, and develop guidelines on both theoretical and practical levels, especially for situated research. The survey of theories covered here can serve as a useful reference and an elicitation of future discussions on this complex and important issue.

Applications in Applied Linguistics

In her article on qualitative theory and methods in applied linguistics, Davis (1995) reviewed research trends in second language and acquisition and identified psychology, linguistic anthropology, and education as prominent disciplines that have influenced (or have been influenced by) applied linguists. Davis warned of some ethical dilemmas that researchers might encounter in the field and power relationships that might exist in research settings.

The exploration of ethical concerns in field literature is traditionally scarce, according to several critics in the field (Nunan, 1997; Corrigan, 2002; Dörnyei, 2007). But recent research methodology publications have begun to dedicate sections to ethical concerns (Dörnyei, 2007; Paltridge & Phakiti, 2010). Dörnyei’s book included a chapter on quality criteria, research ethics, and other research issues in applied linguistics with an emphasis on the ethical aspects of research. He also warned us not to “simply import ethical guidelines from other fields” (p. 71).

Dörnyei (2007) assumes that the relationships between researchers and participants in qualitative studies might present unique obstacles due to the constantly evolving nature of such research processes. He included some examples of how to develop and maintain balanced relationships with participants as well as how to end the project without leaving participants feeling used. He calls these *ethically relevant moments* (p. 67) and stresses that ethical frameworks need to be “more participant- than researcher-friendly” (p. 64).

The recent research methods book in applied linguistics by Paltridge and Phakiti (2010) presents more ethical considerations in a systematic way by offering an ethical consideration section in several chapters. One of the chapter authors also advises that researchers guard against unfair elimination of participants that arises out of purely statistical processes, suggesting that selection should be made with the human dimension in mind. She also includes an example of an ethical dilemma on equal treatment:

As researchers design studies, there is often a control group against which to measure the effects of a particular treatment. But, here too, there is an ethical question. If we have reason to believe that our treatment is beneficial, then we have recruited volunteers who will not receive the treatment. (Gass, 2010, p. 16)

According to Dörnyei (2007), there are eight areas where applied linguists might face particular challenges in the educational setting: the amount of shared information, relationships between researchers and participants, data collection methods, anonymity, handling collected data, ownership of data, sensitive information, and testing (p. 65).

These are application examples included in the general research methodologies. The final section below will introduce some of special cases for situational research ethics including cyberspace, international research, collaborative research, and endangered languages research.

Special Cases for Situational Research Ethics

There are many discussions, as well as some case studies, on research ethics in the emerging research arena of computer-mediated research or research in cyberspace. Some problem cases have been reported, and further guideline development is underway (Boehlefeld, 1996; King, 1996; Reid, 1996; Frankel & Siang, 1999). Cyberspace challenges some of the basic assumptions society has made about boundaries, but more importantly has blurred the distinction between private and public. Consequently, some new research methods, which mine data from chat rooms or study social networking postings, call for even newer microethical guidelines in order to protect the participants' privacy. King (1996) encourages us to think beyond the stereotypes of private/public perceptions on the internet: "While it is true that the newness of this phenomenon and the transitory nature of many cyberspaces makes assuming details about others hazardous, basic human nature remains unchanged. People are protective of their sense of privacy" (p. 199). The analysis of and reporting on study data must be done carefully. This is even more problematic as conventional protocols of the IRB exempt cyberspace-based research due to its stereotyped public nature; researchers must take care to approach this with all the same ethical principles already outlined. Reid (1996) discussed the issue of informed consent in the study of online communities and suggests that the researcher should "negotiate the potential consequences of our [researchers'] desire to pursue and create knowledge" (p. 6).

Some other cases, such as international research, also require extra attention regarding legal procedures (including copyright issues or foreign institutional requirements). Current regulations are not imposed on international scholars who are hosted in the USA, relying on the policies of their home institutions. What are the ethical implications, for example, when international scholars perform field research in indigenous communities but are exempt from the macroethical policies (e.g., informed consent or IRBs) of the hosting institution due to international status?

Eades (2010) introduces examples of complex situated research topics that require legal attention, including sociolinguistic analyses in court hearings and police interviews. These situations present unique ethical complications, such as the use of interpreters, involvement of hearing-impaired people, people who are immature or developmentally disabled, lawyer-client relationships, and varieties of speakers' languages (dialects, creoles). These situations can be delicate and require a firm grasp of microethics.

Another case for special attention is collaborative research or community-based research, which requires partnership with other sectors, such as industry, academic institutions, government entities, or other language communities. In collaborative research, we have to integrate the perspectives of multiple researchers. This means the research agenda, methodologies, and research processes all must be cooperatively negotiated between the partners' institutional and individual ethical perspectives. Many cases of collaborative research might produce challenging situations or ethical dilemmas to which the research team must respond.

In the emerging field of endangered language maintenance and revitalization (including language documentation), there are frequently even more ethical concerns that researchers face through the complete life of their research (and even beyond it). *Language ownership* is one of the central factors that motivate (and potentially also discourage) participants in maintenance or revitalization of their languages. Some of the ethical challenges researchers face here are: How do participants share their language with researchers? How do researchers protect the participants' language rights, which might be something beyond the normal purview of the researcher's training? If the participants wish their languages to be documented yet remain private, how can researchers be rewarded (rather than punished) in their scholarly career without publishing research results? What research method or paradigm can or should researchers select when the language faces endangerment?

Crowley (2007) suggests that researchers be aware of the power struggle between language speakers and language specialists, questioning to what degree the researcher can claim ownership of community or language knowledge. Such power struggles are diverse and often implicit, and include conflicts such as community versus academic, mainstream society versus indigenous society, and insiders' versus outsiders' perspectives. Nathan (2010) raises the issue of "access and usage rights" (Austin, 2010, p. 8). He offers a detailed deposit form and web-based access to a language archive system, so that community members can define access controls. This is one approach to preventing coercion and protecting the confidentiality of sensitive language materials, which come with strict familial or community guardianship.

When dealing with communities of different cultural backgrounds, the researcher will have to first absorb and learn the participants' viewpoints through an intercultural lens. The research itself should be negotiated with the participants so the research outcomes are mutually beneficial. Existing institutional ethical guidelines will help guide researchers in designing their research, but even more may be needed when working with endangered language communities, for example. In that setting, researchers require intercultural and communicative competence in order to gain the necessary trust, which will become central in their fieldwork.

Conclusion

Research practices must embrace macroethical structures as well as apply constant detailed ethical attention in order to progress our research in applied linguistics. Moreover, our definitions of research ethics are shaped through cultural, personal, and societal lenses. Riley (2004) argues that most judicial systems set up along the Western model do not have adequate mechanisms for handling indigenous intellectual property rights, which value communally held knowledge rather than strict individual or corporate rights. The more we wish to enrich our applied linguistics research and to contribute to our own (and others') societies, the more we see the need for solid ethical research foundations in order to properly serve our local and global communities. We should build on existing theories, utilize all the available guidelines, and engage in continuous dialogue with colleagues and participants. Through this *ecological approach*, we will deepen and broaden our perspectives on research ethics in applied linguistics.

Ethnicity

LISE PAULSEN GALAL

Ethnicity is a concept denoting difference. In order to hold a particular ethnicity, a person or a number of persons are defined as belonging to a particular ethnic group. Many researchers agree that ethnic groups have to be understood as imagined communities and discursive formations through which differences are accorded social significance (Hall, 1992; Bauman, 1996; Jenkins, 1997; Bulmer & Solomos, 1999; Barker & Galasinski, 2001). However, what constitutes ethnic difference? Not only do the kinds of differences ascribed significance vary between different ethnic groups, but also the basis for understanding ethnicity as a social force produces conflicting perspectives. If the difference of significance for one group is language, for another religion, for a third territorial autonomy, what then is ethnicity? And what makes the difference socially significant? Is it political ambitions, primordial lineage, or historical heritage? Different disciplines and different scholarly traditions have had different answers to these questions. In order to identify the most prevalent uses of the term, three main perspectives or discussions on ethnicity will be presented. Inspired by Brubaker (2004), one way to distinguish between different approaches to the study of ethnicity is to explore ethnicity, first, as group belonging, second, as identification and representation, and, third, as social practice. This distinction is analytical, since all three aspects will be part of any ethnicity. Since ethnicity has become theoretically central in other disciplines than the ones traditionally working with ethnicity, such as sociology, social anthropology, and history (Bulmer & Solomos, 1999, p. 2), the three perspectives will at the same time highlight distinctive disciplines and traditions. The more different disciplines adopt ethnicity as an analytical concept, the more it becomes essential to keep up a critical discussion of the methodological value of the concept. Therefore, a short presentation of key issues of this discussion will conclude this entry.

The term "ethnicity" derives from the more commonly used "ethnic," which again derives from the Greek word *ethnos*. The meaning of ethnicity is rather unclear, since it sometimes refers to a quality of an ethnic group and, at other times, to a quality of the member of an ethnic group (Chapman, McDonald, & Tonkin, 1989, p. 15). This uncertainty reflects the different approaches favoring either the group or the individual perspective. The Greek term *ethnos* was used as a synonym for non-Christians and non-Jewish pagans, but also for tribes, groups, and bands of people unlike one's own (Hutchinson & Smith, 1996, p. 4). Thus, from the very start the concept refers to a dichotomy between "us" and the ethnic "others." "We" were seen as the norm while the ethnic aspect connoted deviance from the norm. To this regard, a hierarchical dimension is added to the terminology of ethnicity. However, ethnicity is not always theorized as a concept that signifies hierarchical differences. On the contrary, from a functionalist and culture-relativist tradition, ethnicity has parallelized any ethnic group as culturally equal and therefore also in principle as politically equal. This is the key concept for claiming political rights as an ethnic group, and this approach has introduced a discussion between many theoretical positions explaining the dynamic of ethnic group belonging.

Ethnicity as Group Belonging

Ethno-national movements, ethnic revival, and ethno-politics are all concepts referring to group belonging. The key question is how ethnicity, as conveying commonality and connectedness, becomes a basis for identity politics. Two interconnected issues are part of this discussion. First, how to explain the sociopolitical force of ethnicity; second, how to explain the revival of ethnicity?

The force of ethnicity as a basis for politics has been deemed archaic and conflicting by Marxists as well as liberal thinkers. Its continuous influence has also given rise to a number of theories. Partly, the modern strength of ethnicity has to be understood in the perspective of the modern national state and nation-building processes. The German historian and nationalist Herder called for an understanding of a nation built on ethnic commonality and solidarity as the legitimate foundation for border drawing and national independence. He introduces ethnicity as a legitimate basis for politics by referring to primordial, descent-based ties and connectedness closely associated with territoriality and a shared language (Pecora, 2001). This legitimacy was closely related to ethnicity and it was argued as being constitutive of a natural group compared to self-chosen civic group belonging. Later, with the introduction of functionalism as a theoretical paradigm, the same cultural relativist approach was introduced within anthropology. Thus Geertz, back in 1963, was leaning toward a functionalist tradition arguing for the overpowering qualities of certain kinds of ties. Though, as Hutchinson and Smith emphasize, Geertz reasoned that the authenticity of these was to be found in the individuals' ascription of primordial roots to religion, blood, race, language, and custom (Hutchinson & Smith, 1996, p. 8). Even if the primordial understanding of ethnicity has since been theoretically challenged and rejected, it is important to bear in mind that the essentialist character of this understanding is still the basis for ethnic categorization and exclusion in social practices with material and political consequences.

The political organization in modern national states spreading throughout the 19th century was in the 20th century followed by a range of ethno-national movements due to postcolonial and postwar border drawings. Thus, the ethnic revival was prevalent among indigenous people and national minorities, claiming political rights or independence with reference to their ethnicity, unique culture, and territorial belonging. Their claims are based on ideas about ethnicity as primordial identity. Whereas anthropologists and colonial advisors during the colonial period had been active participants in defining the ethnic differences and groups, the following theoretical dismissal of a deterministic and functionalist concept of culture lead to a likewise theoretical rejection of the primordial claim. As theoretical self-reflection within the field of anthropology had made anthropologists aware of the problem with reification and representation of the "ethnic other," the approach toward ethnicity as a social force shifted in accordance with the general change within anthropology. One objection was that the primordial approach was not able to explain change in ethnicity or how ethnic groups are maintained while language and myths (the cultural content) are changed.

The anthropologist Barth has been the epitome of this change due to his 1969 essay on ethnic groups and boundaries. He introduced what today would be named an interactionist (or transactionalist) approach toward ethnicity (Jenkins, 1997). Barth claims that ethnicity is not the result of group characteristics, but rather the result of the relations to other ethnic groups. It is the boundary between groups, or the differentiation, that creates the group. Ethnicity is relationally constituted. So the content of the group's practices and culture can change, people can leave or join the group, without changing the ethnicity of the group (Barth, 1969). Jenkins (1997), a British anthropologist, later elaborated on the interactionist approach. He points out that ethnicity seems not to be defined by content

insofar as it sometimes refers to linguistic differences, and other times to religious, political, or cultural differences. What defines the difference that makes a difference is not the content but the relation(s) of the group. The difference that makes a difference depends on which group(s) the ethnic group defines itself and is identified in relation to. In this way, ethnic identity is similar to other social identities that have to be understood relationally. Thus, what makes it ethnic is not a certain amount of characteristics, but a certain idea—in other words, that identity is collectively inherited through generations as the foundation of a “natural” rather than a will-based community. However, Jenkins stresses that, even though the ethnic group is not defined by content, the ethnic relations generate different cultural content. This imagined ethnic community is maintained through reiterated boundary lining to the “other,” in which the group is reconstituted (see Barth, 1969). The boundary lining can be seen as an expression for simultaneously external and internal categorizations, which makes power an inevitable aspect of ethnic relations. Jenkins (1997) emphasizes the strength of external categorization for ethnic identification and thus highlights the possible stigmatizing aspects of ethnicity.

Another critical approach toward the essentialist perspective and the use of ethnicity for political ends can be found among the so called instrumentalists or circumstantialists, who mostly are presented as the quintessence of opponents of the primordialists. So instrumentalists argue that the claim of indigenous groups for ethnic particularity is by and large the result of uncertain traditions and colonizers and anthropologists’ categorizations and reification of an indigenous culture which was constructed in the interest of the powerful. What is called authentic is a construction (Keesing, 1989; Roosens, 1989). It is the reproduction of the “White men’s Indians.” The social group being constituted as ethnic is therefore not the result of primordial authentic roots, but of power relations, and political and socioeconomic interests. Ethnicity is not to be considered a natural, content-based phenomenon, but a social and political construction. By referring to the implicit reconstruction of the colonizers’ categorizations, the instrumentalists also point out the risk of further stigmatizing the indigenes rather than empowering them.

A standard objection against the instrumentalist approach, and its focus on rational choices, is that it cannot explain why or how specific symbols and cultural aspects are experienced as authentic and real by the group itself. Why those symbols and not others? Thus, anthropologist Cohen argues: “it is clear that identity (however inexplicit), boundary (however elusive and nebulous) and authenticity (however contested and contestable) are matters in which people invest huge value” (2000, p. 5). Likewise, despite the fact that ethnic groups are imagined communities and ideological entities, ideas do also carry with them material consequences, in the form of the politicized nature of ethnicity (Bulmer & Solomos, 1999, pp. 4–5), but also as cultural practices. Thus, Smith (1986), professor of sociology, stresses the importance of myths and symbols playing an important role as tool for memory in unifying populations and ensuring continuity over generations. He represents what was later labeled an ethno-symbolic approach (Hutchinson & Smith, 1996, p. 9). The focus is on the emotional intensity and historical heritage of ethnic groups. Hutchinson and Smith (1996, p. 6) suggest a definition of an ethnic group in accordance with this approach: “a named human population with myths of common culture, a link with a homeland and a sense of solidarity among at least some of its members.”

This definition might be inadequate though when the talk falls on migrant groups categorized and institutionalized through ethnic terms. They may not feel a sense of solidarity or share myths of common culture, even though they are signifiers of a certain ethnicity and categorized as such. This locates the reason for some to distinguish between ethnicity referring to ethno-national groups and ethnicity as referring to migrant groups in a global setting (Holton, 1998, pp. 148–50). At least, it supports the approach where ethnicity is explored rather as a category than as a group.

Ethnicity as Identification and Representation

Notwithstanding the fact that ethnicity refers to group identity of some kind, increasingly the concept is related not only to the understanding of the group as such, but also to the understanding of the individual members' identification with ethnicity. At the same time, the use of ethnic categories is not only a question of self-identification, but also one of categorization of the ethnic "other." Categories of self-identification and social ascription become the issue (Barker & Galasinski, 2001). Instead of referring to the ethnic group as a social entity, ethnicity becomes a discursive construction including performative and signified aspects of ethnicity. The turn toward discursive perspectives is closely related to the emphasis on the social and cultural complexity of a global world, wherein the movement of people across borders has raised new questions about the understanding of, for instance, belonging, integration, cultural identity, cultural conflicts, and the relationship between place and identity. The landscapes of group identity—the ethnoscapesc—have changed (Appadurai, 1990). Hence, how does ethnicity become part of these processes?

The focus on ethnic categories is part of a general critical rethinking of concepts like race, nation, gender—and ethnicity. They are categories that have been presented as objective, even natural, analytical categories, though they are social and historical constructs (Bourdieu, 1989; Miles, 1989; Hall, 1992). They are "representations formed through regulatory discourses of power" (Barker & Galasinski, 2001, p. 125). Anthropology, cultural studies, and postcolonial studies introduced a debate on representation in the 1980s wherein a similar critique of the stereotypical and reified representation of the "other" was raised (Clifford & Marcus, 1986; Hall, 1992). Consequently, a range of studies has since critically examined discursively produced ethnicities. Some have critically analyzed the construction of national majorities' hegemonic discourses on ethnic minorities and how these have come into being in the media, in politics, or as commonsense discourse (van Dijk, 1984). Others have analyzed how members of an ethnic categorized group interact with the external categorization and in the process reproduce, reject, negotiate, mediate, transgress, internalize, or reconstruct the ethnic category imposed (Hall, 1992; Bauman, 1996).

This overall interest in the simultaneous process of internal and external categorizations has been applied across disciplines. The individual's navigation within different and potential opponent categorizations has increasingly been the object for anthropology and psychology. Within classical social psychology the focus has been on how the ethnic and other stigmas affect the identity and identity strategies of the stigmatized, particularly when the ethnic "other" internalizes the negative attributes of the stigma (Tajfel, 1978). Whereas this might result in constructions of the ethnic "other" as defined by a "negative" identity, the focus on agency and subject positioning within social studies has introduced a more active ethnic agent, not being reduced to its stigma.

In a migrant setting, an individual community member might simultaneously be a member of other communities (Hall, 1992; Bauman, 1996; Levitt & Glick-Schiller, 2004). Rather than exploring the ethnic element per se, ethnicity becomes one element among several, since the individual in a complex society conveys multiple identities and possible transnational identities. The individual might simultaneously belong to different communities within the receiving country and to different nations, and take part in cross-border practices. Thus, the significance of ethnicity becomes positioned, situational, and contextual, on the one hand, and an expression of hybridity, syncretism, and mixture, on the other. At the same time, this approach has adopted an identity concept, where the process of identification is the key point. Ethnic identity is about coming into being through the identification with ethnic signifiers. In this context, the ethnic category is a subject position offered to the individual. Furthermore, and according to this perspective, the ethnic subject position should not be studied in isolation from other subject positions like gender, nationality,

class, age, and so on. Today, an intersectional approach seems almost an inevitable component of ethnic studies. The point is that social categories have to be analyzed as mutually constructed and hierarchialized.

Researchers with an interest in politicized aspects of interaction between the majority's categorizations of the ethnic "other" and the minority's possibilities for identity and political claims have also taken up this issue. They emphasize how the majority's categorizations become institutionalized through politics, like laws of citizenship, integration, asylum, and so on, and how these define "opportunity structures" for the ethnic minority to be contained by (Soysal, 1994; Statham, 1999). Statham (1999) demonstrates how the antiracism politics of Britain construct its minorities with racial categories and thereby privilege political claims with reference to racial identities over ethnic and religious identities. He argues how the institutionalized racialization directly affects the patterns of political claims among minority groups.

Ethnicity as Social Practice

Whereas the presented theories on ethnic group belonging focus on how to explain the motivation for ethnic revival and movements, and the theories on ethnic categorizations focus on discursive constructions of ethnicity, ethnicity has also been studied as a social practice with a stronger focus on self-understanding as "situated subjectivity" and the "practical sense" that persons have of themselves and their social worlds (Bourdieu, 1990; Brubaker, 2004, p. 44). This approach emphasizes emotional and cognitive aspects of ethnicity. Bentley (1987) argues with Bourdieu that ethnicity must be analyzed as habitual dispositions. In this perspective, "sensations of ethnic affinity are founded on common life experiences that generate similar habitual dispositions" (Bentley, 1987, p. 32). Thus, the reproduction of the collective position of an ethnic group within a differentiated social field depends on established dispositions of habitus (p. 41). Consequently, in order to explain the ethnic mobilization, the researcher needs to identify these dispositions that are a prerequisite for mobilizing the followers (p. 47).

The social-practice perspective does not ignore the differential aspect of the group, but, rather than analyzing the power relations involved, it focuses on the outcome of the relations and how the relations are sustained through social practice. It seems to claim that ethnicity is not only constituted relationally or as a reaction toward or reproduction of ethnic differentiation. As a critical response to the focus on labeling the "other," Ortner reminds us that ethnic-minority groups are not defined only by the lack of power in relation to the (ethnic) majority. Their culture is not only reactive, but also proactive (Ortner, 2006, p. 50). Ethnic-minority strategies against domination have been epitomized as "ad hoc and incoherent, springing not from their own senses of order, justice, and meaning, but only from some set of ideas called into being by the situation of domination itself" (p. 50). Ortner argues that ethnic groups have their own politics which have to be studied in accordance with the ethnographic ideal about thick description rather than the thinning culture, which the focus on power relations seems to produce.

Worth a mention here is also sociolinguist Fishman who in the socialization of the family finds habitual, language-based, inherited dispositions for solidarity and loyalty toward one's ethnic group. Despite of an almost primordial approach to the metaphysical and mystical power of emotional experiences of paternity, he suggests an analytical framework for analyzing different aspects of ethnicity: ethnicity as being, doing, and knowing. Ethnic being is according to Fishman (1989) a bodily and directly experienced reality, just as language is a bodily experience. Ethnic doing is more negotiable and refers to often linguistically expressed traditions, such as songs, sayings, prayers, rites, jokes, and riddles.

Ethnic knowing refers to the idea of the language of the authentic, where language contains knowledge. The perspective on doing can be said to be in accordance with Smith's focus on the symbolic reproduction of ethnicity. Likewise, it is possible to argue that ethnicity is reproduced through social practices of storytelling and narration. Ethnicity is reproduced through memories about the ancient past and passing down memories through generations. Through telling stories about an often nostalgic past within the ethnic community, ethnicity is practiced and reproduced (Tonkin, 1992).

However, the risk of these approaches is to reproduce a functionalist explanation, where the group is self-sustaining. As Ortner (2006) points out, it is not a question of leaving out the external power relations, but neither should one reduce ethnicity to only a result of external categorizations.

Ethnicity as a Methodological Challenge

The overall change from the understanding of ethnicity as a natural, primordial phenomenon to ethnicity as a discursive formation has left an important impact on the methodological reflections related to the studies of ethnicity. The researcher is reminded not to take commonsense categories for granted (Bourdieu, 1989) and to resist the naturalization of ethnic identity (Jenkins, 1997). In other words, the researcher should not uncritically adopt categories of ethnopolitical practice as his or her categories of social analysis. It is necessary to distinguish between ethnic categories and groups (Jenkins, 1997; Brubaker, 2004, p. 12), given that a person being categorized as an ethnic "other" does not necessarily belong to or identify with the ethnic group in question. Furthermore, by taking the ethnic category for granted, the researcher risks "ethnicifying" a given conflict, event, person, group, or phenomenon, and thus taking active part in the institutionalization of the social significance of particular ethnic differences. Ethnicity is fundamentally a way of perceiving, interpreting, and representing the social world; it is not a thing in the world but a perspective on the world (Brubaker, 2004, pp. 17–18). Therefore the researcher needs to reflect on how he or she takes part in reproducing specific ethnic perspectives on the world. In order to avoid a blind reproduction of a commonsense and politicized use of ethnicity, the researcher needs to ask the question "how is ethnicity constructed?" and to explore this process of construction within the field under study.

Another aspect to consider is how the researcher potentially takes part in displacement or reduction of a societal problem by letting different analytical categories conflate. "Race" has in some circumstances been replaced by the concept of ethnicity as a concept of difference, and in that process the institutionalized racism inscribed in the category has been silenced by a seeming respect for ethnic differences (Miles, 1989). Also, socioeconomic inequalities risk being hidden by a seeming tolerance for ethnic differences within a multicultural context. Consequently, the researcher should not subscribe to a broader, inclusive notion of ethnicity without recognizing the intersectional aspects of, for instance, "race," class, gender, age, religion, and ethnicity, and understanding the particular aspects each brings to symbolic distinction and social division (Ruane & Todd, 2010, p. 2). This is the only way to secure an explanatory purchase on ethnicity.

Ethnographic Approaches to Literacy Research

DAVID BARTON

The Development of Ethnographic Approaches to Literacy

In the past 30 years new ethnographic approaches to literacy research have been developed, and a wide range of studies of the role of reading and writing in society have been carried out. Historically, the study of reading and writing in applied linguistics drew upon psychological approaches to the “skills” of reading and writing, but the field has more recently drawn its inspiration from anthropological traditions. Early on, Basso (1974) referred to the ethnography of writing. A few years later, when providing an overview of the sociolinguistics of reading and writing, Stubbs argued for the need for ethnographic studies as so little was known about people’s uses of literacy (Stubbs, 1980, p. 164). In the USA a key foundation of literacy studies was the work of Shirley Brice Heath (1983) researching the disjuncture between family and school ways of using language and literacy in Appalachian communities in the USA. Heath’s use of the concept of “literacy event” became central to literacy research and was partly developed in parallel with the notion of “speech event” used in research on the ethnography of communication.

The other key idea for literacy research alongside literacy events is that of “literacy practices,” stressing the idea that reading and writing are located in social practices. Applying the term “practices” to literacy has its roots in the work of the British anthropologist Brian Street. His research in Iran (1984) provided a broader theory of literacy based on social practices, which was taken up by applied linguists developing the field of what is referred to as (new) literacy studies. Literacy practices and literacy events complement each other: Practices refer to the general cultural ways of using reading and writing, and literacy events are particular instances of people drawing upon their cultural knowledge (Barton, 2007, pp. 35–7). The hallmark of much literacy studies research has been detailed investigations of particular situations. Identifying the literacy events often provides a good starting point for a research study. Researchers then identify particular configurations of literacy practices in different contexts, which can be referred to as different literacies. The concept of literacy practices provides a way of bringing broader cultural and structural aspects into a specific situation, and linking literacy practices to issues of power. Practices can be seen as theoretical, describing regularities and patterns which are abstracted from particular events. Ethnographic approaches examine people’s practices in particular contexts, and they provide both a framing theory and a methodology.

Overview of Studies

There has now been a range of ethnographic studies of literacy reported in books, articles, dissertations, and conference papers over the past 30 years, covering home and community life, workplaces, and educational settings. In examining these studies, at the outset we need to distinguish the idea of “doing an ethnography” from using “ethnographic approaches.”

Historically, anthropologists carried out long-term intensive studies of a whole culture and then wrote “an ethnography.” Many of the studies of literacy are narrower and more focused, and they can be described as drawing upon ethnographic approaches without being full ethnographies (as discussed in Bloome & Green, 1992).

Ethnographic studies have identified the distinct literacies in different domains of life. For example, studies examine everyday life (Barton & Hamilton, 1998), including multilingual contexts (Martin-Jones & Jones, 2000). Often they have a specific focus, such as religion (Kapitske, 1995), or workplaces (Belfiore, Defoe, Folinsbee, Hunter, & Jackson, 2004), or prisons (Wilson, 2003). Work covers a range of cultures including Street’s work in Iran, mentioned earlier, Ahearn’s study of the writing of love letters in western Nepal (2001), and a set of studies of adults in everyday settings in South Africa (Prinsloo & Breier, 1996). There has been a study of the place of writing in an indigenous community in Ecuador (Wogan, 2004) and of scribes and their clients in Mexico (Kalman, 1999). Vernacular texts and practices have been studied in Tuvalu (Besnier, 1995), in central Africa (Blommaert, 2008), and in Namibia (Papen, 2007). A recent set of studies of everyday life and workplaces draws together research from English-speaking and French-speaking countries (Barton & Papen, 2010), and there are studies of literacy practices on the Internet.

Such studies demonstrate that social practices around literacy vary and also, more fundamentally, that what is meant by the terms “literacy,” “reading,” and “writing” differs across cultures; and that these activities can have different roles in people’s social practices. Furthermore, not just crossculturally but within different contexts in the same culture, such as the home and the workplace, and even within the same activity, there can be different meanings of reading, writing, and literacy.

Many studies focus on education. Cruikshank (2006) is a good example of a study which mixes the ethnographic approaches of literacy studies with discourse analysis, focusing on teenagers’ use of technology and the links between home and school; the study identifies the importance of networks, mediation, and roles. Purcell-Gates (2007) provides a set of case studies looking for “new pedagogies for new literacies” (p. x). The studies in Street (2005) also cover many educational sites. The set of studies in Mahiri (2004) identify the literacies in the everyday lives of urban youth, illustrating wide-ranging possibilities of learning in and out of school. Other work unpacks the dynamics of different literacies within classrooms.

Characteristics of Ethnographic Approaches

These studies are diverse in their methodologies. Nevertheless, there are some overarching characteristics of ethnographic approaches. One defining characteristic of ethnographic approaches is that they are interested in locating particular instances in their broader cultural context. Understanding this cultural context involves making sense of specific activities, and in this way ethnographic studies of literacy are interpretative. This means accepting that there can be different perspectives on an event, and that its participants can have different perceptions of it. Contemporary ethnography accepts uncertainty, and it accepts that different people have different understandings of the same situation. This has always been important for research into literacy where, in education for example, the term has often been disputed, with teachers, policy makers and researchers having different perspectives on its significance; and many studies therefore start with an investigation of the meaning of the term. The fundamental question *what is literacy?* recurs throughout such research.

A further important characteristic of ethnographic approaches to literacy research is the focus on individual perspectives, and an interest in the sense-making and theorizing of participants. Being interpretative also means that analysis involves sense-making and

theorizing on the part of researchers. This sense-making aspect of ethnographic research is crucial, and most of the theorizing about the nature of reading and writing which has developed the field so dramatically in the past two decades has been in relation to the qualitative data obtained from ethnographic studies.

Individual studies identify themes about the nature of literacy. One of the strengths of the field is that we can now view a wide range of studies and identify repeated findings and common themes. This builds a powerful base of evidence. For example, one repeated finding from literacy studies research has been the importance of other people in a person's literacy practices. Barton and Hamilton (1998), for instance, have shown the importance of the networks of support in which individuals are located. Other research has referred to the scribes, mentors, brokers, and mediators of literacy practices, and the significance of people acting as part of broader groups, whether they are identified as "communities of practice" or "affinity groups." In general, an ethnographic approach shifts the focus of research from the lone individual, common in traditional psychological paradigms, to the activity or the interaction in which people participate, and to broader institutional structuring.

Deborah Brandt (2009), drawing on historical research, talks of the role of individuals and institutions acting as "sponsors" of literacy practices, and as supporters and facilitators for people. Institutional sponsors can include businesses, governments, and religions. These sponsors support specific views of the nature of reading and writing, and advocate on behalf of these views. Such concepts help the researcher go beyond specific sites, and see the dynamics of texts moving across contexts. The detailed work of literacy studies shows the ways in which written texts are detachable from the social situation that originally produced them, or from the place where they were first used (as in Blommaert's study, 2008). Written documents are constantly being reused and recontextualized, and they move between physical places and social spaces. Texts therefore need to be studied in terms of what they are, beyond a specific moment of use. This brings in the dynamics of power, including issues of gender and unequal access.

These studies offer a set of theoretical concepts, such as *networks*, *sponsors*, *textualization*, and *brokers*, which are useful in understanding literacy. They can also be used to challenge myths about literacy as individualized, decontextualized skills, and an important role for ethnographic data has been to provide a critique of such misperceptions. Even the basic concepts of *literacies* or *practices* have been powerful in enabling people to reconceptualize literacy.

Methodology and Methods

As with all research, there is a close link between theory and methodology in ethnographic literacy research, and each informs and constrains the other. The view of literacy as being part of social practices which are inferred from events and mediated by texts requires a certain methodology for empirical research. The methods of data collection and analysis require attention to detail, and they draw on the underlying philosophy of examining particular instances in order to understand broader patterns. In a single study researchers may integrate a variety of methods including observation, interviews, the analysis of texts, the use of photography, and more. Researchers in the studies reviewed above have been innovative in developing methods which are ethical, responsive, and collaborative and have been part of a more general "reflexive turn" in qualitative research.

Methodology is much broader than the research methods and covers everything from the first formulation of the research, through to analysis and impact, and including the writing up of research. Attention to methodology has grown in the past 20 years as ethnographic research has been seen as part of the social sciences, and as a crucial component

of qualitative research. Ethnographic approaches to literacy have developed alongside other qualitative approaches to provide more explicit methodologies (as in Barton & Hamilton, 1998, chapter 4) and to address the issues of research methodology which have to be faced by all social sciences (as in Denzin & Lincoln, 2008). These approaches need to address general social science concerns such as sampling and validity, and the nature and systematicity of evidence. For instance, a multimethod approach within any one study is a particular strength: that a piece of evidence is corroborated by more than one sort of data is an important form of rigor. Such research needs to understand the sorts of generalizations which can be made from specific cases, even though these may be quite different from those made in quantitative research paradigms. The way in which cases are chosen needs to be made clear, and the idea of a “telling case,” for instance, is not a straightforward issue. It is always important to know what a case represents, and why it was selected. And, when writing about it, there are issues of representing other people’s perspectives which need to be addressed.

It can be revealing to locate ethnographic approaches in these broader research traditions. Often ethnographic methodologies include other qualitative approaches such as history, narrative analysis, or grounded theory. (See Merriam, 2009, who distinguishes these approaches clearly, pp. 21–37.) Literacy as social practice can be used as an orienting theory, the theory which a researcher starts out with and which is used to provide initial framing for the studies. Other “mid-level” social theories can come in as explanatory theories, which are used to make sense of the data. Studies have drawn on a broad range of theories, such as actor network theory (Hamilton, 2001) and institutional ethnography (Smith, 2005); these are distinct approaches which nevertheless focus on the contemporary, textually mediated social world. One aspect of these developments is the way in which they move the starting point of the research from the practices of individual people to broader cultural practices. See, in particular, the work of Scollon and Scollon (2003). Other studies juxtapose ethnographic approaches with discourse analysis. These become powerful ways of researching and analyzing texts and practices. Another way of broadening literacy studies has been to locate it in the developing field of linguistic ethnography, in Britain for example, and this is likely to be a productive development (Creese, 2010). And one final methodological development is a shift from ethnographic approaches solely associated with lone scholars and individual interpretations, to collaborative ethnography involving researchers working in a variety of ways with each other and with informants.

The Value of Ethnographic Studies of Literacy

Ethnographic approaches to literacy provide a distinctive contribution in many areas. Although such studies look initially at people’s practices, that is the uses and meanings of literacy for them, rather than starting with the aspect of learning, many studies are rooted in educational concerns. Focusing on individuals’ everyday uses of literacy is important for educational research in that it enables links to be made between what goes on in education and what happens in other domains of activity, such as everyday life including workplaces. Heath’s (1983) work, discussed earlier, was foundational in that it was based on questions about the relation between language and literacy in home and school in different communities; and that issue has remained fundamental to much literacy research in the USA, as in many of the studies mentioned above.

These studies provide data which can be used by practitioners, policy makers, and researchers when planning educational provision, from curriculum design to details of classroom activities, and on to broader issues of relations with communities. Nevertheless,

what counts as acceptable evidence is different for different groups of people. Crucially, if we are concerned with literacy education, what makes sense to a learner and what convinces a practitioner is something which resonates with, and develops from, their situated practice. And this may be very different from what convinces a policy maker. In developing a theory with a set of related terms, literacy studies offer educational practitioners an enriched language to communicate with when discussing literacy issues. The language of "literacies," "practices," and so on, can provide a powerful alternative discourse for framing language and literacy issues, one which includes a critical voice articulating learners' perspectives. Such studies also suggest methods for investigating literacy practices, and for reflecting on and selecting practices which practitioners can draw upon. Bringing data, theory, and method together, the approach of literacy as social practice can be developed into a social practice pedagogy.

Focusing on individuals' perspectives is important when discussing issues of learning, especially where researchers are interested in the links between everyday learning and learning in educational contexts. It is here that an ethnographic stance is crucial. When adopting an ethnographic approach in such studies, this may mean being well-meaning, respectful, and ethical, and such approaches may be necessary for carrying out effective research which has an impact on practice. To give a specific example, in our study of adult learners and the uptake of learning opportunities (Barton, Ivanic, Appleby, Hodge, & Tusting, 2007), issues of motivation, recruitment, retention, and persistence were raised by practitioners and policy makers in the field of adult literacy education. Central to these issues, though not always acknowledged, is the question of learners' perceptions. Learners are the active agents in being motivated, in deciding to attend and to stay in class, and to engage and persist in their learning. The learners are central in these educational issues, which all hinge on issues of identity, agency, reflexivity, and subjectivity. Understanding these concerns of learners is essential for effective pedagogy, and they are issues which can best be addressed by ethnographic research.

An ethnographic approach starts with a distinct epistemology, or theory of knowledge, and provides a distinct discourse about literacy. Different epistemologies presuppose different views of the world, and can lead to clashes and misunderstandings. Ethnographic approaches therefore need to interact with other approaches in addressing the complex problems which face education, and society more generally. Researchers need to consider what a particular approach can offer, and what it cannot. They need to understand the complementarity of other qualitative approaches, such as history and mass observation, and also to make links with a variety of approaches from different traditions, especially with various strands of quantitative research such as surveys and cohort studies.

The importance of ethnographic research on literacy is much broader than its impact on education. As well as providing a critical discourse within education, it can also be used to challenge contemporary discourses about the changing workplace which, like education, often draw upon a narrow skills discourse, and imply a "deficit discourse" of blame. One finding implicit in this line of research is that most contemporary social practices involve texts of some sort. In carrying out many activities in life people use texts, and there is an increasing "textualization" of life. This means that literacy is a component of most social practices, and that we live in a textually mediated social world. Paying attention to aspects of literacy in a social practice is particularly important at a time when social life, and especially the technologies of knowledge and communication, are changing rapidly. Ethnographic research on literacy, with its emphasis on texts and practices, is well placed to understand these changes, to address contemporary issues such as globalization and migration, and to provide a powerful analysis of language in new contexts of writing, such as online spaces.

Ethnographic Approaches to Second Language Acquisition Research

KATHRYN A. DAVIS

Ethnographers have long engaged in sociocultural studies of first language socialization, second language development, and situated language use. Early scholars who combined interests in anthropology and the study of language included Edward Sapir, Benjamin Whorf, and Kenneth Pike. As a linguistic researcher, Pike drew on early ethnographies, such as the work of Malinowski and Whorf, in arguing for understanding language as embedded in structures of human behavior. While linguistic anthropology was stabilizing as a recognized discipline, Chomsky's psychologically oriented theories of innate universal grammar began to emerge in the late 1950s. Early differential perspectives between context-embedded and psychological-based language-development theories foretold later divergence in epistemological and methodological approaches to second language acquisition inquiry.

This account focuses on the historically situated development of ethnographic approaches to language studies in relation to the emerging field of second language acquisition. It is intended to show how major social-science research eras have impacted qualitative language studies and further suggest current and future research trends in second language research. Rather than a strict chronology, the following discussion of modernism, interpretive trends or blurred genres, and postmodernism assumes the melding of eras and ongoing crossover of epistemological, theoretical, and methodological approaches.

From Modernity to Modernism

The first Western ethnographers wrote positivist field experiences that were considered valid, reliable, objective, and timeless representations of social, cultural, and linguistic behaviors. Although early anthropologists considered themselves free of bias, they commonly viewed the "other" whom they studied as strange and primitive. Thus, ethnography at this time embodied an amalgamation of positivism, colonialism, and context-oriented structuralism. Although linguistic ethnography and language acquisition as framed by Chomsky were both grounded in positivist epistemology, the mind-context epistemological divide during the modern era widened as sociologists and anthropologists began to move away from traditional deterministic views of language learning and use towards constructivist approaches to the study of communication.

In his groundbreaking book *The Presentation of Self in Everyday Life*, sociologist Erving Goffman (1956) suggested that individuals actively construct their social identities rather than passively perform particular cultural prescriptions for social behavior. He argued for studying how individuals construct identities and mutually negotiate meaning in face-to-face interaction. Based on Goffman's work, sociolinguists such as Sacks and Schegloff studied organization of turn taking in conversation and classroom discourse. This work influenced the conceptualization of conversational analysis (CA) that explores interaction as minute-by-minute co-construction of discourse and interaction as it unfolds over time. Implicit in this approach is the assumption that select sections of taped and transcribed interaction are sufficient for researcher analysis and interpretation of meaning making.

In direct opposition to Chomsky's cognitive language theories and decontextualized approaches to communicative studies, anthropologist Dell Hymes (1974) proposed the ethnography of communication. He argued that speech acts and other communicative events cannot be fully understood without attending to culture and context. Gumperz (1982) bridged the study of interaction and culture through his "crosstalk" research that explored how taken-for-granted background assumptions affect negotiation of meaning in intercultural encounters. His theories of "contextualization cues" significantly influenced interactional sociolinguistics (IS), a combined sociology and linguistics approach to examining discourse strategies across cultural, ethnic, racial, and gender backgrounds. Both IS and ethnography of communication theories and methods influenced studies of cross-cultural communication in classrooms (Cazden, John, & Hymes, 1972); participation structure differences between community and classroom interactive norms (Philips, 1983); and comprehensive analysis of sociocultural language and literacy expectations in racially, economically, and culturally diverse communities (Heath, 1983). Heath's study was notable in its use of a wide range of research methods (participant observation, interviewing, discourse and textual analyses); the scope of the study (working-class black community, working-class white community, and middle-class white or black community members and teachers); and the influence on the theoretical shift from cultural-deficit to cultural-difference explanations for school failure.

Other ethnographic approaches to the study of language and culture at this time included language acquisition and socialization research (e.g., Schieffelin & Ochs, 1986) and Erickson's extensive work on micro-ethnography (1986). These approaches focus on close observational and textual analysis interpreted through an ethnographic understanding of cultural and social context. Qualitative research accounts during this era generally followed a framework of analysis intended to determine how social behavior and interaction operate in systematic ways that signal situated identities. With increasing qualitative interest in the study of language interaction and socialization, many ethnographers and sociologists sought to formalize qualitative methods. Researchers (e.g., Glaser & Strauss, 1967) tended to promote rigorous methods based on the postpositivist epistemological tenets that truth and knowledge are rational, objective, unified, and can be approximated in ethnographic or qualitative descriptions.

At this same time, first language acquisition psycholinguistic case studies (e.g., Brown, 1973) and Chomsky's (1975) cognitive-based language acquisition theories led to the development of the second language acquisition (SLA) branch of applied linguistics. SLA drew heavily on formal linguistics and its associated field of sociolinguistics which was largely viewed as the study of language use. The notable work of sociolinguists such as Labov and Bernstein tended to take positivist or postpositivist perspectives in utilizing the analytical, quantitative, and structured-interview research methods that then dominated the field. Thus, the emergence of SLA founded on cognitive theories and psychological models of scientific inquiry as well as sociolinguistic structuralist accounts diverged from ethnographic studies of language or literacy socialization or use and the co-construction of meaning through interaction.

Interpretive Trends and Blurred Genres

In landmark publications, anthropologist Geertz (1983) brought into question the nature of reality and the centrality of local studies. More specifically, he argued that all anthropological writings are interpretations of interpretations and, thus, the observer has no special insight into reality. Geertz suggested that ethnographers explore local situations and acknowledge the interpretive nature of analyses and presentation of findings. He also

argued that an interpretive approach implies the blurring of boundaries between the social sciences and the humanities. Researchers subsequently have sought new models of truth, method, and (multimodal) representation while increasingly engaging in reflexivity and calling into question issues of gender, class, and race. A blurring of research-methods boundaries and terminology has similarly occurred across social-science fields and increasingly in applied linguistics. In Denzin and Lincoln's (2005) *Handbook of Qualitative Research*, interpretive qualitative research and interpretive ethnography are used interchangeably.

One of the clearest shifts within applied linguistics toward interpretive research approaches was in the field of gender studies. Research and theoretical perspectives in this area began to move from viewing gender as an individual and generalizable trait toward studying gender as a social construction within specific cultural and situational contexts (Eckert & McConnell-Ginet, 1992). A notable interpretive and gendered representation of blurred genres is Anzaldúa's (1987) *Borderlands/La Frontera: The New Mestiza*. In this bilingual (Spanish and English) collection of essays and poems, Anzaldúa explores the notion of identity through her own multilingual and sociocultural experiences as Chicana, lesbian, and activist. She challenges traditional and modernist binary, apolitical, monolingual, and scientific representations of social inquiry through using literary venues to define "borders" as an inhabited space and legitimate identity. While applied linguists have not challenged written representations to a similar degree, there has been a growing tendency toward contesting dominant Western or modernist paradigms through alternative (non-Western) knowledge and genre constructions.

An increasing number of ethnographic studies within and across multilingual contexts began to emerge at this time, particularly in the fields of language policy and planning, language learning, and schooling. Ethnographies began to take on a political edge in advocating for equitable language and culture schooling. Hornberger's (1989) extensive language policy and planning work with Quechua communities and schools supported indigenous language maintenance. Davis (1994) argued for bottom-up language planning through her ethnographic study of multilingual schooling and class variation in language socialization and use in Luxembourg. Valdés's (1996) landmark ethnographic portrait of Mexican families in the USA promoted schooling that respects culturally diverse families. Zentella (1997) advocated for multilingual-education reform through her ethnographic study of Puerto Rican children in New York that documented the complex linguistic and social nature of growing up bilingual. While ethnographic studies of bilingualism have greatly increased since the 1970s, SLA studies have tended to focus on monolingual competence in studies of cognitive-based language development. Yet theorists such as Ortega have recently urged the SLA field to include research on bilingualism. At the same time, ethnographers who work in the SLA and education fields have increasingly moved toward interpretive qualitative or ethnographic studies that draw on postmodern epistemology and theories which consider the multilingual and multimodal nature of inquiry.

Postmodernism

In the 1980s and 1990s postmodernism began to take hold in SLA and the larger field of applied linguistics. Postmodernism considers the nature of knowledge as multifaceted, locally situated, and time and context bound. This philosophical position opposes research assumptions of political neutrality and argues instead for examination of power relations in language and literacy studies. Poststructuralism specifically refutes the notion that language can be understood in structuralist terms as a network of systematically linked propositions and coherent organized units. During this era, new-literacies studies scholars (e.g., Gee, 2000) advanced research based on the premise that, rather than a set of static,

decontextualized, and discrete skills, literacy is always dynamic, multifaceted, power laden, and situated in local practices. Applied linguists and socially situated SLA researchers have increasingly focused on language and cultural diversity in investigating multiple communication channels, hybrid textual forms, and new local and global social relations. Rampton's (1995) study of hybrid language crossing, in which Afro-Caribbean immigrant youth learned Punjabi, revealed how competing discourses transformed into collaborative language learning. Postmodern SLA interpretive qualitative or ethnographic studies also focus on power relations from ever-evolving, changing, locally and politically situated perspectives. Norton (2000) drew on poststructuralist theories of social identity and used data from diaries, questionnaires, individual and group interviews, and home visits to describe how five immigrant women in Canada created, responded to, and resisted opportunities to speak English. She further argued for reframing the notion of language-learner motivation as investment realized in situated interaction and dependent on social needs and desires. Lam's ethnographic case studies (e.g., 2000) examine the complexity of culture, identity, audience, and media that emerge in new forms of multimodal and bilingual online writing. Lam (2000) and Warschauer's (1999) ethnographic studies emphasize the centrality of identity and potential for an increased sense of agency through technology-based second language writing and other multimodal literacies. Duff (2004) investigated intertextuality or discursive hybridity associated with spontaneous references to pop culture in ethnographic descriptions of teacher-led discussions in a Canadian high school. Increasing numbers of ethnographic studies are also based in geographic regions other than North America and Europe. Kanno's (2003) study of four bilingual schools in Japan found that bilingual children are socialized into stratified school visions of future social positions of their students. Lin and colleagues draw on postmodern theories in collaborative analyses of coauthor narratives that argue for appropriating English, expanding identities, and revisioning TESOL (Lin, Wang, Akamatsu, & Riazi, 2002).

Researchers and theorists have also utilized a range of approaches to theorizing social and political meanings that can inform local studies. Critical scholars such as Pennycook, Phillipson, and Skutnabb-Kangas have long offered textual and social analyses that further understanding of the political and social meanings of actions such as those associated with English imperialism and globalization. Alim, Ibrahim, and Pennycook's (2009) edited volume provides qualitative descriptions of a global hip-hop movement in which languages, cultures, and styles are appropriated, integrated, and transformed by youth.

A growing number of language, literacy, and education specialists (Luke, 2002) are calling for participatory research approaches to addressing inequitable educational outcomes. Participatory action research (PAR) has evolved as a collaborative effort among members of social communities and researchers to bring about democratic and emancipatory investigations of processes and outcomes (Davis, 2009). PAR works toward placing local participants at the center of investigations while striving to awaken a sense of injustice among those with material and cultural power. Luke (2002) argues that the right to research for gaining strategic knowledge necessarily involves emancipatory discourses defined by Freire and colleagues as "forms of talk, writing, and representation that are counter-ideological and act to articulate and configure collective interests in transformative ways" (cited in Luke, 2002, p. 105). Luke specifically calls for critical discourse analysis that provides a positive thesis of productive discourses of power. This position suggests that "we would need to begin to capture an affirmative character of culture where discourse is used aesthetically, productively, and for emancipatory purposes" (Luke, 2002, p. 98). Davis (2009) described agentive research among youth in Hawaii that involved investigating multifaceted heritage-language and cultural identities while interrogating, challenging, and appropriating academic English practices. Canagarajah's reflections on future directions for research on multiliteracies emphasizes the need for transnational ethnographic studies

of students developing rhetorical negotiation strategies that modify, resist, or reorient to expectations for written academic discourse.

The postmodern social-science era saw exponential growth in the number and range of interpretive ethnographic and qualitative studies in applied linguistics and associated fields. Historical boundaries between qualitative-research approaches blurred and notions such as culture, context, and identity were understood as interpretive, ever-evolving, changing, and locally and politically situated. Journals such as *TESOL Quarterly*, *Anthropology and Education Quarterly*, *Journal of Language, Identity, and Education*, and *Critical Inquiry in Language Studies* promote multicultural, multilingual, non-Western, transnational, and various forms and representations of interpretive ethnographic or qualitative studies.

Contested Methods

While postmodern social scientists hold that qualitative research can no longer be viewed from a neutral or objective positivistic perspective, the present also offers a politically charged space of contested methods (Denzin & Lincoln, 2005). Many applied linguists have adopted the view that class, race, gender, and ethnicity intersect to shape identity and interact in transnational spaces so that inquiry reflects a multicultural and often multilingual process. Yet SLA researchers have taken a conserving position toward epistemologies, theories, and research methods. For example, tensions between social-anthropological and cognitive perspectives were portrayed in a 1997 special issue of *The Modern Language Journal* on SLA research in which Firth and Wagner led with a reconceptualization of SLA research that sought to “enlarge the ontological and empirical parameters of the field” (1997, p. 285). Firth and Wagner suggested that, beginning in the 1960s, tension has existed between “on the one hand, acknowledgement of the social, contextual dimensions of language, language acquisition and learning, and on the other, the centrality of the individual’s language cognition and mental process” (p. 288). These authors concluded that, while language is a cognitive function, it is also “fundamentally a social phenomenon, acquired and used interactively, in a variety of contexts for myriad practical purposes” (p. 296). A number of second language researchers from both theoretical positions responded to the Firth and Wagner position in this special issue. In 2004 Watson-Gegeo further advanced the social-anthropological position by stating that “cognition originates in social interaction and is shaped by cultural and sociopolitical processes: These processes are central rather than incidental to cognitive development” (p. 331).

In the meantime, political events concerning language learning in the USA and in other nations indicate movement toward a postpositivist, monolingual (or ESL or EFL), and standardized curriculum and assessment in public schools and associated research funding. In the USA, the Department of Education Office of Bilingual Education and Minority Language Affairs became the Office of English Language Acquisition in 2001, thus signaling a major shift from support for bilingualism to an English-only policy. The subsequent No Child Left Behind Act resulted in nationwide curriculum and assessment policies founded on “scientific-based evidence.” While this movement provided support for scientific-based inquiry among SLA scholars, many applied-linguistics activists such as Wiley (see Wiley & Wright, 2004) continue to argue for grounding research, evaluation, and theory in multilingualism, multiculturalism, and local control of education. There is also a growing social-justice movement across disciplines and geographic locations that argues for attending to issues of class, race, gender, and ethnicity as these are associated with language and power (Denzin & Lincoln 2005; see also the 2010 AAAL special session on “Linking Academic and Advocacy Interests among AAAL Members”). While researchers argue for social-justice-based research within the academy, indigenous and non-Western

scholars have engaged in a full-scale attack on Western epistemologies and research methodologies (Smith, 2005). Indigenous researchers such as Smith advocate for decolonizing the academy's scientific practices as they move toward local control of socially situated inquiry.

Current and Future Trends in Ethnography and Second Language Acquisition

The multifaceted histories of qualitative and ethnographic studies have allowed present-day researchers to engage in inquiry representing traditional, modern, and postmodern historical movements. Researchers can now draw on a vast array of paradigms, inquiry strategies, and methods of analysis depending on their theoretical and philosophical preferences. Interpretive ethnographers interested in second and multiple language development have also historically held and currently take an interdisciplinary and multimethod approach to understanding the nature of language learning and use. Many SLA scholars also now recognize both the social-contextual and the cognitive characteristics of second language learning and, thus, support interpretive ethnographic and qualitative studies of language acquisition. Current and future interpretive ethnographic and qualitative research trends generally lean toward breaking down traditional binary positions and moving toward acknowledging multiple epistemologies and methods in exploring the complex and sociopolitically situated nature of language acquisition.

Ethnography of Communication as a Research Perspective

GRAHAM SMART

This entry provides an introduction to the “ethnography of communication” for qualitative researchers interested in possibly adopting the methodology to study the complex inter-relationship between language and the sociocultural context of its use within a particular social group. The entry begins with some background on the origins of the ethnography of communication and the tradition of inquiry that subsequently developed, next describes the theoretical model underlying the approach, and then offers prospective researchers a series of questions to explore as a starting point for their inquiry.

The “ethnography of communication,” a qualitative research methodology introduced by anthropologist, sociolinguist, and folklore scholar Dell Hymes in his seminal 1962 paper, enables a researcher to study the distinctive configuration of discursive conventions, options, and constraints—that is, the “ways of speaking”—that structure the communicative activities of any given social group. An approach combining ethnography, the description, and analysis of culture, with linguistics, the description, and analysis of language, the ethnography of communication centers on the concept of the “speech community” (Bloomfield, 1933)—a group of people sharing a linguistic code as well as norms of discursive interaction, expression, and interpretation. In the decades since Hymes first conceived the ethnography of communication, researchers following in the same tradition have used the methodology to describe and explain the ways of speaking of many different speech communities in a wide range of geographical regions, while at the same time contributing concepts and theories to a larger meta-understanding of patterns of communication across human cultures.

Hymes occupies a place in a line of researchers that includes Franz Boas, Edward Sapir, and Benjamin Whorf, all of whom explored the relationship between language and culture through fieldwork among North American indigenous peoples. At the same time, Hymes also shares a lineage with Bronislaw Malinowski, J. R. Firth, and Firth’s student Michael Halliday in arguing that much of the meaning of language derives from the particular social context in which it occurs and that therefore the analysis of socially situated utterances and their contextually construed meanings must be central to the study of language. This latter stance can be seen as a reaction against the formal abstraction of Ferdinand Saussure’s structural linguistics, and then later, for Hymes, as a counter to the primacy of Noam Chomsky’s focus on a universal context-free grammar and ideal speaker-listeners.

While Hymes originally called his innovative methodology the “ethnography of speaking,” implying a focus on spoken language, he and linguist John Gumperz soon reconceived the approach along broader lines as the “ethnography of communication” (Gumperz & Hymes, 1964), with the possible objects of study expanded to include

the various available channels, and their modes of use, speaking, writing, printing, drumming, blowing, whistling, singing, face and body motion as visually perceived, smelling, tasting, and tactile sensation [along with] the various codes shared by various participants, linguistic, paralinguistic, kinesic, musical, and other. (p. 13)

Hymes (1981) would also later adapt the approach in a specialized form that he termed “ethnopoetics” to identify patterned poetic elements in transcriptions of oral narratives and folk tales conveying the myths of North American Aboriginal peoples.

Most of the other researchers who have applied the ethnography of communication and contributed to its development over the decades since its inception, however, have focused their work on spoken language, including, among the more prominent, Gumperz, Joel Sherzer, Gerry Philipsen, Richard Bauman, Susan Irvin-Tripp, and Muriel Saville-Troike. Saville-Troike’s *The Ethnography of Communication: An Introduction*, originally published in 1982 and now in its third edition (2003), has played a significant role in elaborating Hymes’s approach and in popularizing it among researchers in the fields of sociolinguistics and cultural anthropology. Saville-Troike’s volume provides a comprehensive account of the goals, theoretical underpinnings, research methods, and eventual products of the ethnography of communication. What is perhaps most valuable in the book for a researcher new to the ethnography of communication, however, is its highly detailed description of data types, procedures for eliciting information from informants, and methods of analyzing data—with much of this description illustrated through concrete examples.

The diversity of the speech communities studied by researchers using the ethnography of communication as a primary methodology can be inferred from this list of six book-length studies: *Kuna Ways of Speaking: An Ethnographic Perspective* (Sherzer, 1983); *Linguistic Convergence: An Ethnography of Speaking at Fort Chipewyan* (Scollon & Scollon, 1979); *Puerto-Rican Discourse: A Sociolinguistic Study of a New York Suburb* (Torres, 1997); *Literacy Practices in a Rural Community in Pakistan* (Farah, 1992); *Functions of Language in the Classroom* (Cazden, John, & Hymes, 1972); and *Changing Times, Changing Minds: Language Socialization in Hungarian English Schools* (Duff, 1993). For readers seeking further examples of the use of ethnography of communication as a research methodology, Philipsen and Carbaugh (1986) have published a bibliography of over two hundred studies employing the approach, and Saville-Troike also notes additional studies in her 2003 volume.

Hymes’s Theoretical Model

On a conceptual level, the ethnography of communication, as originally conceived by Hymes, proceeds from the assumption that conventionalized norms of language use within a speech community are inseparable from patterns of social action and social organization. Accordingly, in Hymes’s theoretical model, social life within a speech community is characterized by a distinctive pattern of “speech situations,” “speech events,” and “speech acts” that together comprise the communicative activities of the community. (As an example, consider the following: a retirement party with colleagues and friends—a speech situation; a conversation between the newly retired individual and a long-time work colleague—a speech event; and a compliment from the colleague regarding the retiree’s career accomplishments—a speech act.)

In its focus on the communicative functions performed by language, Hymes’s theoretical model resonates with the work of Roman Jakobson, John Austin, and John Searle. Hymes’s model is also clearly reminiscent of literary critic and rhetorician Kenneth Burke’s “dramatistic pentad”—comprising act, scene, agent, agency, and purpose—proposed by Burke as an analytical tool for examining discursive events. Hymes studied under Burke at Indiana University, and the two scholars subsequently maintained a decades-long correspondence and had a mutual influence on one another’s work. Hymes (2003) readily acknowledged his debt to Burke as an inspiration for his model of speech situations, speech events, and speech acts: “My sense of what I do probably owes more to Kenneth Burke than to anyone else” (p. x).

In an extension of his theoretical model of the speech community and its constituent elements, Hymes (1966, 1985) introduced the concept of “communicative competence”—playing off the distinction that Chomsky (1965) had earlier made between “linguistic competence” and “linguistic performance”—to describe what an individual needs to know and be capable of doing, both linguistically and in social relations, in order to communicate effectively within a particular speech community according to its local “ways of speaking.” Looking at language acquisition, Hymes (1972) describes what such communicative competence involves, using the experience of a child as an example:

We have to account for the fact that a normal child acquires knowledge of sentences not only as grammatical but also as appropriate. He or she acquires competence as to when to speak, when not, and as to what to talk about with whom, when, where and in what manner. In short, a child becomes able to accomplish a repertoire of speech acts, to take part in speech events, and to evaluate their accomplishment by others. This competence, moreover, is integral with attitudes, values, and motivations concerning language, its features and uses, and integral with competence for, and attitudes towards, the interrelation of language with the other code of communicative conduct [viz. social interaction]. (pp. 277–8)

In communicative competence, Hymes originated a concept that would be widely appropriated by researchers in language education from the late 1970s onward, particularly in the fields of second language and foreign-language teaching, reflecting the extensive use of the ethnography of communication in educational research (Duff, 2002). In what came to be known as the “communicative approach,” language learners are introduced very early in their course of instruction to the use of authentic language in the particular situations and social interactions in which they are ultimately aiming to participate, whether these situations and interactions occur in academic, workplace, or community settings—so that the end goal of language learning plays a central part in its means of achievement (Canale & Swain, 1980).

“Doing Ethnography”

For Hymes (2003), any credible general theory claiming to describe and explain the interaction of language and social life across speech communities must be derived from empirical field research within single communities: “Underlying the diversity of speech within communities . . . are systematic relations, relations that, just as grammatical and social structure, can be the object of empirical inquiry.” (p. 30) According to Hymes (1977), a researcher undertaking such inquiry should focus on

the local form of general properties of social life—patterns of role and status, rights and duties, differential command of resources, transmitted values, environmental constraints. [An ethnography] locates the local situation in space, time, and kind, and discovers its particular forms and center of gravity, as it were, for the maintenance of social order and the satisfaction of expressive impulse. (p. 25)

Muriel Saville-Troike (2003) provides a researcher intent on “doing ethnography” (p. 4) within a speech community with a broad initial question to consider: “What does a speaker need to know in order to communicate appropriately within [this] speech community, and how does he or she learn?” (p. 2) Proceeding from this starting point, the aspiring researcher can look to Hymes himself (1967) for a more detailed set of questions regarding the “ways of speaking” that organize communicative activities within the community:

What [forms of language] are used, where and when, among whom, and for what purpose and with what result, to say what, in what way; subject to what norms of interaction and of interpretation; as instances of what speech acts and genres of speaking? How do community and personal beliefs, values and practices impinge upon the use of language, and upon the acquisition of such language by children? (p. 8)

Narrowing the focus to specific communicative events occurring within a speech community, Hymes (1967) provides four additional questions for the researcher to investigate: "1. What are the communicative events, and their components, within a community? 2. What are the relationships among them? 3. What capabilities and states do they have, in general, and in particular events? 4. How do they work?" (p. 25).

In order to pursue these various questions within any given speech community, the researcher would need to conduct two kinds of inquiry—emic and etic. A significant part of the culture-specific knowledge needed to answer the questions mentioned above requires that the researcher gain an emic, or insider-like, perspective that can be achieved only through prolonged experience as a participant-observer within the speech community under study, with a year spent working in the community sometimes cited as a minimum duration (Saville-Troike, 2003). Depending on the researcher's status within the speech community and his or her access to a cross-section of reliable informants, the data to be gathered might include observational field notes, interviews with individuals in a range of different roles and social contexts, a collection of artistic and other material artifacts, as well as secondary published sources containing insider-supplied information on the history, demographics, and social organization of the group.

For the second kind of inquiry—conducted from an etic, or outsider, position—Hymes's (1972) model includes a set of sixteen factors that can be used to analyze a speech event: message form, message content, setting, scene, speaker, addressor, audience, addressee, purposes (goals), purposes (outcomes), key, channel, forms of speech, norms of interaction, norms of interpretation, and genres. To facilitate the researcher's work, Hymes offers an acronym for use as a mnemonic for identifying the various facets of a speech event: **SPEAKING**. Hymes lists eight such facets—**setting**, **participants**, **ends**, **act** sequences, **key**, **instrumentalities**, **norms**, and **genre**. Farah (1998) describes this heuristic in some detail:

(**S**) Setting including the time and place, physical aspects of the situation such as arrangement of furniture in the classroom; (**P**) participant identity including personal characteristics such as age and sex, social status, relationship with each other; (**E**) ends including the purpose of the event itself as well as the individual goals of the participants; (**A**) act, sequence or how speech acts are organized within a speech event and what topic/s are addressed; (**K**) key or the tone and manner in which something is said or written; (**I**) instrumentalities or the linguistic code i.e. language, dialect, variety and channel i.e. speech or writing; (**N**) norms or the standard socio-cultural rules of interaction and interpretation; and (**G**) genre or type of event such as lecture, poem, letter (p. 26).

Conclusion

For language researchers, a key aspect of the theoretical model underlying Hymes's ethnography of communication is its detailed description of the different elements comprising the sociocultural context of language use. While other theoretical representations of context have appeared over the years to rival Hymes's model as a conceptual tool for researchers wishing to explore the complex interrelationship between language and socio-cultural context within a particular social group—such as the discourse community (Bizzell, 1982), the community of practice (Lave & Wenger, 1991), and the activity system (Cole &

Engeström, 1993)—Hymes's notion of the speech community and its constituent features remains an important concept for qualitative language research. At the same time, the recognition of similarities across ethnographic accounts from geographically and culturally diverse field studies in individual speech communities by researchers using the ethnography of communication to study local patterns of relationship among language, social knowledge, and communal behavior continues to strengthen our general theoretical understanding of language-in-use and linguistic competence across cultures.

Ethnomethodology in the Analysis of Discourse and Interaction

ILKKA ARMINEN

Ethnomethodology is a branch of research that studies people's tacit, unacknowledged, taken-for-granted resources of social action, their common sense, and their interactional competence. According to its founder, Harold Garfinkel (1967, p. 1), the "central recommendation" of ethnomethodology "is that the activities whereby members produce and manage settings of organized everyday affairs are identical with members' procedures for making those settings 'account-able'"; that is, ethnomethodology assumes that the meaning of a social phenomenon is equivalent to the methodical procedures through which participants build and maintain its sense.

Accountability is the key concept of ethnomethodology (Heritage, 1984). Social actions and experiences are accountable; they can be recognized, identified, described, and characterized. Through this "accounting" of actions and experiences, they become regular and fall under the normative order. Hence, ethnomethodology proposes a bottom-up approach for the constitution of societies and cultures: The methods whereby people render and make their experiences accountable are the methods whereby they maintain the social order for which they are accountable. This "reflexive" and "incarnate" character of the production of social order inevitably makes people's everyday lives and their common sense a rich and profound topic for research.

Basic Assumptions

Ethnomethodology is founded on the topic/resource shift that allows the reservoir of everyday knowledge normally taken for granted to be opened up to research (Zimmerman & Pollner, 1970). The fundamentals of social action are made objects of study. Ethnomethodology aims at revealing the primary features of social actions by discovering their foundation in the situated practices at the face-to-face level. Social order is not given top-down, but something that participants work to achieve. Nor are meanings of language or social actions given, but context-bound, deriving from their context of production. Finally, rules and regularities are seen as resources for interpretations that guide the participants as sources of understanding, rather than external forces that mechanically compel actors. The idea is not to deny the existence of power relations, but to acknowledge that, whatever the social relationships are; they are subject to procedures and methods of reasoning. Ethnomethodology refuses to treat human beings as "judgmental dopes."

Ethnomethodology is (in)famous for the "breaching experiments" of Garfinkel (1967), in which he instructed an experimenter to behave in some ordinary situation in inappropriate and, by common standards, senseless ways. In the experiments, the subjects "vigorously sought to make the strange actions intelligible and to restore the situation to normal appearances" (Garfinkel, 1967, p. 47). These experiments demonstrated the participants' use of commonsense expectations, their accounting practices, and the resulting moral force of cognition. The demonstration of the moral force of the routine grounds of everyday life

2 ETHNOMETHODOLOGY IN ANALYSIS OF DISCOURSE & INTERACTION

explicated the procedures through which the normality of everyday life was achieved in the course of social interaction.

The ethnomethodological program can be summarized in four core assumptions (Arminen, 2005):

1. The meaning of a social phenomenon is equivalent to methods through which participants sustain its sense.
2. Language use is indexical, that is, it is bound to its context; there are no objective meanings.
3. The social order is the participants' methodic achievement; there is no transcendental basis for societies.
4. Rules and regularities are not natural laws but resources for interpretation for the participants.

The methodological implications of ethnomethodology include:

1. naturalism—studies should concentrate on real events, that is, the use of naturally occurring data is favored;
2. non-ironical stance—the participants' own actions and orientations are the source of meaning, and a researcher does not possess superior knowledge a priori; and
3. observational science—studies focus on what can be observed.

Theoretical Background

Garfinkel has told the following story about the origins of the idea of ethnomethodology:

In 1954 Fred Strodbeck was hired by the University of Chicago Law School to analyse tape-recordings of jury deliberations obtained from a bugged jury room. Edward Shils was on the committee that hired him. When Strodbeck proposed to administer Bales Interaction Process Analysis categories, Shils complained: "By using Bales Interaction Process Analysis I'm sure we'll learn what about a jury's deliberations makes them a small group. But we want to know what about their deliberations makes them a jury." (Garfinkel, Lynch, & Livingston, 1981, p. 133)

Subsequently, ethnomethodology developed a response to Shils's complaint. It began investigating the properties of reasoning and practical action that are the participants' ways of producing this particular activity (Garfinkel, 1967). From its onset ethnomethodology developed as a distinct alternative to standard scientific approaches that survey average properties of the phenomena. The aim of ethnomethodology is to catch the defining features, the "just whatness" of mundane activities that make them what they are; that is, what the methods, means, and procedures are through which an activity like jury deliberation is being done.

Originally, ethnomethodology was inspired by the phenomenology of Husserl and Schutz (Heritage, 1984); but it transposed their inquiries about the appearance of phenomena in the world onto studies of the members' methods of doing *being-in-the-world*. The range of ethnomethodological studies has been astonishing, covering topics from jazz improvisation (Sudnow, 1978), snitching (Wieder, 1974), and proving mathematical theorems (Livingston, 1986) to "doing being ordinary" (Sacks, 1992; for further studies, see Garfinkel, 2002). All of these studies have focused on the methods of *doing* things—if nothing else, *doing being ordinary*; how people manage to give an impression of being more-or-less like everybody else. Routine is seen not as a statistical average, but as a skilled achievement.

Ethnomethodological Study of Discursive Practices

Early ethnomethodology achieved the elevation of people's everyday practices and commonsense reasoning to research topics. It investigated practical activities in their own right, adopting a policy according to which "the features of socially organized activities are particular, contingent accomplishments of the production and recognition work of parties to the activity" (Zimmerman & Pollner, 1970, p. 94). Hence, the orderliness of discourse was seen as the situated accomplishment whose methodical nature could be explored. The under-analyzed properties of everyday reasoning that were taken for granted were to be shifted from unreflexive resources to the topics of study. Further, this program restrained the analyst from using *a priori* theorizing or any other external resources to explicate the nature of the activity in order "to sustain the sense of an objective structure of social activities" (Zimmerman & Pollner, 1970, p. 100), which is the participants' own achievement. On the face of it, this was a new, rigorous, and distinctive program for the study of discursive practices.

Classical ethnomethodological studies focused on various mundane matters such as the maintenance and breaches of trust, construction of gendered identities (e.g., the study of "transsexual Agnes"), and the filling in of bureaucratic forms (Garfinkel, 1967). In these classic studies, Garfinkel did not try to refute the existence of rules, norms, or regulations, but focused on the indispensable, ingenious, mundane practices through which rules, norms, and regulations were put into force in particular and context-dependent ways (Heritage, 1984). The topics of ethnomethodology vary, but are unified by their focus on the details of the accomplishment of discursive practice. It has developed into a program for the scrutiny of the foundational role of talk and interaction for discursive practices, in both everyday and institutional settings.

Schegloff and Sacks (1973) summarized well the perspective shared by all classical ethnomethodological studies:

We have proceeded under the assumption (an assumption borne out by our research) that in so far as the materials we worked with exhibited orderliness, they did so not only to us, indeed not in the first place for us, but for the co-participants who had produced them. If the materials (records of natural conversation) were orderly, they were so because they had been methodically produced by members of the society for one another, and it was a feature of the conversations we treated as data that they were produced so as to allow the display by the co-participants to each other of their orderliness, and to allow the participants to display to each other their analysis, appreciation and use of the orderliness. (p. 290)

Sacks and his colleagues initiated a research program that was to be called conversation analysis (CA). All ethnomethodological studies are directed to the mundane details of everyday life through which the social world in its multiplicity is formed. CA focuses on the foundational role of talk and interaction for social action. Originally, CA was an extension of the ethnomethodological paradigm of accountable action (Heritage, 1984). Interactants in conversation treat each other's behavior as normatively sanctionable, and the regulative patterns of talk-in-interaction become normatively constituted. Through this normative underpinning, talk-in-interaction becomes an institution in its own right, in which the interactants orient to the patterns of interaction as a normative standard that enables regular social interaction. CA treats interaction as a structurally orchestrated enterprise. Contributions in interaction are sequentially implicative: They delimit the range of possible next contributions by making some types of actions conditionally relevant. In this way, the context of interaction is endogenously constructed and becomes an orderly achievement. The participants orient themselves to this orderliness of interaction, and their

orientations provide the basis of the intersubjectivity of social action and the orderly course of interaction (ten Have, 1999; Arminen, 2005).

The emphasis on studying talk as a way of *doing* linked CA to ethnomethodological sociology (Garfinkel, 1967). Early ethnomethodology and CA shared also the presupposition that phenomena are properly investigated through observation and discursive reporting so that others can make use of these reports for further inference and action. As a whole, ethnomethodological studies of social interaction have established the existence of face-to-face behavior as an emergent social fact. Harvey Sacks coined the phrase “order-at-all-points,” which can be taken as the primary methodological principle of CA (Sacks, 1992). That is, social interaction may be approached as a systematically organized whole; even the smallest details should not a priori be seen as irrelevant. In this way, Sacks and his colleagues managed to establish a new, autonomous field of study (Schegloff & Sacks, 1973; Sacks, Schegloff, & Jefferson, 1974).

“Radical” Ethnomethodology

Later, in the 1970s, Garfinkel developed what has come to be known as “radical ethnomethodology.” This approach began within “studies of work” which sought to analyze the actual material practices that compose ongoing, situated, day-to-day work practices (Heritage, 1984). In all they promised a rigorous analysis of materialized competencies of work activities in real settings (Lynch, 1993). The themes of these studies include the achievement of teamwork, the role and uses of artifacts for work practices, and the spatial organization of the workplace. The studies have shown how the coordination of work is supported by artifacts such as procedural diagrams, maps, job descriptions, and project plans. Ethnomethodological studies have helped to acknowledge the relevance and constitutive role of semiotic resources and spatial arrangement of the workplace for the organization of activities.

The program of studies of work later led to social studies of science in a form of laboratory ethnography (Garfinkel et al., 1981; Lynch, 1993). In another direction, Lucy Suchman’s (1987) exposition of the problem of human–machine communication formed the bedrock for a wide spectrum of studies that address human–computer interaction and computer-supported cooperation. Ethnomethodology has proven to be useful for laying out basic properties of human–computer interaction that promise insights for the design of information technology. Dourish and Button (1998) have investigated the possibilities of approaching system design from the ethnomethodological perspective. They seek to establish for ethnomethodology “a foundational place in the very notion of system design, rather than simply being employed as a resource in aspects of the process, such as requirements elicitation and specification” (Dourish & Button, 1998, p. 395). Among others, they have introduced the notion of accountability for systems designers. This could be used for reprogramming by revealing what became invisible in the initial programming. In all, ethnomethodology has regained a prominent position in science and technology studies, which has also had a profound impact on research methods, reflected in Latour’s (1986) ironic remark: “Will the last person to leave the social studies of science please turn on the tape-recorder?”

Recently, workplace studies and anthropological studies of practices have increasingly drawn on a combination of methods from CA, ethnomethodology, and ethnography (Suchman, 1987; Goodwin, 1994; Heath & Luff, 2000). Both workplace studies and anthropological studies of practices have tried to develop a perspective from which to investigate discursive practice as situated accomplishment that emerges from its practical management within language, social configuration, and material resources (Goodwin, 1994; Heath & Luff, 2000; Arminen, 2005). These approaches have adopted aspects of activity theory to

address social actions more distinctly, and not to prioritize verbal communication. As a whole, talk and other actions are in a reciprocal relationship; they facilitate each other in accomplishing the task they are contributing to. It is the coordination of talk and action, not talk as such, that establishes the sense of the ongoing action (Goodwin, 1994).

Future Prospects

This new synthesis of CA, ethnomethodology, and ethnography promises to fulfill the original promise of ethnomethodology to invigorate our understanding of discursive practices and revive Sacks's original vision of the science of social life (Sacks, 1992). The resulting approach can lead to studies of discursive practices that increase our understanding of day-to-day social practices by re-specifying their interactional substratum. The emerging ethnomethodological social science can contribute to our grasp of the diversity of discursive practices.

Initially, Sacks contemplated the idea of a science of social life that would analyze the practices that permit people to see and feel the way they do (Sacks, 1992; Arminen, 2005). Starting from Garfinkel's original idea of ethnomethodology, the goal was to be retrieved from what-everybody-knows: The elementary properties of discursive practices that compose the taken-for-granted basis for ways of life were to be explored (Sacks, 1992; Silverman, 1998). The idea was to grasp the relevant details of actions to "reverse engineer" the foundations of societal life. As such, Sacks did not aim to narrow down the scope of research to the level of interaction only. In fact, he became interested in conversations only incidentally, because the ease of recording allowed access to actual reproductions of lived life that were critical for the scientific study of social life (Sacks, 1992).

More recent studies of interaction which make use of video recording unite the analysis of verbal and physical action in their activity context. Moreover, ethnographic materials provide a background understanding for a more detailed scrutiny of videotaped (inter)actions. Ideally, the use of multiple data sources opens a hermeneutic circle in which the details of (inter)action are interpreted vis-à-vis their ethnographic context, the sense of which is clarified by reference to the actual interaction. Video recordings provide an opportunity to test the validity of ethnographic insights by providing reportable evidence of instances of the phenomena studied. The production and coordination of social action in real time through talk and visual conduct are inspected by combining videotapes with the study of spoken interaction so that the mutual constitution of talk and action is revealed. Talk is studied with the help of CA transcription conventions and methods, and visual actions are inspected along with the stream of speech, which discloses the sequential flow of activities as an organized whole.

Explicit Knowledge and Grammar Explanation in Second Language Instruction

ROSEMARY ERLAM

What Is Explicit Knowledge and Why Is It Important?

Explicit knowledge is knowledge that a learner has *about* a language and that he or she is conscious of and able to report in some way (Ellis, 2008). For example, many learners know and can explain that in English you need an 's' on verbs when you use them with a subject such as *he, she, or John* to talk about something in the present. There has, in the past, been disagreement over whether helping learners develop explicit knowledge helps them acquire language: Krashen (1981) famously suggested that it didn't. More recently, however, a growing body of research evidence suggests that helping learners develop explicit knowledge may speed up language acquisition (Ellis, 2008) even if it doesn't alter the course of it. In their meta-analysis Norris and Ortega (2000) presented evidence to show that instruction that encourages the development of explicit knowledge makes a significant difference to language learning outcomes that is unlikely to be attributable to chance. In answering the question of how explicit knowledge may help acquisition we need to acknowledge the significant role that has been given to attention in second language learning ever since Schmidt (1990) proposed his noticing hypothesis. Schmidt's proposal that learners will only learn what they pay attention to suggested a rationale for drawing learners' attention to specific language features. Further support for the importance of developing explicit knowledge comes from skill acquisition theory, which argues that second language learning starts with an explicit representation of linguistic forms and that this explicit representation provides a basis for the implicit learning that follows (DeKeyser, 2007).

Grammar Explanation Is One Way of Building Explicit Knowledge

There are a number of ways of helping learners develop explicit knowledge, often referred to as different ways of having a focus on language form. Ways of encouraging learners to focus on form can vary in terms of how explicit and implicit they are. For example, at the implicit end of the continuum we have a technique such as input flood, where learners are exposed to lots of examples of specific language features but their attention is not otherwise explicitly drawn to these. Grammar explanation belongs more to the explicit end of the continuum, because learners are explicitly told about the workings of a form, a function, or both, and encouraged to attend to the specific linguistic features, and to try to understand them. However, as we will see below, grammar explanation can vary too along a continuum in terms of how explicit it is.

In the remainder of this entry, I will distinguish grammar explanation from grammar practice in much the same way that Hedge (2000) differentiates between “presenting and explaining grammar” and “grammar practice activities.” In other words, I will assume that grammar explanation aims to help students develop *understanding* of specific grammatical features, whereas grammar practice aims to help them produce or perform these features correctly.

What Is Grammar Explanation?

For many, the idea of grammar explanation will evoke the notion of grammar rules. Traditionally, explicit methods of grammar instruction tended to be limited to explanations of rules followed by opportunities to complete activities illustrating these rules. This was most evident in the PPP model (i.e., present, practice, produce) widely promoted in teacher handbooks (Ur, 1996; Hedge, 2000). Today, the value of rules in helping learners understand how language works is acknowledged, although research has suggested some caveats. Green and Hecht (1992) showed that German learners of L2 English did not know grammar rules they had been taught, but not knowing rules did not mean that they were unable to recognize and correct mistakes in English. They concluded that being taught rules may help learners along the way to language learning, that is, help them acquire language, but that learners may outgrow a dependence on rules.

While presenting grammar rules is certainly one type of grammar explanation it is, nonetheless, not the only way of explaining grammar. Other ways of helping students understand how language structures “work” in the L2, include, but are not limited to (Simard & Jean, *in press*),

- sentence analysis—using arrows or color and so forth to show the relationship between different components of a sentence;
- contrastive analysis—comparing language features in the L1 and the L2 or with another L2;
- translation;
- giving learners conjugations or declensions, or presenting other language features paradigmatically (e.g., in a chart or table);
- syntactic manipulation—manipulating specific constituents of a phrase or sentence, for example turning a declarative sentence into an interrogative;
- labeling or classifying components of a phrase or sentence.

Some of these approaches to explaining grammar (and the last is a case in point) may involve familiarizing learners with metalingual knowledge, that is, the knowledge of technical terms used to describe language (e.g., noun, transitive verb, etc.). However, explicit knowledge of a language does not necessarily require knowledge of the metalanguage that is used to describe it. Learners can be given explanations in simple, nontechnical language, and indeed there is some evidence to suggest that this is how they may best remember them (Elder, Erlam, & Philp, 2007).

Another approach to grammar explanation is Lantolf’s (2007) concept-based approach. Lantolf queries the quality of grammar explanations often given to learners, complaining that they are piecemeal, rather than coherent, and theoretically informed. In his concept-based approach learners are given grammatical explanations and then encouraged to verbalize their understanding of what they have learned. In this way learning becomes visible and incomplete learning can be modified through feedback until the learner demonstrates that she or he has formed a deep understanding of the relevant grammatical concepts.

A Deductive or Inductive Approach to Grammar Explanation

In a deductive approach to grammar explanation, students are given explicit information about a particular target structure, usually prior to language practice activities. Processing instruction (VanPatten, 2004) is an example. In processing instruction, the language structure targeted is one that has been demonstrated to present input-processing difficulties for students. Students are given information about the structure, including information about why it is difficult for them to process it; they then work at structured input activities which help them process the structure correctly.

In an inductive approach, which is more implicit, students are given examples of the target structure in context and encouraged to form hypotheses and conclusions about it themselves. This may be followed by an explanation or a rule given by the teacher, but may not. One example of an inductive approach to grammar explanation is “consciousness-raising” (Ellis, 2002). A consciousness-raising activity isolates a specific linguistic feature for learners to attend to, provides them with data which illustrate this feature, and encourages them to use intellectual effort to understand it.

While many textbooks still present foreign language grammar explanations deductively, Haight, Herron, and Cole (2007) argue in favor of “guided induction,” where the instructor and learners construct together an understanding of a particular language structure through a series of student–instructor interactions. Haight et al. claim that this approach is supported by a sociocultural and constructivist theory of learning (Lantolf, 2000). They tested this approach with L2 learners of French who were taught eight target structures, some through a guided induction approach, and some through a deductive approach. Results showed that the guided inductive instructional approach led to gains that were statistically significantly better than the deductive instructional approach. The researchers conclude that these findings accord with cognitive theories of learning which see learning as involving problem solving and engagement on the part of the learner.

One of the difficulties in drawing conclusions from the research about the effectiveness of these two approaches to grammar explanation is that inductive instruction has been carried out in different ways in studies looking at its effectiveness (Erlam, 2003). For Herron and Tomasello (1992) a potential problem with inductive instruction is that there is no guarantee that the learner will “induce” the underlying grammatical concepts correctly. One way of dealing with this problem is to check the understandings that learners have derived and to correct any misunderstandings.

Other Options for Grammar Explanation

Options for how grammar explanation may be implemented present choices in terms of preparation, timing, motivation, and context. First, grammar explanation can be either planned or unplanned. In the former option there has been some advance preparation for the grammar focus, while in the latter instance it may be that the teacher decides, without prior forethought, to briefly take time out from a particular activity in order to deal with an error that he or she has noted during the lesson. Second, grammar explanation can vary in terms of its timing in relation to a classroom activity or task, that is, it can be either preemptive or reactive. In the former, the teacher may anticipate knowledge that students will need to complete a particular task or activity and incorporate a focus on this *before* the task is undertaken. A reactive explanation may be given *after* a particular task, perhaps in response to errors that the teacher has observed. Research has shown that corrective feedback that includes grammar explanation and that is given in reaction to students’ errors can be effective for learning (Ellis, 2008). Third, grammar explanation can be

motivated either by students (student initiated) or by the teacher (teacher initiated). In the former it is most likely that a student asks a question that leads to a subsequent explanation whilst in the latter it is the teacher who decides that the explanation is necessary. Lastly, grammar explanation may be integrated or isolated (Spada & Lightbown, 2008). In the former, a focus on the target structure takes place in context, for example, in a communicative activity where the focus is on meaning. In the latter the preselected linguistic forms that are the focus of the instruction are presented out of context. Research evidence increasingly suggests that a focus on linguistic form in a context where students are engaged in using language as a tool to communicate is more effective. Indeed there is evidence to suggest that it may not be the grammar explanation per se that is most effective for learning, but the opportunity for learners to attend to language forms, and to associate them with the meanings they convey (VanPatten & Oikennon, 1996). In other words, grammar explanation may be effective because it focuses learners' attention on linguistic features and helps them make form–meaning mappings.

It is important to recognize that these options with regard to grammar explanation are not mutually exclusive but may overlap with each other. For example, grammar explanation may be unplanned, reactive, and integrated.

Factors That May Determine Choices in Grammar Explanation

There is some evidence to suggest that grammar explanation (in particular the more explicit forms) may be more effective for adolescents and older learners who are more academically and cognitively mature than for younger children who haven't yet developed analytic skills. Younger children may learn more implicitly and be less able to benefit from an explicit focus on language structure. Another factor to consider is learner aptitude. Some learners have high language analytic ability and are better able to infer grammar rules or make linguistic generalizations than others. There is tentative research evidence to suggest that learners who have high language analytic ability may be more able to benefit from an inductive approach to grammar explanation because they are more skilled at hypothesis testing. Other learners may do better with a more deductive approach (Erlam, 2005).

Conclusion

In conclusion, when it comes to helping learners develop explicit knowledge through grammar explanation, it is important to remember that one size does not fit all. A differentiated approach to grammar instruction may well be one that works best. It may sometimes be appropriate to use a deductive approach, at other times an inductive approach. At times it may be appropriate to give a rule, at other times some other form of grammar explanation may be more suitable.

Explicit Learning in Second Language Acquisition

CARMEN MUÑOZ

An introduction to explicit learning needs to refer to implicit learning as well, either as the other extreme of a dichotomy or of a continuum. Reber (2003, p. 488) notes that the tendency to view the implicit–explicit issue in an either/or framework is almost certainly a mistake: “Virtually everything cognitively interesting that people do is a complex blend of consciously controlled processing that is declarative in nature and implicit, automatic functioning that lies largely outside of awareness.” With this initial cautionary note, the following paragraphs provide an introductory presentation of explicit learning, and related concepts from cognitive psychology. This introduction then focuses on the role of explicit learning in second language acquisition (SLA), and ends with a reference to the role of explicit learning in the explanation of age-related differences in second language (L2) learning.

Following N. Ellis (1994, p. 1) explicit learning is a “conscious operation where the individual makes and tests hypotheses in a search for structure.” This contrasts with his definition of implicit learning as “acquisition of knowledge about the underlying structure of a complex stimulus environment by a process which takes place naturally, simply and without conscious operations.” Though there is still significant debate concerning the explicit–implicit issue, it may be claimed that the crucial difference between explicit and implicit learning is consciousness of the structure being learned or lack of it, respectively. Explicit learning is also associated with effortful processing whereas implicit learning is associated with automatic processing. In addition, there exists strong evidence that explicit and implicit learning are subsumed by different neuroanatomical structures.

Reber (2003) notes that the link with conscious control explains that explicit systems are relatively recent arrivals on the evolutionary arena, more recent than implicit systems, which function procedurally and largely independent of top-down control. Because explicit systems are recently evolved, they are less robust in the face of disorders and dysfunctions than implicit systems, which are older and form the foundation for later developments. Thus, explicit cognitive functions are severely impaired in a large number of psychiatric and neurological disorders, while implicit learning and implicit memory processes remain intact. Likewise in aging populations, implicit processing is almost intact while consciously controlled cognitive functions begin to decline as seen in explicit tasks (such as problem solving, reasoning, and long-term memory).

A number of concepts related to explicit and implicit learning need to be distinguished from one another, namely explicit and implicit knowledge, declarative and procedural knowledge, and explicit and implicit memory. Explicit and implicit knowledge are to be seen as the product of the process of learning (Schmidt, 1994). A term used sometimes as a synonym for explicit knowledge is declarative knowledge. Declarative knowledge is knowledge “that” something is, in contrast to procedural knowledge that is knowledge “how” to do something. Explicit memory is memory of a past event with conscious awareness, whereas implicit memory is memory with no awareness. Different types of evidence make clear the dissociation between explicit and implicit memory. Patients suffering from

retrograde amnesia perform very poorly on explicit tasks but their implicit memory processes remain intact. On the other hand, patients with aphasia have impaired implicit memory for language (or of its automatic use) without loss of explicit knowledge. In the brain, explicit memories are claimed to engage various areas of the neocortex (especially the frontal and temporal lobes) as well as the hippocampus, whereas implicit memories are claimed to reside in different regions of the neocortex and not to be subserved by the hippocampus (Paradis, 1994).

Explicit Learning in a Second Language

The explicit-implicit distinction is often referred to as the learning-acquisition distinction in the field of SLA (e.g., Krashen, 1985, 1994). It has generated essential theoretical debate with important pedagogical implications, namely, whereas there is general agreement that much of L1 acquisition reflects implicit learning, no such consensus exists as for the role of implicit and explicit learning in L2 acquisition. As in cognitive psychology, in the L2 literature on explicit and implicit learning the defining feature is awareness of what is being learned or lack of it. Hulstijn's (2005, p. 131) definition of explicit learning is a good illustration: "Explicit learning is input processing with the conscious intention to find out whether the input information contains regularities and, if so, to work out the concepts and rules with which these regularities can be captured."

An important issue in the explicit-implicit discussion relates to the differential effectiveness of explicit and implicit learning as a function of the nature of the element of the grammar to be learned (DeKeyser, 2003). It has been argued that for complex structures that are hard to learn explicitly, implicit learning is advantageous (e.g., Reber, 1993; Krashen, 1994; Robinson, 1996). It has also been suggested that there may be different degrees of usefulness of explicit teaching for different levels of difficulty. Thus, when the rule is easy, instruction can speed up the explicit learning process and when the rule is difficult, instruction may enhance later implicit acquisition by increasing the chances of noticing. However, rule difficulty is an individual issue and it is subject to factors such as an individual's language learning aptitude or language learning experience. As for the objective difficulty of the rule itself, a number of factors seem to play a role besides its complexity, among them salience, novelty, abstractness, subset-superset relationships, scope and reliability of the rule, semantic redundancy, and the possibility of item learning (see Hulstijn & de Graaff, 1994; Hulstijn, 1995). In this respect, DeKeyser (2003, p. 334) concludes that "the harder it is to learn something through simple association, because it is too abstract, too distant, too rare, too unreliable, or too hard to notice, the more important explicit learning processes become." Relatedly, Hulstijn (2005) discusses three factors whose interaction may affect the feasibility of explicit and implicit learning modes: (a) the regularity and complexity of the system underlying the data (the more regular and simple the more suitable for explicit learning); (b) the frequency and salience with which learners are exposed (the more salient and infrequent the more suitable for an explicit learning mode); and (c) learners' individual differences in knowledge, skills, and information processing styles (previously acquired metalinguistic knowledge and metacognitive problem-solving strategies may facilitate the use of explicit learning).

In general, studies in SLA have sought to infer the kind of learning that has taken place, explicit or implicit, by examining the products of learning, that is, explicit or implicit knowledge (R. Ellis, 2009a). In contrast to implicit knowledge, explicit knowledge is verbalizable, but verbalizing a rule or feature need not entail the use of metalanguage. DeKeyser (2009) distinguishes three different meanings or layers of "metalinguistic knowledge." The first is simply the awareness of what is right or wrong in a given sentence, without necessarily knowing why. This kind of knowledge can be implicit. The second

layer is metacognitive knowledge about one's linguistic behavior, and this sense corresponds to explicit. The third refers to the knowledge of language about language, that is, the ability to verbalize for which explicit knowledge is a necessary but not a sufficient condition.

An issue of both theoretical and pedagogical relevance is the measurement of explicit and implicit knowledge. The difficulty of measuring explicit and implicit knowledge arises from the problems involved in operationalizing concepts such as awareness and verbalization, and it is aggravated by the fact that the explicit-implicit distinction might be better represented as a continuum rather than a dichotomy. However, measuring explicit knowledge may be easier than measuring implicit knowledge. R. Ellis and his colleagues have worked on the development of tests to measure explicit and implicit knowledge. In their research project explicit knowledge is conceptualized as involving primarily analyzed knowledge (i.e., structured knowledge of which learners are consciously aware) and secondarily as "metalanguage" (in the sense of knowledge of technical terms). The operationalization of the explicit and implicit knowledge constructs draws on seven criterial features: (a) degree of awareness, that can be measured by asking learners to respond retrospectively whether they made use of "rule" or "feel" in responding to a task; (b) time available, which leads to distinguish between tasks that are performed without any time pressure or tasks that are time-pressured and consequently demanding on learners' short-term memories; (c) focus of attention, whether the task prioritizes accuracy or fluency; (d) systematicity, whether learners are variable or consistent in their response to a task; (e) certainty, assuming that maybe learners are less confident in their responses to a task that draws on explicit knowledge; (f) metalanguage, that will be related to learners' explicit (analyzed) knowledge; and (g) learnability, that assumes higher levels of explicit knowledge than of implicit knowledge in learners who began learning the L2 as adolescents or adults (R. Ellis, 2009b, pp. 38–9). In short, the tasks used to measure explicit knowledge in their studies have two main characteristics: they need to be performed without any time pressure and they need to involve explicit declarative facts that a person knows about language. By means of a factor analysis, R. Ellis and his colleagues were able to show that two factors, which they assumed to correspond to explicit and implicit knowledge, underlie the different tests used (e.g., explicit knowledge underlies metalinguistic knowledge tests and implicit knowledge underlies elicited oral imitation tests).

A problematic aspect of explicit learning is the gap existing between learners' explicit knowledge and use, which DeKeyser (2009) interprets as a gap between, on the one hand, insufficiently proceduralized/automatized explicit knowledge and, on the other hand, very limited implicit or automatized knowledge or both. This is observed, for example, when learners can verbalize a rule and yet they do not apply it in spontaneous unmonitored speech. Krashen (e.g., 1985) uses this to argue that what has been *learned* explicitly can never lead to implicit (*acquired*) knowledge that is ready for fluent use. In Krashen's view L2 instruction should only provide comprehensible input, that is, opportunities for implicit acquisition. As for explicit learning, it plays a role only in L2 production through monitoring. Krashen's distinction between "learning" and "acquisition" separates explicit and implicit learning in a way that has come to be known as the noninterface position. In contrast, a direct interface is argued for by those who consider that explicit knowledge can be converted into implicit knowledge through practice. In between these two extremes, weak interface positions are suggested that assume a less direct causality. One version of this intermediate position argues that explicit knowledge can contribute indirectly to the acquisition of implicit knowledge by promoting some of the processes that are believed to be responsible for it, such as "noticing" or "noticing the gap" between the input and the learner's existing linguistic competence, that is, facilitating attention to form in the input (see R. Ellis, 2009a). The most recent formulation of DeKeyser's strong interface position may arguably be considered also a weaker version. According to DeKeyser (2009, pp. 126–7),

4 EXPLICIT LEARNING IN SECOND LANGUAGE ACQUISITION

explicit knowledge does not turn into implicit knowledge in the sense that the more there is of one kind, the less there is of the other:

What it means is that the presence of one is conducive to, or plays a causal role in the development of the other . . . [and] while explicit learning certainly does not necessarily lead to eventual automatized, let alone implicit, knowledge, the likelihood of learners achieving a fairly high degree of automaticity in their use of a structure keeps evolving in parallel with their declarative knowledge about that structure.

Another distinction that needs to be made is that between explicit learning and explicit instruction. Explicit instruction does not necessarily lead to explicit learning (and neither does implicit instruction necessarily result in implicit learning). An instructional treatment is considered explicit when rules are explained to learners (deduction) or when learners are directed to attend to forms and arrive at rules (induction) (DeKeyser, 1995). Conversely, an instructional treatment is considered implicit when neither presentation of rules nor instructions to attend to forms are part of the treatment. Both laboratory studies and classroom studies that have compared explicit and implicit instructional treatments have shown an advantage for explicit instruction. In laboratory experiments this advantage is slightly stronger for deductive learning conditions than for inductive learning conditions (Robinson, 1996). A problem noted by DeKeyser (2003), however, is that these studies are of rather short duration, which benefits explicit learning since implicit learning is slow. Only a handful of classroom studies have compared otherwise identical implicit and explicit instructional treatments. In this case also the scant evidence shows an advantage for explicit instruction. Norris and Ortega (2000) carried out a review and meta-analysis comparing explicit and implicit instructional treatments. The results of their analysis suggest that explicit instruction is more effective than implicit instruction, although several problems have been pointed out with this conclusion. For example, many of the studies relied on methods of measuring acquisition that favored explicit instruction (see Doughty, 2003). In fact, this is an area in which no consensus exists, and while there is evidence in the literature pointing to a positive role for attention to form, there is a dearth of research into the role of attentional focus within implicit learning. Recent research has focused on the effectiveness of different kinds of feedback (more explicit or more implicit), and has pointed to the importance of the explicitness of feedback in helping learners to notice and learn explicitly (e.g., Lyster, 2004; Mackey, 2006).

Explicit Learning and Age-Related Differences

The distinction between explicit and implicit learning has been associated with the issue of the differential success of child and adult L2 acquisition. Two findings in the area of age-related studies are relevant to the discussion of the role of explicit learning in SLA. First, it has been observed that older learners are faster during the initial stages of L2 acquisition, particularly at learning morphosyntactic features, both in informal and in formal language learning contexts (Krashen, Long, & Scarcella, 1979). The superior efficiency of older learners is seen as related to their superior verbal analytical abilities. Older learners' use of "top-down" analytical procedures makes explicit learning tasks, such as problem solving or reasoning, easier (Muñoz, 2006). In contrast, younger learners are usually observed to reach higher levels of proficiency, often near-native or native-like levels of proficiency in the L2. This has been ascribed to their using implicit learning mechanisms, which are "bottom-up" systems (DeKeyser, 2000). These systems are slower at first but, as in first language acquisition, lead to successful acquisition through gradually inducing the underlying structure of the various structured components of language.

The second finding is concerned with differences in long-term attainment observed in the results obtained in foreign-language learning contexts relative to the results obtained in informal or naturalistic learning contexts. In the latter, naturalistic language learners who are younger when they begin learning the L2 generally reach near-native levels of proficiency. In foreign-language learning settings younger starters have not been observed to reach higher levels of proficiency than older starters after the same amount of instruction. Muñoz (2008) has suggested that young learners may not be able to make use of implicit learning mechanisms in foreign language settings because the input they are provided with may not be sufficient for them to pick up patterns and induce the underlying structure. In such contexts older learners may still use their superior analytical procedures and benefit from form-focused explicit instruction, which would explain their relative superiority. In the long term, when learners who started at a younger age can also benefit from explicit learning mechanisms, differences due to starting age of learning may disappear and other factors, both intrinsic (e.g., individual differences in language learning aptitude and learners' motivational orientations) and extrinsic (type and amount of contact with the target language) may play a greater role.

Exporting Applied Linguistics Technology

BRIAN BUDGELL

Introduction

Applied linguistics has the ability to solve important real-world problems, and in this entry we examine one such instance: the application of the technologies of corpus linguistics to facilitate inter-professional and intra-professional written communications in the domain of biomedicine and health. The problem facing this domain may be stated very simply as follows: Most stakeholders operating in the domain of biomedicine and health are not sufficiently fluent in the lingua franca of the domain—biomedical English—to perform at their best level. This means that education, research, clinical practice, and health policy formulation and implementation are all weakened (e.g., Egener, 2008). All of this seems counterintuitive, since the average person assumes that clinicians and researchers are highly educated and therefore fluent in their own working language. The truth, however, is that many health professionals and scientists are obliged to work in a second language—English—in which they are not particularly adept. The end result of this compromised fluency is likely to be less effective health care which translates into economic inefficiencies, and unnecessary suffering and death. There are many good examples of poor communications having catastrophic effects on quality of care (e.g., Rinke, Shore, Morlock, Hicks, & Miller, 2007; Velo & Minuz, 2009). Particularly since the 1980s, this has spurred concern for accuracy, completeness, and transparency in reporting of research findings as manifested in manuscript content guidelines (see www.equator-network.org). However, until very recently the involved professions have not been particularly introspective where written language skills are concerned.

Therefore, in this entry, we will examine how the methods of corpus linguistics have been used to:

- define the written languages of biomedicine and health;
- develop a fair, valid, reliable, and sensitive instrument to assess fluency in the written languages of biomedicine and health; and
- develop learning resources to facilitate fluency in the written languages of biomedicine and health.

Much of the research and developmental work described herein has been conducted under the auspices of the Centre for Biomedical and Health Linguistics, and the various learning and assessment tools described in this entry can be accessed on their Web site at www.bmhlinguistics.org.

Defining the Languages of Biomedicine and Health

Many would argue that biomedical English has established itself as the international lingua franca for the domain of biomedicine and health. Even in countries where English

The Encyclopedia of Applied Linguistics, Edited by Carol A. Chapelle.

DOI: 10.1002/9781405198431.wbeal0406

is not a national language, English is often the language of instruction for post-secondary courses in the biosciences and especially in the health sciences. Furthermore, biomedical researchers are encouraged to publish their studies in English-language journals, as these are likely to have a considerably higher impact factor (a numerical rating of importance) than journals published in some other language (Mueller, Murali, Cha, Erwin, & Ghosh, 2006). As a consequence, it is now said that most authors publishing English-language articles in biomedicine and health are not native English speakers. Indeed, a number of non-English-speaking countries are concerned about a “hollowing out” of biomedical and health knowledge in their own languages, and see this as an injustice which requires countermeasures.

The imperative of studying and publishing in English therefore places a considerable burden on a great many members of the community of biomedicine and health. Furthermore, even though these community members may have attained certification (e.g., Test of English as a Foreign Language or International English Language Testing System) of competence in general or academic English, they often struggle in their post-secondary studies, and in their efforts as researchers to publish findings which could improve our collective understanding of human health.

The incongruence between written general English and written biomedical English is readily apparent, and it has been argued that the differences are sufficient to justify removing the reference to “English” and instead using a term such as “biomedical language” (Budgell, Miyazaki, O’Brien, Perkins, & Tanaka, 2007a). One naturally expects that biomedical language would have its own esoteric lexicon. However, only recently have efforts been made to quantify lexical features of biomedical language. These studies confirm that General Service List (GSL) words (the 2,000 most commonly occurring word families in English) and the Academic Word List (AWL) words (the 570 word families commonly encountered in academic settings) make up the majority of words found within biomedical journal articles. English-language programs focus on these words, and so most learners are quite familiar with them before entering post-secondary studies. However, the GSL and AWL words alone are insufficient to provide fluency in the literature of biomedicine and health. It has been estimated that one needs to be familiar with the meanings of approximately 95% of the words on a page in order to be able to read fluently and to infer the meanings of unknown words (Hirsh & Nation, 1992; Laufer, 1992). So-called “off-list” words, words which belong to neither the GSL nor the AWL, generally make up in excess of 15% of words in biomedical texts. Consequently, learners need to know the meanings of some proportion of these off-list words in order to achieve 95% coverage. Analyses of corpora of professional journals in nursing (Budgell, Miyazaki, O’Brien, Perkins, & Tanaka, 2007b), public health (Millar & Budgell, 2008), and midwifery (Chiba, Millar, & Budgell, 2010) have permitted the identification of key words within the professional literature of each one of these fields. More specifically, specialized software can perform a statistical comparison of word frequencies to determine which words occur significantly more often in the biomedical realm than in general English. Thus, not only do we confirm our intuitive sense that biomedical language is different from general English, but we know quite precisely how it differs in terms of vocabulary, and this, of course, allows language learners to focus their efforts on those key words which occur most often.

In addition to lexical differences, we also see differences in grammatical conventions, for example that the passive voice is overrepresented in biomedical literature in comparison to general English. However, readability, as measured by scales such as Flesch Reading Ease, is not that challenging (Budgell et al., 2007b; Millar et al., 2008; Chiba et al., 2009). Collectively, these findings suggest that acquisition of biomedical language could be greatly facilitated by focusing learning strategies on key words, commonly recurring phrases, and the more commonly encountered grammatical patterns.

Developing a Fair, Valid, Reliable, and Sensitive Instrument to Assess Fluency in the Languages of Biomedicine and Health

A number of tools now exist to assess communicative competence in general English and in some specialized domains such as business. However, there is no widely accepted instrument for measuring fluency in the languages of biomedicine and health.

The development of corpora of various domains in biomedicine and health does permit the formulation of test items which are specific to the lexicons of these domains, and it is possible to identify patterns of usage and grammatical conventions which are overrepresented and therefore likely to be of particular importance in biomedicine and health.

Using this approach, a Test of English for bioMedical Purposes (TEbMP) has been developed and piloted with health sciences students in Australia, China, Japan, and Malaysia. Applying item response theory, questions have been screened to eliminate test items of inappropriate difficulty or poor sensitivity—questions which were either much too easy or much too difficult for the majority of test takers, and questions which failed to reliably distinguish between test takers with different levels of ability. On this basis it has been possible to assemble a bank of questions which reliably discriminate between test takers with higher and lower levels of communicative competence (Periera & Budgell, 2007; Perkins, Budgell, Miyazaki, O'Brien, & Tanaka, 2007). Figure 1 illustrates representative results from

Figure 1 Mean score and 95% confidence intervals of different cohorts on a 25-question version of TEbMP

a pilot exam of only 25 previously validated questions testing vocabulary, grammar, and usage. The histograms represent normalized scores and the error bars represent 95% confidence intervals. The figure demonstrates that Japanese medical doctors enrolled in a master's program for clinical research (cohort 1) have a marginally better grasp of biomedical language than first year students in an Australian sports therapy program (cohort 5). However, both of these cohorts performed better than first year Japanese medical students (cohort 2), and much better than first year Japanese nursing (cohort 3) or physiotherapy students (cohort 4). These results are both logical, based on prior language education, and congruent with the verbal skills demonstrated by these groups. Thus a very brief examination can discriminate quite effectively between candidates with different levels of fluency in biomedical language.

Work on the TEbMP question bank continues with collaborators in Asia, Australia, Europe, and North America, with a view to developing an assessment system which would have international portability and would reflect real-world abilities in the working language(s) of the biomedicine and health community.

Developing Learning Resources to Facilitate Fluency in the Languages of Biomedicine and Health

It is self-evident that identifying a target language will make acquisition that much more efficient. The corpora of biomedicine and health which have been developed so far allow learners and faculty to identify key words which learners are most likely to encounter in their studies. As described above, it is accepted that one needs to understand approximately 95% of the words within a text in order to be able to read fluently. For reading in general English, this translates into knowledge of approximately 15,000 words—a formidable challenge for someone learning a second language. Intuition might lead one to predict that an even larger vocabulary is necessary for fluency in a biomedical specialty, but this turns out not to be the case. Figure 2 illustrates, using the example of midwifery, how much more efficient vocabulary acquisition can become using an informed, targeted approach. With only the 2,000 GSL word families and the 570 word families of the AWL, a reader would

Figure 2 Percentage coverage of the corpus of midwifery and perinatal care (MPC) versus supplementation of GSL and AWL with off-list words

have approximately 86% coverage of midwifery texts. With the addition of a mere 242 off-list key words, this rises to approximately 90% coverage, and as few as 1,000 off-list key words provide 95% coverage—the threshold for reading fluency. Thereafter, the addition of another 1,000 or 2,000 off-list words only provides incremental increases in coverage. Thus, focusing on highly prevalent key words within one's specialty can reduce to a fraction the time and effort required to achieve functional reading literacy.

Corpora and key-word lists are now available for nursing, public health, midwifery, chiropractic, and acupuncture, and are being incorporated into language learning programs at a number of institutions. Corpora of randomized controlled clinical trials, meta-analyses and systematic reviews, and the neurosciences are also at different stages of development and analysis.

Beyond lexical research, biomedical and health corpora can be analyzed for grammatical and rhetorical conventions. Such studies confirm the high prevalence of the passive voice and hedging devices in biomedical writing. They also reveal highly formulaic patterns of discourse. Making these conventions explicit for authors and readers is likely to relieve much of the burden of writing and interpreting academic papers. The analyses referred to have been incorporated into online learning programs for authors (see www.bmhlinguistics.org) and a concordancer (search engine) which permits authors to search corpora for authentic examples of usage of words and phrases input by the user (www.bmhlinguistics.org/joomla2/more-about-joomla/25-about-bmh/150-introducing-cqpwweb). More recently, the biomedical publisher Springer has emulated this model with its own concordancer, allowing users to search its massive archives of biomedical and health journals (see www.springerexemplar.com).

In summary, the methods of corpus linguistics make explicit and quantifiable the distinctions between written general English and the written language(s) of biomedicine and health—also called biomedical English. This allows learners and educators to focus their efforts on the aspects of language which learners are most likely to encounter. More efficient language acquisition frees time and energy for the other important responsibilities of these professionals, and facilitates the development, dissemination, and implementation of new knowledge which improves the human condition in very concrete ways. Explicit knowledge of written biomedical language also permits meaningful assessment of competency, which preserves the integrity of educational and licensing standards.

Factor Analysis

YASUYO SAWAKI

Factor analysis is a multivariate statistical technique developed in the early 20th century. In factor analysis, relationships between observed variables and latent (unobservable) factors are examined in an attempt to find a parsimonious explanation of the pattern of relationships among variables. There are two types of factor analysis. Exploratory factor analysis (EFA) is a data-driven approach often employed in early stages of an investigation. For example, EFA is useful when the underlying empirical factor structure of a newly developed instrument is explored. In contrast, confirmatory factor analysis (CFA) is a theory-driven approach often employed in later stages of an investigation, such as validation of an existing instrument. CFA is appropriate when there is a strong enough theoretical and empirical basis to hypothesize the underlying factor structure of a given instrument. EFA and CFA can be combined within a single study as well. In such a study, an EFA is typically conducted as a preliminary analysis. Its results are then used to guide a subsequent CFA. This entry focuses primarily on an overview of some key features of EFA. CFA can be viewed as a special case of structural equation modeling (SEM).

Previous Applications of Factor Analysis in Applied Linguistics

Recognized as a powerful statistical analysis tool, factor analysis has been applied to a bulk of applied linguistics studies. Factor analysis is often used, for instance, in second language acquisition (SLA) and language assessment studies that involve development and validation of survey and assessment instruments. For example, Bachman, Davidson, Ryan, and Choi (1995) conducted EFAs separately on the Cambridge First Certificate in English (FCE) and the Test of English as a Foreign Language (TOEFL) to identify the tests' factor structures. Then, Bachman et al. (1995) explored the comparability of the constructs assessed in the FCE and TOEFL subtests by conducting another EFA across the two tests. For another example, Vandergrift, Goh, Mareschal, and Tafaghodtari (2006) combined EFA and CFA within a single study for the development and validation of a new survey on L2 learners' metacognitive awareness and strategy use in listening. First, the authors conducted an EFA of a large sample to finalize the survey content. Then, they validated the factor structure of the resulting survey by conducting a CFA on a different sample. Factor analysis can be used for descriptive purposes as well. For instance, Biber, Conrad, Reppen, Byrd, and Helt (2002) conducted an EFA to summarize various linguistic features of texts in an academic language corpus and identify linguistic characteristics that distinguish different spoken and written registers in academic English.

The Logic Behind Factor Analysis

Factor analysis—both EFA and CFA—is based on the common factor model. In common factor analysis, an observed correlation matrix is usually analyzed. The logic behind the common factor model is that, when a set of variables correlate with one another, they do so because they tap the same construct represented by a latent factor to certain degrees.

DOI: 10.1002/9781405198431.wbeal0407

2 FACTOR ANALYSIS

A primary goal of EFA is to identify an optimal number of latent factors (called a factor solution) that sufficiently explains the pattern of relationships among observed variables. The common factor model decomposes variances of observed variables into two parts: (a) common variance (the variance that is influenced by a latent factor[s] shared across different variables), and (b) unique variance (the remaining variance that cannot be explained by the common latent factor[s]). The unique variance has two subparts: unique score variance that can reliably be explained by factors not included in a factor model and variance due to measurement error. A resulting EFA model is evaluated in the extent to which it reproduces the observed correlation matrix.

Key Steps and Decisions Involved in EFA

EFA is readily accessible to practitioners because it is implemented in major statistical packages such as SAS and SPSS. However, a thorough understanding of the methodology is essential for a successful EFA application because various decisions made in each of the four main steps of EFA below can affect analysis results in important ways.

Step 1: Verifying Appropriateness of Study Design and Data for EFA

Fabriger, Wegener, MacCallum, and Strahan (1999) and Floyd and Widaman (1995) discuss various study design and data requirement issues of consideration in determining whether conducting EFA is appropriate. For example, variables subjected to a common factor analysis should be on interval or quasi-interval scales. Caution should be exercised when variables scored for two categories such as right or wrong (dichotomous variables) are factor analyzed (see Floyd & Widaman, 1995, for further details). Second, at least three to five variables are required to identify a latent factor. Thus, for example, only up to three factors can meaningfully be extracted from a 10-item survey. Sample size is another important issue. An EFA based on too small a sample would yield results that are not generalizable to another sample. Recommendations on appropriate sample sizes for EFA in the literature vary greatly. According to Fabriger et al. (1999), previous research suggested that a sample size of as small as 100 may be acceptable under certain conditions. However, a required sample size depends on various issues such as the strength of correlations between factors and its indicator variables, reliability, and distribution of variables, and the number of factors to be extracted. Finally, normality of data and linearity of relationships among pairs of variables should be examined. If one or more variables are not normally distributed, or if nonlinearity is found, transformation of affected variables may be applied before conducting an EFA (see Tabachnick & Fidell, 2007, for further details).

Step 2: Determining the Number of Factors to Extract

A next step is to analyze data empirically to determine how many factors to extract. Some criteria developed for this purpose are based on eigenvalues for the correlation matrix. For each matrix, eigenvalues are calculated for as many components as the number of observed variables. An eigenvalue indicates how much variance of a set of variables a given component explains. The goal of this analysis is to identify the number of components that have large enough eigenvalues to explain interrelationships among observed variables. Among the most widely used criteria is Kaiser's criterion (Kaiser, 1960), where as many factors as the number of eigenvalues exceeding 1.0 are retained. Another is the scree test (Cattell, 1966), where a line graph of eigenvalues of different components is examined to identify the last substantial drop in the slope. While relatively less common, another approach along this line is parallel analysis (PA) (Horn, 1965), where eigenvalues obtained

from real data are compared against those obtained from multiple samples of random numbers (see Hayton, Allen, & Scarpello, 2004, and Liu & Rijmen, 2008, for more details). Besides the methods based on eigenvalues above, information about the goodness-of-fit of a given factor solution is available when maximum likelihood (ML), discussed below, is used to extract factors. Various authors suggest using multiple criteria in determining how many factors to extract because these criteria do not always produce accurate results. In particular, research has shown that Kaiser's criterion often produces misleading results. Moreover, in the subsequent steps, alternative factor solutions should be examined carefully for substantive interpretability and parsimony in order to identify an optimal factor solution.

Step 3: Extracting and Rotating Factors

Once a rough number of underlying latent factors is identified, a mathematical function is fitted to data in order to extract an intended number of factors. Statistical packages offer various factor extraction methods for analyzing continuous data. For instance, a popular factor analysis method—principal factor analysis—does not assume multivariate normal distribution of variables. In contrast, ML, which is gaining popularity lately, assumes multivariate normality. Despite the strong distributional assumption, a notable advantage of ML is the availability of additional information about the goodness-of-fit of a proposed factor solution. In addition, statistical packages often list principal component analysis (PCA) as a factor extraction method option. Note, however, that PCA is a mathematical data-reduction technique that is not based on the common factor model. PCA is more appropriate, for example, for creating a composite variable that retains a maximum amount of information from a larger number of variables for further analyses.

Model parameter estimates, such as factor loadings and inter-factor correlations, are among the key information obtained from an EFA run. A factor loading is a standardized estimate of the strength of the relationship between a given observed variable and a latent factor, which is analogous to a standardized regression coefficient in multiple regression analysis. An inter-factor correlation can be interpreted like a true correlation between a pair of factors, which is adjusted for measurement error.

When only one factor is extracted, factor loadings from the initial solution can be interpreted directly. However, when multiple factors are extracted, a mathematical transformation called factor rotation is applied to the initial factor solution to improve its interpretability. There are two types of factor rotation methods. One is orthogonal rotation, which does not allow factors to correlate with one another. When there is a possibility that factors are correlated, using an oblique rotation is more reasonable.

Step 4: Interpreting Key EFA Results

The last step is to carefully interpret analysis results. Suppose that an investigator designs a survey on L2 learning strategy comprising eight items, where cognitive strategy use is assessed with Items 1–4, and metacognitive strategy use with Items 5–8. The items are based on a seven-point Likert scale, which can reasonably be treated as a quasi-interval scale. Suppose further that the investigator expects that the two factors are correlated with each other because they represent different aspects of a broader construct (L2 learning strategy). Table 1 presents a pattern matrix, which contains factor loadings after an oblique rotation, for a two-factor solution for this hypothetical survey.

In EFA applications, a factor loading with an absolute value exceeding 0.3 or 0.4 is often considered salient (Brown, 2006). Table 1 shows that Items 1–4 load on Factor 1, and Items 5–8 load on Factor 2. Thus, the two factors can be interpreted as a cognitive strategy factor and a metacognitive strategy factor, respectively. Factor loadings of items and correlations

Table 1 Factor loadings for a hypothetical survey example

	<i>Factor 1</i>	<i>Factor 2</i>	<i>Communality</i>
Item 1	0.66	0.05	0.44
Item 2	0.55	0.09	0.31
Item 3	0.45	0.10	0.21
Item 4	0.80	0.15	0.67
Item 5	0.05	0.60	0.36
Item 6	0.22	0.50	0.31
Item 7	0.10	0.70	0.50
Item 8	0.25	0.75	0.65

among factors are used to calculate communality, or the estimated proportion of the variance of an item explained by latent factors included in a factor model. For example, Item 4's loadings on Factor 1 (λ_{41}) and Factor 2 (λ_{42}) are 0.80 and 0.15, respectively. If the obtained inter-factor correlation (ϕ_{21}) is 0.30, the communality of Item 2 is $\lambda_{41}^2 + \lambda_{42}^2 + 2\lambda_{41}\phi_{21}\lambda_{42} = (0.80)^2 + (0.15)^2 + 2(0.80)(0.30)(0.15) = 0.67$ (Brown, 2006, pp. 90–1). Thus, these two factors explain 67% of the variance of this item, while the remaining 33% is left unexplained.

Guidelines for Conducting EFA

When used appropriately, EFA can provide a strong empirical basis for developing and validating various types of instruments and for summarizing language data. It is unfortunate, however, that EFA has often been criticized in the literature. This is not because of fundamental weaknesses of the technique itself, but primarily because of its frequent misuses in previous applications. For example, in their useful guidelines for conducting EFA, Fabriger et al. (1999), Floyd and Widaman (1995), and Preacher and MacCallum (2003) lament that many previous EFA applications involved a series of suboptimal decisions concerning the number of factors to retain as well as factor extraction and rotation methods. While these criticisms were raised in other fields, applied linguists should keep their points in mind as well. Relatively nontechnical and yet comprehensive introductions to factor analysis such as Brown (2006) and Tabachnick and Fidell (2007) should prove useful for understanding basic principles and procedures of EFA.

Fairclough, Norman

HUHUA OUYANG

Norman Fairclough (1941–) is currently emeritus professor of linguistics at Lancaster University. Fairclough's line of inquiry is generally referred to as textually oriented discourse analysis (TODA), and he is widely acknowledged as one of the main leaders of critical discourse analysis (henceforth CDA). His main efforts have evolved around the objective to reveal the sociological nature of language as constituting and constituted by social relations and social changes through power and ideology.

His major contribution as a linguist lies in introducing critical social theories into language studies, different from or in opposition to the tradition of formal linguistics that concentrates only on the "scientific" mechanism of language. Specifically, Fairclough (1989) has pointed out that mainstream linguistics—the study of grammar—isolates language from its historical and social context; that pragmatics is unrealistic in assuming equal and cooperative relationships between interlocutors; that sociolinguistics, though having *described* unequal power distribution in language use, has not set out to *explain* complex interrelations of language and power.

Much of Fairclough's philosophical sources are from critical theories, such as the works of Pierre Bourdieu, Jürgen Habermas, and particularly Michael Foucault. Foucault's (1972) social theory of discourse had a heavy impact on Fairclough's theoretical framework in developing CDA. Foucault sought to understand the relationship between discourse, knowledge, and power and contended that often taken-for-granted social constructs (e.g., conventions, crime, and justice) are products of power, which is creative and contested in nature and actually constructs the system of knowledge.

While drawing upon critical social theories for his research, Fairclough challenges the contributions of Foucault and other social theorists for being too abstract and theoretical, and not analyzing particular instances of discourse (Fairclough, 1989). Therefore he has applied the critical perspective to detailed analysis of actual texts (verbal, written, or visual). Along with other critical discourse analysts, such as Ruth Wodak, Teun van Dijk, Günther Kress, and Theo van Leeuwen, Fairclough has expanded the scope of both language and social studies and brought an interdisciplinary or transdisciplinary approach to discourse studies.

The central objective in Fairclough's analysis is to raise the critical consciousness of language users, by revealing dialectical relations between language, power, and ideology. According to Fairclough (e.g., 1989), there is a widespread underestimation of the significance of language in the production, maintenance, and change of social relations of power. Power exists in various modalities; it is exercised through *coercion* not only by the use of physical violence but also by coercive language, but it is also and most notably exercised linguistically through the manufacture of *consent*. Ideology is the prime means of such manufacturing of consent. Commonsense assumptions (for instance, taking authority and hierarchy in consultations between doctors and patients as natural), embedded in particular conventions and determined by the underlying power relations, are ideologies. Using language is the most common form of social behavior where people rely habitually on such commonsense assumptions.

In *Discourse and Social Change* (1992), Fairclough outlined a three-dimensional theoretical framework for critical discourse analysis (1989, 1992, 1995b), which makes possible a systematic description, interpretation, and explanation of discourse as social practice. Text, discursive practice, and social practice constitute three dimensions of this discursive analysis framework, corresponding to the analysis at the local, institutional, and societal levels. Text is at the center of the analysis. For analyzing the textual dimension, Michael Halliday's systematic functional linguistics and its three domains of ideational, interpersonal, and textual analysis are adopted (Halliday, 1978). The second dimension of analysis is concerned with the production, distribution, interpretation, reproduction, or transformation of texts. Discursive practices are mediators between microlevel texts (at the first dimension) and macrolevel sociocultural practices (at the third dimension), where orders of discourse and power are realized through interdiscursivity.

Fairclough has pushed his research far beyond the domain of language studies into social studies (for instance, media and organizational studies), by focusing more on the social function of discourse as a constitutive and transformative element in wider processes of contemporary social change, and addressing a wide range of issues including racism, immigration, gender, education, war, terrorism, welfare, unemployment, knowledge economy, information society, and globalization.

Globalization is a central theme of Fairclough's more recent work (e.g., Fairclough, 1995a, 1995b, 2000; Chiapello & Fairclough, 2002), where he has explored the dialectic between the global and national/local, a two-way process of conditioning and shaping. Globalization is seen not merely as an economic process (or ongoing and incomplete tendency) based on neoliberalism and fostering neocapitalism, but also as a more general process affecting politics and culture. The *representation* of these processes and their relations are scrutinized as a crucial force producing a new global order. The struggle to impose or resist the new order hence becomes to a considerable extent a struggle for or against new language.

In his 2006 work *Language and Globalization*, Fairclough has stressed the significance of nondiscoursal elements, such as social agency, arguing that discourse changes cannot be translated into social changes without the strategic action of social agents. There are circumstances and conditions which may restrain discourse-led changes. Local social agents may employ discourse strategies to *recontextualize* new or globalist discourses to maximize their interest in their sociocultural, historical, and political contexts. In contrast with his previous research, which is primarily conducted in developed countries, Fairclough has expanded his research area to the third world, including countries like Thailand, Romania, and Hungary. The expanded geographical feature, together with the balanced focus on both discoursal and nondiscoursal elements in discourse analysis, indicate a new and further development in CDA.

Sharp criticism from the field of linguistics (e.g., Widdowson, 1995; Stubbs, 1997) has been addressed to the work of Norman Fairclough and his CDA colleagues, arguing that the analysis of the CDA school confuses discourse analysis with textual interpretation, and that CDA analysts' own (often ideological) interpretations are privileged over others', which could damage or even destroy the objectivity of their research.

The criticism targeted at CDA seems to be based on a positivist view of "objectivity." Instead of presuming spurious neutrality about social issues, CDA argues that social science researchers should be open with their readers about their positions and aim to raise critical language consciousness among the public by integrating various approaches to discourse analysis (Fairclough, 2000). Fairclough (1989) has made explicit his own political position as a socialist with a generally low opinion of the social relationships in his society (Britain) and a commitment to the emancipation of the people who are oppressed by them. He prefers to use the term "trans-disciplinary research" to describe CDA (2003), accentuating the point that CDA gains its development through a long-term dialogue

between disciplines and theories with each drawing upon the concepts, categories, and logics of the others to pursue its own development rather than being reduced to others. This orientation helps critical discourse analysts to reconcile being both critical (in terms of doing social research with political commitments) and scientific (in terms of obtaining evidence from linguistic analysis).

The substantial changes brought about by globalization in contemporary social life have made power struggles more of an ideological type and, thus, more opaque and hidden. The exercise of power is increasingly achieved through the ideological workings of language. However, as Fairclough has explicated (e.g., 1989, 1992), there is a gap between the level of critical consciousness which the contemporary position of language demands and the level it actually attracts. Resistance to and attempts to change hegemonic and unequal power relations are continuously happening, but the effectiveness of these efforts depends on the development of a critical consciousness of domination and its ways of realization. He has further advocated the inclusion of *critical language awareness* in the school curriculum, from the understanding that the educational system has the major immediate responsibility for producing differentials in access to social resources, and “any system of education is a political way of maintaining or modifying the appropriation of discourse, along with the knowledge and powers which they carry” (Foucault, 1972; see Fairclough, 2000).

As a consequence of the over-reliance on the ahistorical, de-ideological, and socioculturally insensitive frameworks, which come mainly from linguistics, applied linguistics—including TESOL as a discipline—has long suffered from short-sightedness, ethnocentricity, and (subtle and covert) hegemony (Ouyang, 2004, p. 12). The situation has been increasingly attributed to the global symbolic domination of the English language, whereby in less developed areas such as China, TESOL has been exploited as a tool of colonization by the West (Phillipson, 1992; Pennycook, 1994, 1998). For learners, teachers, researchers, and administration staff involved in English-language teaching and learning, it becomes almost a must to have a sense of social responsibility toward appropriating English language as a social discursive mediator in tackling hegemony and inequity. Whether in voting for language policies sensitive to local culture or choosing textbooks or multimedia technologies from publishers of various backgrounds, in fighting against the institutional dominance of “quantitative” research over “qualitative,” or in understanding everyday classroom routines and rituals (such as questioning about truth or turn taking for identity negotiation as socialization processes for conservative or liberal citizenship), Norman Fairclough’s notion of “critical language awareness” certainly can be a powerful weapon to have.

Fairness in Language Assessment

STEPHEN STOYNOFF

Introduction

In the past few decades, the term *test fairness* has been appearing with increasing frequency in the applied linguistics literature. According to the *Dictionary of Language Testing*, test fairness

is concerned with the consequences of testing for individuals, groups or society as a whole. It relates both to the *validity* of a given test as an index of *ability* and to the whole testing process insofar as it reflects or contributes to social equity. (Davies et al., 1999, p. 199)

As the definition implies, the notion of fairness in language assessment is broad and much of the research can be categorized into two strands: investigations of fairness as it pertains to the test itself and fairness as it relates to the social consequences associated with test use.

From a psychometric perspective, test fairness has been viewed as a basic issue of equity and the absence of bias in measurement. Does the assessment unfairly advantage one group of test takers over another for reasons other than what the assessment is intended to measure? The typical response to the question has been to analyze the test performance of different groups of test takers based on salient characteristics (e.g., first language, country of origin, and gender) in order to determine if selected aspects of the test (test items, administration, or scoring procedures) favor one group of test takers over another. By investigating and identifying potential sources of unfairness in tests, test developers are able to address them and thereby improve the quality of the assessment.

Concern for the impact of tests, on individuals, teaching and learning, and society at large, has begun to affect the test development and evaluation process (Kunnan, 2000, 2004, 2008; McNamara & Roever, 2006; Bachman & Palmer, 2010). Messick (1989a) is widely credited with integrating developments in validity theory into an expanded unified conceptualization of validity that considered the value implications of test interpretation and the social consequences of test use (p. 20). His unitary validity concept provided both a rationale for investigating the values and social consequences associated with test interpretation and use and a framework within which to link these considerations explicitly to construct validity (Messick, 1989b). Messick (1989a) argued that the “evaluation of the social consequences of test use as well as of the value implications of test interpretation, all contribute in important ways to the construct validity of score meaning” (p. 19).

Conceptualizations of and Approaches to Fairness in Assessment

Educational measurement specialists have been interested in fairness issues for decades, and their views have shaped the discourse in applied linguistics. For example, the influence of Messick, Kane, Willingham, and Cole, among others, is evident in the views of fairness articulated by Kunnan (2004) and Xi (2010). Willingham describes test fairness as

“comparable validity across all aspects of the assessment process from the initial design to the consequences of use,” and, for Willingham, the principal concern is the need to determine and address sources of “noncomparability” (1999, p. 221). From this perspective, fairness is connected to “equity, validity, and bias” (Willingham, 1999, p. 219). Xi (2010) adopts essentially the same perspective, albeit with additional restrictions: fairness is “comparable validity for *identifiable* and *relevant* groups across all stages of assessment, from assessment conceptualization to the use of assessment results” (p. 154).

Kunnan has devoted considerable attention to fairness in language assessment. In early work, he proposed three fairness concerns (validity, access, and justice) that he believed ought to be addressed in test development and use. Validity was characterized in terms of the need to establish *equal construct validity* for test score interpretations across various test-taker groups and relevant test-taker characteristics by controlling for bias in test content, format, item or test functioning, and use of language or stereotyping. Access concerns represented the various constraints imposed on test takers due to financial, geographical, or personal (e.g., a disability or impairment) circumstances, a lack of prior opportunity to learn test material, or a lack of prior experience with test conditions and equipment. Justice concerns had to do with societal equity based on the consequences of testing and included legal challenges that established remedies or protections for test takers or limits on the use of test scores (Kunnan, 2000, pp. 3–4). From this perspective, fairness is a superordinate concept and validity is embedded in it.

In Kane’s view, validity and fairness are closely related and the extent to which one concept is subsumed by the other concept depends upon how broadly or narrowly each is defined. He prefers to define both notions broadly and does not consider either concept to be fully incorporated into the other. According to Kane (2010), fairness in language assessment can be defined generally in terms of *procedural* fairness and *substantive* fairness. The former has to do with “a lack of bias for or against any individual or group” (2010, p. 178) while the latter “requires that the score interpretation and any test-based decision rule be reasonable and appropriate, and in particular, that they be equally appropriate for all test takers (at least roughly)” (p. 179).

McNamara and Roever (2006) contend that current approaches to test development and use provide insufficient attention to the social role and function of tests. While the authors do not define fairness per se, they refer to “social fairness” and the need to avoid “bias in favor of or against test takers from certain social groups, particularly minorities” (p. 6). They believe that social fairness can be promoted by investigating differences in test-taker performances (particularly differential item functioning) and by adopting ethical and professional behavior based on codes of ethics and fairness guidelines.

Fairness Frameworks

Conceptual frameworks are useful in defining a construct and focusing investigations of it. Based on developments in educational measurement and applied linguistics, Kunnan has elaborated his conceptualization of fairness and proposed two complementary frameworks for addressing fairness concerns, a test fairness framework and a fairness context framework. The former comprises five test qualities (*validity, absence of bias, access, administration, and social consequences*) that are considered key fairness concerns in test development and use (Kunnan, 2004, p. 27). Because tests exist in complex environments, it is difficult to account for all the potential factors that affect them. The fairness context framework seeks to account for the macro-level influences operating in a given situation, and these include “the political and economic, the educational, social, and cultural, and the technological and infrastructure, and the legal and ethical” factors that are in play (Kunnan, 2008, p. 240).

Xi (2010) has proposed a framework for investigating fairness concerns that reflects the current emphasis in educational measurement on an argument-based approach to validation (Kane, 2006; Chapelle, Enright, & Jamieson, 2008; Bachman & Palmer, 2010). Kane (2006) posits two types of validation arguments: the interpretive argument and the validity argument (p. 23). An interpretive argument offers a general rationale for the interpretation of individual test scores and any decision(s) based on the scores, whereas a validity argument offers an evaluation of the interpretive argument based on an analysis of the evidence both for and against the proposed interpretations and uses of test scores (Kane, 2010). In Xi's framework, fairness is viewed as a fundamental aspect of validity. Test developers conduct investigations of "the comparability of scores, score interpretations, score-based decisions and consequences for sub-groups" (Xi, 2010, p. 157) and integrate the results into a fairness argument that then becomes part of the validity argument.

Much of the empirical fairness research conducted to date has sought to identify test items and influences that lead to differential performance on language assessments across different groups of test takers. One important area of research has been investigations of the extent to which test items function differently for different groups of test takers (differential item functioning or DIF studies). DIF analyses allow test developers to detect possible bias in language assessments. Based on a meta-analysis of DIF studies published between 1990 and 2005, Ferne and Rupp (2007) concluded that studies are only beginning to be conducted on language assessments outside of North America and language assessments that include multiple item formats, multiple subgroups of test takers, and the use of multiple DIF methods. The authors called for future studies (a) to include more information on the characteristics of study participants and the assessment, (b) to present an adequate rationale for the choice of subgroups in the analyses, (c) to explain the causes of DIF, and (d) to select an appropriate DIF method based on the characteristics of the assessment.

Other fairness research has examined the effect of test-taker background factors on the test performance of certain groups (Weigle, 1998), the effect of rater behaviors on test scores across groups (Brown, 1995; Lumley & McNamara, 1995), and the invariance of factor structures of test scores for different groups (Bae & Bachman, 1998; Striker & Rock, 2008). For a list of the range of investigations conducted on language assessments, see Kunnan (2000). While empirical studies have represented one approach to fairness concerns in language assessment, the establishment of standards of professional conduct has been another.

Fairness Standards and Guidelines

As noted previously, developments in allied disciplines have influenced how applied linguists address fairness in language assessment. A noteworthy example is the work of a joint committee comprised of representatives of three US professional associations. This authoritative group produced the *Standards for Educational and Psychological Testing* (American Educational Research Association, American Psychological Association, & National Council of Measurement in Education, 1999) and the *Code of Fair Testing Practices in Education* (Joint Committee on Testing Practices, 2004). Fairness receives major treatment in the *Standards* and the four chapters devoted to it address concerns for fairness in testing and test use, the rights and responsibilities of test takers, testing individuals of diverse linguistic backgrounds, and testing individuals with disabilities. The *Code* complements the *Standards* and offers professionals a practical guide to "fulfilling their obligation to provide and use tests that are fair to all test takers regardless of age, gender, disability, race, ethnicity, national origin, religion, sexual orientation, linguistic background, or other personal characteristics" (p. 2).

Davies (2008) has highlighted the importance of standards and ethics in shaping professional conduct. The international language testing community has engaged in extended debate on what principles and practices ought to be endorsed by the profession. These discussions culminated in the development and dissemination of professional codes of ethics and practices by the International Language Testing Association and the Association of Language Testers in Europe. Many test publishers have adopted the standards and practices advocated by authoritative professional groups. Educational Testing Service, for example, has aligned its practices with those in the *Standards* and created fairness review guidelines that provide practical guidance on how to minimize unfairness in the test development process and how to conduct fairness reviews of tests.

Fairness review guidelines can assist test developers in both identifying and mitigating influences on test scores that are not attributable to the test construct. For example, limitations in test takers' knowledge (linguistic, topical, or cultural) that are unrelated to the test construct may result in differential performance by some groups. Test content that evokes strong emotional reactions may distract and therefore compromise test takers' performance. Additionally, when a test is delivered in a way that makes it more difficult for test takers with disabilities, it is likely to contribute to construct-irrelevant variance in scores and undermine the validity of score inferences made on the basis of the test takers' performance.

Accommodations are one way to mitigate the effect of test delivery on test takers' performance, and major testing programs routinely offer accommodations to test takers with disabilities. Depending upon the nature of the disability, an accommodation may include the provision of an interpreter, an alternate format (Braille or larger print), or additional time to complete the test. Some of the most frequently used test accommodations include modifying the (a) presentation format, (b) response format, (c) time allocation, and (d) test setting. Although these accommodations appear in the chapter of the *Standards* (American Educational Research Association, American Psychological Association, & National Council of Measurement in Education, 1999) that addresses the assessment of individuals with disabilities, Elder and Davies (2006) have suggested that accommodations, in particular modifications in how the test is delivered, may also be warranted when users of English as a lingua franca are assessed on their ability to communicate in Standard English. At present, there is a paucity of empirical research on the effect of accommodations on test takers' performance on language assessments, and because accommodations may influence performance and the validity of score inferences, it is important to investigate the effect of various accommodations on the performance of those groups that receive them as well as those that do not.

Fairness and the Consequences of Tests and Testing

It has been well documented that social, political, and educational forces affect test use (Spolsky, 1995; Shohamy, 2001; McNamara & Roever, 2006). Given the power of tests and the potential for them to be used in ways that are unfair and undemocratic, Shohamy has argued that a critical stance (critical language testing) must be taken toward language testing (Shohamy, 2001). Lynch (2001) agrees and submits that critical language assessment takes "gender, sexuality, class, ethnicity, race, ideology, identity, and culture" into consideration in the language assessment process (p. 362). For those who adopt a critical perspective, the validity evidence used to justify the assessment process will include judgments about the ability of the process to improve the circumstances of those in the assessment context and assist them in confronting and eliminating the "oppression, inequality, and injustice" that exists in their lives (Lynch, 2001, p. 368). The advocates of this perspective have raised important questions about the social consequences of test use.

Concerns for the consequences of testing have also led to more investigations of the use and impact of language assessments. Although a number of empirical studies of test consequences have been published (Cheng, Watanabe, & Curtis, 2004; Wall, 2005; Hawkey, 2006), they have not examined whether a language assessment has a differential impact on different test-taker groups. In cases where high-stakes decisions are made on the basis of test results, as for example in the use of tests for immigration and citizenship purposes, it is important to investigate the impact of the assessment on different groups of test takers and to provide evidence that the assessment does not advantage certain groups.

Current immigration policy in the United Kingdom requires those who are seeking citizenship or permanent residency to demonstrate English language proficiency equivalent to level B1 of the *Common European Framework of Reference for Languages* (Blackledge, 2009). Such an explicit language proficiency requirement clearly advantages those who have had more extensive exposure to English over those who have not. Moreover, the use of a language assessment for this purpose not only underscores the extraordinary power of tests in society, but it also illustrates the significant social consequences that can result from test use.

Fairness in Classroom Assessment

Basic fairness concerns, such as the absence of bias in the assessment, the equitable treatment of all test takers during the assessment process, the opportunity to learn what is assessed, and the appropriate use of assessment results, are as relevant to classroom assessment as they are to the development and use of large-scale tests. Camilli (2006) maintains that promoting equity and fairness in classroom assessment is not as much about treating every student the same as about giving every student the optimal opportunity to learn by differentiating among them. In addition to using age-appropriate assessment procedures, fairness in classroom assessment means focusing on student learning and allowing students to demonstrate what they have learned, using an array of assessment procedures suitable for the assessment purpose (Shepard, 2000). Students are better able to display their knowledge and skills when they know the purpose of the assessment, the expected response, the criteria for judging their performance, and when they have multiple opportunities to demonstrate on multiple measures what they know and can do (Camilli, 2006; Shepard, 2000). Recent educational reforms have expanded the curriculum in many school systems. In addition to demonstrating that they have met content knowledge standards, students often must demonstrate that they are able to solve real-world problems, engage in critical thinking, and employ metacognitive strategies. For classroom assessment to be fair, the assessment procedures need to be aligned with the curriculum standards, and the procedures need to be appropriate for making judgments about students' achievement in a classroom context.

Conclusion

Fairness constitutes a major focus and a fundamental consideration in language assessment, although assessment specialists continue to debate conceptualizations of fairness and approaches to it. Future progress on fairness concerns will benefit from frameworks that adequately represent the construct as well as empirical research that examines all aspects of fairness. Test developers, policy makers, test users, and test takers are served by developments in language assessment that promote fair tests and fair testing practices.

Family Discourse

CYNTHIA GORDON

Introduction

“Family discourse” refers to a diverse area of study that draws on theories and methods of discourse analysis to examine everyday family communication. Scholars in this area analyze the form conversation takes as well as its functions, which means that they consider not only what is said when family members talk to one another, but also how it is said, by and to whom, at what moment, for what purposes, and with what outcomes. “Family discourse” also refers to the area’s object of study, typically (but not exclusively) naturally occurring interactions between nuclear family members which are audio- or video-recorded, transcribed, and systematically analyzed. Family discourse research investigates how members of families use language to jointly accomplish everyday family life. In other words, this field of research illuminates how family members together create discourse, as well as how discourse creates families. Among the areas studied are family storytelling, play, arguments, apologies, requests, and so on.

Studies in and of family discourse aim to provide detailed, textured, contextualized understandings of family conversations. They demonstrate how fundamental social, cultural, and linguistic processes—including development of communicative competence, relationship negotiation, and identity creation—actually occur. Further, studying family discourse lends insight not only into the nuances of family communication, but also human interaction more generally. Indeed, family discourse research has contributed to development and extensions of key theoretical notions in the field of discourse analysis, including those relating to how speakers convey relational information and identities through talk (e.g., politeness, positioning); how people construct meaning in social situations (e.g., framing); how people draw on previous communicative experiences in interaction (e.g., repetition and intertextuality); how individuals tell stories and why (e.g., various types of narrative analysis); and how people accomplish meaningful action (e.g., speech acts). It increasingly makes cross-cultural comparisons, addresses family diversity, and investigates intersections between family communication and other institutions (e.g., workplaces and the media).

In what follows, general approaches and methods of family discourse research are first outlined. Then, an overview is provided of key findings pertaining to important social processes achieved through family discourse: pragmatic socialization, belief and value socialization, relationship negotiation, and identity construction. Finally, larger implications of family discourse scholarship—for both the discipline of discourse analysis and the study of family communication—are identified and discussed.

Approach and Methods: Discourse Analysis and Data Collection and Transcription

Discourse analysis, a collection of interconnected approaches to the study of language in social context, provides the primary theoretical and methodological frameworks for family discourse research. These approaches—prominent among them conversation analysis,

2 FAMILY DISCOURSE

interactional sociolinguistics, the ethnography of communication, and pragmatics—are generally (but not exclusively) qualitative, and draw on diverse fields, including linguistics, sociology, and anthropology. The bulk of family discourse studies—in efforts to understand how family members actually use language in day-to-day life, how family conversations are structured, and the role of talk in accomplishing the “work” of family—center on the analysis of naturally occurring, everyday family interactions.

Many studies of family discourse have examined the talk of heterosexual, two-parent, white, nuclear families, of roughly middle socioeconomic class, with one or more children. However, it is commonly acknowledged that a diversity of families exists; this diversity is seen as increasingly worthy of scholarly attention, ranging from diversity of culture to sexual orientation of parents. For example, Blum-Kulka (1997) compares and contrasts family discourse across three cultural groups, Jewish Americans, American Israelis, and Israelis; Pash (2008) examines the discourse of families with gay co-parents.

There is a notable emphasis on one context of family discourse: family dinner, which is both meaningful to families and convenient to study. One or more dinners is video- or audio-recorded. In some cases the researcher is a family member (e.g., Watts, 1991); in others, a researcher is present as either guest or as videographer. Recent collaborative studies investigate family talk across various contexts, however, including and beyond dinnertime. For example, a study by Tannen, Kendall, and colleagues conducted at Georgetown University involved continuous daily self-recording by adult family members over one week (e.g., Tannen, Kendall, & Gordon, 2007). A larger, multidisciplinary study by Ochs and colleagues at the University of California, Los Angeles involves family members being video-recorded and observed across multiple days and contexts. Findings of these two projects were published together in a special issue of the journal *Text & Talk* edited by Tannen and Goodwin (2006). The study by Ochs and colleagues, in addition to looking across situational contexts in which family members interact, takes a cross-cultural perspective, as data were collected in the United States, Italy, and Sweden.

Additional studies have considered family interaction in institutional contexts such as family therapy (e.g., Aronsson & Cederborg, 1994) and parent–teacher–pupil conferences (e.g., Adelswärd & Nilholm, 2000). How people talk about family interactions and relationships has also been investigated through analyzing data collected in interviews with one or more family members (e.g., Tannen, 2008).

In order to conduct discourse analysis of family conversations, these must be recorded and transcribed. Specific transcription conventions used, while manifesting some variation, share an orientation toward capturing details. Most transcriptions capture all words uttered; information about pitch, intonation, and tone of voice; and features of conversation like simultaneous talk and hesitations. Aspects of nonverbal communication are also transcribed, sometimes in extremely detailed ways, when video recordings are used. Detailed transcription of talk facilitates analyses of the micro-conversational features that constitute family interaction.

Some family discourse studies accompany recording with ethnographic interviewing (e.g., Blum-Kulka, 1997), direct observation by a researcher (e.g., Tannen et al., 2007), and post-recording interpretation checking with participants (e.g., Tannen et al., 2007). These methodological steps contextualize recorded data and serve as a means of validating analyses.

In sum, capturing interaction through recording and transcribing makes possible discourse analysis of family talk.

Family Discourse and Social Processes

Family discourse scholarship has yielded important insights into social processes that constitute families, including pragmatic socialization of children, creation of family beliefs and values, relationship negotiation, and identity construction. (Note that while discussed in discrete sections, these areas necessarily intersect; for instance, while parents socialize children, they also negotiate their relationship with them and teach them what identities are valued and how these are displayed.)

Pragmatic Socialization

Pragmatic socialization, according to Blum-Kulka (1997, p. 3), refers to “the ways in which children are socialized to use language in context in socially and culturally appropriate ways.” Family interaction provides a key context in which children learn how to do things like “choose and introduce topics for talk, respond appropriately, tell a story, or develop an argument” (Blum-Kulka, 1997, p. 3). Research has considered how parents direct children’s behavior, as well as how children are taught to narrate, take conversational turns, and so on. Studies reveal how socialization is shaped by notions of “linguistic politeness,” which refers to “the culturally complex rules for what is said and how it is said relative to goals, interactants, context and culture” (Blum-Kulka, 1997, p. 13). Research into pragmatic socialization thereby highlights how children are socialized into language use, as well as the role of cultural ideologies and norms in this process.

For example, Blum-Kulka (1997) compares the mealtime discourse of three groups (Jewish American, American Israeli, and Israeli families). She explores shared organizational principles of “dinner talk,” uncovering for instance that mealtime interactions across the groups are structured by the dual goals of socializing children into appropriate uses of language and being sociable with them. However, she also identifies cultural variation. One area of difference is in narrative socialization and participation. She noted, for example, that a particular ritual—“telling your day”—was recurrent in the American families, but was not in the Israeli families (see also Ochs & Taylor, 1995). Whereas in American families, singly told stories are celebrated, in Israeli families, tellings tended to be characterized by active participation of multiple parties who jointly “own” the tales. Further, adults in Israeli families had higher levels of participation as storytellers than in American families, where children took up larger proportions of narrative space. So whereas in all the families children were taught how to participate in narrative talk, this occurred in different ways. One major difference was that American families used dinner table talk as “an opportunity to focus on the children as narrators” (Blum-Kulka, 1997, p. 106), which echoes a child-centered family ideology suggested to be characteristic of middle-class mainstream American culture (by Blum-Kulka, 1997, p. 265; see also Varenne, 1992).

How parents perform control acts is another important area of inquiry in parent-child socialization. For instance, Tulviste, De Geer, and colleagues identify cross-cultural similarities and differences. Tulviste, Mizera, De Geer, and Tryggvason (2002) compare what they call “regulatory comments” in Estonian, Swedish, and Finnish families with an adolescent child. While the authors did not find cultural differences in regulatory comments regarding table manners and rules of conversation, they found that the Swedish family discourse was more symmetrical than in the other two groups: Swedish adolescents commented more on other family members’ behaviors than did Finnish and Estonian adolescents. This finding is consonant with research by Ochs and Taylor (1995) who found in the discourse of American families they analyzed that parents often commented on, or “problematized,” children’s behavior, but the reverse rarely occurred.

In summary, studies of pragmatic socialization in family discourse uncover how socialization practices pertaining to language practice differ (and do not differ) across groups, and how behaviors that children are socialized into relate to broader cultural expectations about language use. They also demonstrate how socialization occurs on a moment-by-moment basis in family conversations.

Socialization of Family Beliefs and Values

Family interaction is a site not only for language socialization, but also for the socialization of attitudes and beliefs. Thus family discourse scholars have considered how children are socialized to think and feel in culturally and family-appropriate ways.

Studies taking a cross-cultural perspective have identified similarities and differences in the values socialized and how socialization occurs. For example, Ochs, Pontecorvo, and Fasulo (1996) examine how children are socialized into food preferences and attitudes in white American and Italian families. They found that while across both groups food is depicted as nutrition, a reward, pleasure, and a material good, in American families low priority was given to food as pleasure, while Italians saw food primarily as pleasure. In addition, whereas American families made distinctions between children's food and adults' food, Italian families emphasized the development of individual food preferences.

Studies have also outlined a range of linguistic strategies that play a role in value socialization. For instance, Gordon's (2007) analysis of political socialization demonstrates how through repetition, referring terms, and storytelling, parents and their son (age 4 years 10 months) jointly socialize one another into a shared political identity. Analyzing the discourse of the same family but in a different context, Tovares (2007) shows how repetition of and response to material on television can be used to identify and negotiate shared values. For example, the mother, watching a television cartoon with the child, draws on the text of the cartoon to support her own view regarding personal hygiene (that one person should not borrow another's toothbrush).

On a broader level, M. H. Goodwin (2006) and C. Goodwin (2007) examine how shared attention is established in family interaction; such attention is a fundamental precursor to accomplishing both pragmatic and value socialization. These studies also demonstrate the role of both linguistic and nonverbal behavior in collaborative socialization processes.

Relationship Negotiation

Families can be considered constellations of relationships that are continually negotiated in talk. How parents and children, husbands and wives, and, to a lesser extent, siblings, (re)create relationships in discourse has been examined by a range of scholars. A primary focus has been on the relational dimension of power or hierarchy. For example, Varenne (1992, see especially chap. 4) focuses on the struggle for power between parents discussing household affairs, and Watts (1991) centers his analysis of one family's discourse on how power is claimed, distributed, and contested.

Narrative has been identified as a primary site for exerting power. For instance, Erickson (1990) finds that family hierarchy plays itself out (and is reinforced) in how a conversation develops in one Italian American family: a gendered topic of discussion (bike accidents) enables the father and sons to reassert their place in the family hierarchy, whereas a contribution by a daughter is ignored. Similarly, Ochs and colleagues (e.g., Ochs & Taylor, 1995) identify a narrative pattern in middle-class American families that serves to (re)assert the father's role as head of the family. In this pattern, which they refer to as "father knows best," the mother invites the child to tell a narrative, the child does so, and the father passes judgment on the child's behavior. Further, the authors found that fathers also judged the mothers' behavior. For instance, a mother tells a story about a workplace experience;

the father then evaluates her behavior as incompetent. While mothers do critique the behaviors of fathers, they were found to do so far less frequently. Ochs and Taylor (1995, p. 117) suggest that cooperation of family members in the creation of the "father knows best" pattern gives fathers a "platform for monitoring and judging wives and children," thereby reinforcing a family hierarchy based not only on generation (parents over children) but also on gender (fathers over mothers).

Relationships are not only characterized by power, however; as Tannen (2001) points out, relationships are continually and simultaneously negotiated in terms of power and solidarity, closeness and distance. Thus she suggests that "father knows best" could additionally be analyzed as the mother attempting to create connection between father and child. Tannen (2008) investigates multiple dimensions (closeness and distance, similarity and difference) in sisters' relationships as these are portrayed in narrative discourse. Kendall (2006) examines how alignments shift moment by moment in communication occurring when one parent arrives home from work and encounters the other parent waiting with the child. She demonstrates how parents can manipulate alignments to (re)establish family harmony. Gordon (2009) highlights the role of repetition and intertextuality in negotiating alignments of solidarity, criticism, teasing, and play in family discourse.

Relationship negotiation has additionally been examined in institutional encounters (medical, educational, etc.) involving family participation. For example, Aronsson and Cederborg (1994) investigate conarration in family therapy and identify various ways family members and the therapist manipulate voice to construct both supportive alignments and opposition. The father, for instance, parodies the son as a way of discrediting him, which leads the daughter to supportively align with her sibling.

In summary, multiple dimensions of family relationships have been considered, primarily but not exclusively in private family conversations. Scholars have identified how specific linguistic devices are used to accomplish relationship negotiation, while also highlighting the shifting nature of alignments in family talk.

Identity Construction

While negotiating relationships, family members simultaneously create family role identities in interaction. Identity construction in families has been investigated on the level of the individual and of the family group. Studies in this area have increasingly emphasized the constructed, fluid nature of identity, and the complex discursive practices involved.

Kendall (2007), for example, shows how gendered identities pertaining to the work-family interface are created in the discourse of two families with one young child. Although parents in these families espoused ideologies of equality in parenting, and mothers and fathers both worked outside the home, in practice the ways they spoke positioned the mother as primary caregiver for the child, and the father as breadwinner. Adelswärd and Nilholm (2000) demonstrate how a mother creates her own maternal identity in a parent-teacher-pupil conference while also helping her child, who has Down syndrome, create a positive self-identity. For example, the mother elaborates and interprets her daughter's turns, which serves both to aid her child's engagement in the conversation and to construct for herself the identity of supportive, good mother.

Scholars have also focused on how shared family identities (as opposed to individuals' identities) are constructed in discourse. For instance, Blum-Kulka (1997) and Tulviste et al. (2002) and others have considered how, through language, family members create and reinforce a larger cultural identity (e.g., Israeli, American, Estonian). While families are shaped by their larger cultural context, each family is also distinctive; each family can be considered as "a small community of speech, an organic unit that shapes and maintains itself linguistically" (Tannen, 2001, p. xvii). Gordon's (2009) analysis of the discourse of

two families, each consisting of two parents and one young child, supports this notion. For instance, members of one family often spoke using marked voices and accents, which helped to create a shared identity as theatrical performers, and as people who appreciate playfulness in everyday life.

Discussion: Implications of Family Discourse Research

Family discourse scholarship reveals how family members use language to accomplish the social tasks of everyday family life, most notably teaching children about how to use language and about family beliefs, negotiating relationships, and constructing identities. It thus has implications for the broader study of family communication and for discourse analysis.

The study of family discourse is the study of communication in family settings. Much scholarship on family communication (in fields such as psychology and communication studies) emphasizes self-report data, quantitative analysis, or analysis of content as separate from linguistic form. The qualitative orientation of discourse analysis, and its consideration of naturally occurring talk of family members as it unfolds moment by moment, adds not only methodological variety but also contextually sensitive perspectives to the field of family communication, including how family discourse intersects with culture and other institutions. The study of family discourse is also, in essence, the study of discourse. And, family discourse research has made substantial contributions to discourse analysts' understanding of how language functions in everyday social activities and processes. It has added important insights into cultural and gendered elements of talk, narration as social practice, theories of meaning making and identity creation, and our understanding of various relational dimensions and linguistic strategies. It thus contributes substantially to the field of applied linguistics.

Family Literacy

VIVIAN L. GADSDEN

Family literacy encompasses a broad array of literacy practices and relationships between children and parents and within families. It may be interpreted as a single concept, in which the focus on literacy is complemented by attention to families, or it may be examined as a multidimensional concept in which families and literacy are studied in tandem to inform and deepen our understanding of the intersections between the two areas of inquiry. To provide an overview of the field, this entry examines these interpretations of family literacy within past, current, and emerging theory, research, practice, and policy.

The Context

Most research in family literacy has been aligned with one of two broad conceptual frameworks that examine, among other questions, the following: what counts as family literacy, which families are studied under the heading of family literacy, what programs are designed and with what purposes and content, and for whom are programs designed? One framework examines cultural and social practices of families. It demonstrates the ways in which these practices inform the nature and course of support to families and build on family members' knowledge and experiences. Much of this work draws upon anthropological and linguistic traditions that use several empirical methods: ethnographic-focused approaches, narratives, discourse analyses, and naturalistic observations. The studies that have resulted are among the most significant in extending the field's focus on literacy as more than reading and writing and shaping our understanding of the range of literacies that constitute families' knowledge, that are available within families, and that families use to navigate their worlds. Developed around a co-constructivist approach to literacy, the research has not been readily translated into family-literacy instructional programs or curricula, nor does it fit neatly into paradigms associated with the field or heavily reliant upon formal assessment measures.

A second broad framework focuses on enhancing children's school achievement. Much of the research and practice derived from this framework is found in studies of parent-child reading and parent-child participation in school-based or out-of-school literacy programs. Because of the specific purpose of improving children's school achievement, this framework typically uses experimental methods and assessment measures similar to those used in K-12 settings to determine change in students' performance. Although families' cultural and social practices are often discussed, these practices tend to take on a relatively insignificant role, compared to the emphasis on children and parents developing reading skills. Challenges attributed to this framework include: the singular focus on poor families as living in literacy-poor contexts; an emphasis on the cognitive dimensions of literacy as opposed to its social dimensions; failure to consider the ethnic and economic diversity of families and family practices; and an assumption that literacy—in the absence of changes to structural and social barriers—will help move poor families from poverty to well-being.

Family literacy is both considered a separate area of research and practice and attached to related areas of study, for example early literacy and early childhood development (e.g., Head Start), K-8 literacy (e.g., Even Start), adolescent and adult literacy, two-generation and

intergenerational learning, and English-language learning. It examines a range of perspectives regarding the composition of families, the reciprocity of literacy learning within households and between home and school, and the relationship between language and linguistic practices. A significant subset of the work investigates the ways in which language and literacy are experienced and adapted in limited English-speaking families (e.g., English-speaking child and non-English-speaking mother) where children serve as language brokers for parents and grandparents (see Weinstein-Shr, 1995; Campano, 2007). Such brokering may occur in English-speaking families with low formal literacy as well (Purcell-Gates, 2004) and repositions the expected role of parent as knower and child as learner to child as knower and parent as learner.

National attention to demographic shifts in the USA, enhanced understanding of the possibilities for teaching and learning, and increasing attention to family literacy across national borders has expanded the field. Compared to the early years of family literacy, we know considerably more, yet not enough, about the types of families who are served (i.e., by social class, ethnicity, and race), the nature of family-literacy experiences, the increases in the numbers and range of programs located within and outside formal school settings, and the relative success of family-literacy efforts for children and adults. This progress demonstrates incremental and strategic efforts in the field and is reflected in an upsurge in the number of empirical research studies, teacher-led projects that aim to address the literacy needs of families, and international studies.

Family Literacy: Issues Past and Present

Although the history of family literacy may direct us to different points of origin, our current conceptualizations of family literacy are arguably linked to the 1960s, when US federal laws on educational access and equal opportunity were being challenged as discriminatory. In response, reading researchers were asked to explain the poor school achievement of minority children from low-income homes. Some studies (e.g., Durkin, 1966) had already been completed, and a wave of others emerged to examine the influence of both families and verbal language—that is, nonstandard dialects such as Black or African American Vernacular English (AAVE)—as essential precursors to children’s reading or as an explanation for the children’s poor reading. The studies focused primarily on reading rather than either writing or broader ideas of literacy. In some discussions, reading problems were attributed to “deficits” in the linguistic and literacy experiences of children resulting from their “disadvantaged” families and low-income communities; in others, they were attributed to “linguistic difference” in which AAVE was determined to be a legitimate, systematic, and rule-governed variety of English. Noted linguists such as Labov (1972) argued that judgments regarding whether language is standard or nonstandard were not linguistic but could be ascribed instead to the vagaries of access and equality in society. Goodman and Buck (1973) suggested that teachers held attitudes about the dialect that were problematic and that may account for some of the differences between the reading success of African American children and that of White children. The implicit message of this work on linguistic difference was that AAVE should no more interfere with reading than other spoken dialects. The subtle indictments of families are noted in a recent work by Baugh and Smitherman (2007), who suggest that African American students in schools were routinely receiving learning and speech pathology placements which at a minimum resulted in a misplacement of effort, taking attention away from the failures of instruction and pointing to the failures of the family, dialect, and child.

The responses to the arguments around deficit and difference were polarizing and continue to be complicated. However, family-literacy research in the 1980s built upon this

work; examined social and cultural practices; and focused on the sociolinguistic, cultural, or contextual factors that influence literacy learning (see earlier discussion of the two dominant frameworks). Drawing upon but extending beyond metacognitive and socio-cognitive approaches, the work highlighted the sociocultural dimensions of literacy learning and urged a more critical analysis of how language and literacy learning are experienced within and across diverse cultural, social, and community settings. Four major publications, drawing upon sociocultural/sociocontextual theories, significantly informed our understanding of language and literacy processes and practices in families and the reciprocity of learning within them: Denny Taylor's (1983), *Family Literacy: Young Children Learning to Read and Write*, which examines six middle-class White families and their children, all of whom were successfully learning to read; Shirley Brice Heath's (1983) *Ways with Words*, which examines the continuity of literacy practices in home and school and the bidirectionality of learning between them in a Black working-class, a White working-class, and a White middle-class community in the Piedmont Carolinas; Teale and Sulzby's (1986) study on emergent literacy, which began to revise some of the deficit perspective and to argue for a more in-depth analysis of the relationship between home interactions and children's academic achievement; and Taylor and Dorsey-Gaines's (1988) study of literacy contexts of poor, inner-city African American families, determining that these homes were steeped in rich practices and traditions with oral and written texts. Other critical discussions during the same period complemented these studies in examining the discourses of Black and Latino children in and out of school and their families.

At the same time as these works appeared, policy efforts were being directed to building programs and practice that would give parents the necessary knowledge, awareness, beliefs, and attitudes to support their children. Family-literacy programs were seen as one option in stemming the tide of low literacy and became driven by policy makers' interpretations of the need. Considerable attention was placed on practice, with comparatively limited support for research. Several programs emerged and have been sustained, with varied foci on skills and cultural practices, for instance the Kenan Model developed by the National Center for Family Literacy, the Missouri Parents as Teachers program, and Home Instruction Program for Preschool Youngsters (HIPPY), to name a few. From the work conducted by Parecki, Paris, and Seidenberg (1997), we know that, while some program models use approaches that reflect a combination of recent instructional innovations in the field of reading, others provide little or no instructional or assessment framework. Programs tend to "pick and choose" from existing models to develop a curriculum that responds to the specific needs of the families they serve. Parecki and her colleagues (1997) noticed immediately when examining family-literacy models that there were few instructional or assessment ideas and tools, yet practitioners in their study identified these needs as the most critical voids in their work. A subsequent study by Parecki (2009) describes an interactive reading program that she created and reinforces the importance of developing the field, noting that there is no ready-made approach that fits all programs.

Auerbach's (1989, 1995) three models—intervention/prevention, multiple literacies, and social change—still hold currency in describing the conceptual, pedagogical, and programmatic possibilities for family literacy. The intervention/prevention approach is consistent with historical efforts to eradicate low literacy among poor, undereducated parents, through a series of programs and approaches designed to replace home practices with school-like approaches. The approach speaks to the power of school literacies and the poverty of home and community literacies. The multiple-literacies approach takes up this sociocultural perspective in a particular way by examining the much-discussed mismatch between the expectations and practices of school-based literacy learning and the home practices of children who are not achieving in school. It argues for "investigating and validating students' multiple literacies and cultural resources in order to inform schooling" (Auerbach,

1997, p. 157), using a range of approaches—from utilizing community resources and cultural artifacts in the classroom to engaging parents as co-constructors of the research and inquiry process, to learning about family histories and experiences as a precursor to teaching, to immersing teachers in the home contexts of parents. A third approach, social change, is focused on multiple literacies and the role of power hierarchies in sustaining political and social structures that alienate rather than engage learners and their cultural histories. Auerbach's categories do not address all the different issues. Some studies that appear to fit under one model may well have components that fall under one or both of the others, for example, multiple literacies and social change.

At present, several long-standing and emerging issues are revising and expanding the field of family literacy. First, since the 1990s, family literacy's focus on parent-child interactions, home practices, and intergenerational literacy has led to increased empirical research on children and families—varying in type, nature, and intensity—participating in programs and the degree to which programs build upon research. However, as a field, family literacy's identity within discourses in the larger field of language and literacy is still fragile. Particularly interesting and controversial have been the increased governmental demands for rigorous randomized studies that stress learning outcomes without also addressing the pathways to those outcomes. In decrying the absence of well-designed experimental research, several discussions have identified a need for higher-level assessment of children's early learning in family-literacy programs. Emphasis on evidence-based approaches from 2000 to the present reinforces this position. While such perspectives are valid, they do not capture completely or accurately the complex problems facing programs and their efforts to address these problems; nor do they reflect the range of studies that have provided us with necessary portraits of family-literacy learners so that we understand the scope of the problem.

Second, the field is beginning to consider the diversity of families and family forms. Questions related to the composition of families; the nature of relationships in families; the presence of two parents (or absence of one parent), grandparents, and extended family; the home languages used; and the significance of race and class raise the need to examine the intersection between family and culture and the ways in which culture is embedded in the practices of individual family members who are learning literacy in programs. Most of these studies use cultural frames of reference to examine family literacy and acknowledge their importance in accessing and engaging families, as well as determining what learners know, what they want to know, and what they are willing to invest. In the 1990s, Purcell-Gates (1995) and Gadsden (1998), among others, proposed a framing of family literacy in which the family is at the center of resulting pedagogical models. More recently, researchers in the USA and other parts of the world have examined the complexity of family-literacy practices within low-income families, focusing on issues of power and identity, as parents with sometimes limited formal literacies aim to negotiate the school experiences of their children, and on the discursive practices and traditions in the family (see Rogers, 2003; Johnson, 2009).

In addition, the field is only beginning to explore the possibilities around multiple issues—new and old. One of these areas focuses on the potential around technologies in working with and studying different types of families and family configurations. Although still limited, discussions of multimodalities and digital literacies have appropriately migrated from K-12 literacy to family-literacy research and practice. Another area points to the increasing attention to English-language learners, as the intersections of language and literacy continue to be a fertile area of inquiry. Past research on immigrant parents yielded data to suggest that the parents were both highly concerned about and supportive of their children's performance in school but also concerned about the cultural loss that their children experience in the USA (see Duran, Duran, Perry-Romero, & Sanchez, 2001;

Suárez-Orozco & Suárez-Orozco, 2001). Other work on young children and families (see Dudley-Marling, 2009; Fantuzzo, Gadsden, & McDermott, 2011) points to the possibilities for building home-school connections in replacing deficit.

Future Directions: A Few Thoughts

Family literacy draws on multiple traditions and areas of study, but is not firmly situated in any. This fledgling identity creates insecurity and opportunity. For many researchers and practitioners, as is true in K-12 schooling, issues-related outcomes and assessment will represent a nagging subject; for others, the instructional focus of programs will be the greatest concern; and for others still, the primary question will focus on cultural difference, race, and poverty and how they are examined and addressed in research and practice.

Several other issues are receiving attention:

- *Culture and teaching.* At all levels of teaching, the questions of what culture is and how to speak to students' culture represent both pressing and uncomfortable issues. Research since 2004 in literacy (see Gonzalez, Moll, & Amanti, 2005) and in family literacy (see Mui & Anderson, 2008) has informed a more expansive notion of culture and social networks.
- *Learning environments that attend to different forms of participation and linguistic and literacy repertoires, as well as new technologies.* Gutiérrez, Zitlali Morales, and Martinez (2009) and Lee (2005), among others, have discussed the importance of environments that are open to the range of knowledge that students bring and the need for these environments to be situated to invite this knowledge as areas upon which to build. Such learning environments make greater use of technology and digital modalities in building on the knowledge of families and to teach and study families (see Kress & van Leeuwen, 2001).
- *Immigrant and language-minority families.* The recent US governmental responses to immigrants and public attention to the issue of second languages make the present and immediate future an important time to examine these critical issues. Such discussions draw upon interdisciplinary knowledge to identify the border crossings of these families.
- *Increased attention to families, not limited to parents, with special attention to issues related to women and fathers.* The emergence of women's issues in adult and family literacy has provoked questions about gender more broadly. A similarly growing body of work examines the issues of men, mostly as fathers. As might be expected, much of our attention has been directed to parents, most significantly mothers, who have been identified over time as influencing children's school achievement more than any other human resource prior to and during school. Fathers are increasingly an area of study, and other family members contribute in meaningful ways to the discourses of literacy in family settings (see Gadsden, 2003).

The changes in family literacy represent the increasing cross-fertilization of ideas and theoretical and practice-focused perspectives on family practices and family learning. The question that persists is whether family literacy, with a focus on families, will draw upon and build broader conceptualizations that consider the culture of the family itself, the ways in which different definitions of family define families and family life, the nature of social relationships, and the changing faces of families in the USA that affect when, how, and under what conditions children and families engage and share literacies.

Feminist Research

JUDITH BAXTER

Background

Feminist research emerged across the social sciences to “give voice” to women’s activities, lived experiences, and perspectives, a mission which had been conspicuously missing in mainstream research. Originating within the context of the women’s movement of the 1960s and 1970s, “modernist” feminist research was principally concerned to document women’s lives and voices, to illuminate gender-based stereotypes and biases, to unearth subjugated, “feminine” knowledge, and to challenge the basic structures and ideologies that oppressed women. The primary purpose of feminist research was therefore emancipatory: to promote social change and social justice for women round the world. Within the field of gender and language, feminist scholars sought to show the dual power of language—as a repressive, patriarchal tool for constructing women’s social, economic, political, and academic subordination, but also potentially as a creative force for female self-expression, empowerment, and consequently cultural transformation.

However, in recent years, postmodernist scholars have challenged this version of feminism—and therefore “feminist research” as a unified project—on a number of grounds. First, they argue that the term “women” cannot be simplistically distinguished from “men” as a biological or social category: In numerous individual cases the boundaries are blurred (see Bergvall, Bing, & Freed, 1996, for discussion). Second, women cannot be reduced to a single group with a uniform experience, ethnicity, class, culture, sexuality, or gendered existence. For example, the experience of a white, middle-class professional woman with a well-paid job might be considerably different to that of an Indonesian woman who leaves her family to work as a “mother’s help” for affluent employers in the West, and sends her wages home (Letherby, 2003). Third, some men (for example, gay or transgendered individuals) are also subject to restrictive gendered practices and identities. Finally, there is no single, agreed approach to feminist research. Scholars hold different perspectives, ask different questions, draw from diverse methodologies and methods, and apply multiple lenses in order to make their analyses of feminist issues. Some feminist researchers use traditional methodologies largely involving quantitative methods but ask new questions, while others work primarily with qualitative methods to challenge, contest, and upset these approaches, or create new, multidisciplinary methodologies of their own.

Historically within the applied linguistics field of gender and language, there has always been a diversity of approaches to feminist research even before recent theoretical complexities. Early research relied on the anthropological principle of introspection or “native speaker intuition.” The widely acknowledged pioneer in the field, Robin Lakoff (1975) made anecdotal observations about the ways in which American women were socialized to use language in a “ladylike” way, which made them sound more tentative, hesitant, and less confident than men. Similarly, Dale Spender (1980) also based her thesis of “man-made language” (such as the “false” generic singular pronoun “he” in academic writing to denote women as well as men) on anecdotal, observational data.

Subsequent gender and language research was far more empirically based and drew principally on recorded observations of small-scale social interactions, interview data, and

subsequent discourse analysis. There were three theoretical strands to such research. *Dominance theory* studied “mixed-sex” interactions to consider the ways in which men used conversation as a mechanism of social power to dominate women through linguistic features such as interruptions, verbosity, silences, and back-channeling (e.g., Zimmerman and West, 1975). *Difference theory* similarly studied short stretches of conversation, but usually in single-sex contexts, to show that women’s talk was an outcome of different linguistic subcultures, and should be reevaluated from a feminist perspective as “different but equal” (e.g., Tannen, 1993; Coates, 1996). More recently, *social constructionist theory*, currently the dominant research paradigm and postmodernist in spirit, explores language as a means of gendered construction (e.g., Crawford, 1995). Like dominance and difference theories, this approach analyzes linguistic interactions in transcripts, but with the purpose of showing how speakers construct or resist their varied identities as male, female, inter-sexed, transgendered, and so on. Social constructionist theory also studies the ways in which gender stereotypes such as the “trophy wife” or the “ball-breaker female leader” are constructed, reinforced, and contested in a range of texts in public domains such as the mass media.

Feminist Epistemologies

Arguably, three key epistemological principles continue to guide both modernist and postmodernist feminist research as follows.

Political Motivation

While scholars no longer perceive feminist research as a unified project, even quite radical feminist poststructuralists such as Ramazanoglu (2002) consider that the “only” ground on which something distinctively feminist can be claimed for the use of diverse methodologies is:

some shared political and ethical commitment that makes [researchers] accountable to a community of women with moral and political interests in common . . . Feminist research is politically *for* women; feminist knowledge has some grounding in women’s *experiences*, and in how it *feels* to live in unjust gendered relationships. (Ramazanoglu, 2002, p. 16)

For *modernist* feminist research, this “political and ethical commitment” was an essentialist quest to locate the causes of women’s oppression in the structures and practices of language and/or society, in order to instigate material changes in women’s lives. As Williams (1996, p. 66) notes, women’s oppression was variously thought to be the result of “capitalism, patriarchy, capitalist patriarchy, patriarchal capitalism, a dual system of exploitation and oppression or patriarchy as male control over women’s sexuality, fertility and/or labour.” For *postmodernist* feminism, the emphasis shifted away from apparent root causes in material conditions or labor relations, and toward an analysis of the discursive positioning of “women” and “men.” In simpler terms, individuals of any gender are positioned by “discourses”—culturally produced ways of seeing the world—many of which are gendered and discriminatory. The thrust of postmodernist research has been to deconstruct fixed gendered and sexed categories (such as “woman” or “man”), in order to reveal the shifting, fluid, relational, and socially constructed nature of such categories and their associated practices. By showing that gender is not static and unchanging, determined either by biology or capitalist material conditions, postmodernist research has indicated that individuals are agentic and capable of transformation: At different times and in different places, the distinction between women and men should cease to matter. However, Holmes (2007), among

others, has proposed that it remains expedient to retain the categories of “women” and “men” in feminist research, as there is a danger of losing sight of the continuing quest for gender equality and social justice.

Female Experiences

The well-worn slogan of the women’s movement, “the personal is political,” encapsulates a significant trend within feminist research to reveal what is going on in women’s lives (and men’s in relation to women’s). Letherby (2003) argues that this was important because historically, women’s experiences, concerns, and language use were given scant attention by the male research establishment. When they were included, they were viewed in socio-linguistic terms as “not male,” “the other,” and therefore “not the norm” or somehow deviant. Feminist research has therefore been concerned to fill in the missing gaps in “androcentric” history, literature, and academic research by reclaiming and telling the stories of women’s experiences and lives.

“Feminist standpoint epistemology” offers one kind of “successor science” to existing dominant social science paradigms within feminist research. In order to reveal the supposed “truth” of women’s lived experiences, this epistemological approach draws upon a range of qualitative research methods such as life histories, in-depth unstructured interviews, diaries and autobiographical writing. According to Harding (2007), feminist standpoint theory leads to a holistic, integrated, connected knowledge rather than a reductive and analytically orientated, “masculine” knowledge. As a parallel research strand in the gender and language field, Coates (1996) recorded and analyzed how a group of professional women co-construct close friendships by sharing stories, anecdotes, and news. Social constructionist research has since moved on to explore how people of different genders construct and “negotiate” competing aspects of their identities through storytelling, social interaction, and conversation (e.g., Pichler, 2008). Arguably, diversity of *gendered* experience has replaced *female* experience as focal within current gender and language research.

Role of the Author and Reflexivity

Feminist research has been influential within the social sciences for acknowledging a personal responsibility for what scholars write. Traditionally the authorial self has been left out of academic writing in order to convey a sense of authority and academic impartiality. When an author uses “I,” she or he questions traditional styles of academic writing where “we,” “the author,” and “he” are meant to represent distance and objectivity. Weber (1949) was one of the first to argue that the personal and political values of the researcher affect the selection and conduct of research, but his solution was to consider how potential “biases” could be eliminated. This tension between subjectivity and objectivity remains unresolved in feminist research—writers such as Harding (2007) argue for a “strong objectivity” in feminist research in order to correct the omissions and exclusions of traditional positivist research, whereas others, such as Hesse-Biber and Lina Leavy (2007), take the constructivist position that all research is located in the social world and inevitably influenced by it. Such a view questions how the researcher as author is positioned in relation to the research process, and how the process affects the outcome in terms of the choice and design of the research, fieldwork, and analysis, and its editorship and presentation.

The concern to be *self-reflexive*—that is, explicitly self-referential about the researcher’s own values, beliefs, and interests, as well as the choices he or she makes throughout the research process—has become a striking feature of much recent gender and language research. Baxter (2010) for example, discusses the possible effect on respondents of her own gender as an interviewer in her study of female and male business leaders: Male leaders, for example, were keen to demonstrate their “caring side” to her while female

leaders wanted to convey their assertive side. Kamada (2010) examines the idea that she may have changed the lived reality of six mixed-ethnic teenage girls during the course of her research study by arranging opportunities for this group of female friends to meet and talk about their perceived identities on a regular basis: opportunities they might not otherwise have had. Such self-reflexivity is particularly pertinent to feminist research with its mission to “give women a voice”—both those of the researcher and the participants.

Feminist Methodologies

Feminist research in the social sciences, and specifically in gender and language, is characterized by an extraordinary range and diversity of methodologies. There is arguably less variety of approach at the *data collection* stage: Most current research in the field is ethnographic in spirit, involving local, contextualized, qualitative explorations of gender. There are exceptions to this; for example, the increasingly popular use of corpus linguistics involves the analysis of (often) preexisting, large-scale corpora, using dedicated computer software to quantify patterns and trends in decontextualized language (Baker, 2006). Much more typically, however, a researcher will spend time in a natural setting (a home, a classroom, a business meeting, a workplace, a community support group), observe and record linguistic interactions within the setting, and perhaps triangulate or supplement this with other qualitative data, such as semistructured interviews, focus groups, or documentary analysis.

The diversity of research methodologies in feminist research is more commonly to be found at the *data analysis* stage: particularly crucial to the critique of gendered language in context. Harrington, Litosseliti, Sauntson, and Sunderland (2008) have identified at least eight “methodologies” in regular use by gender and language researchers: sociolinguistics, ethnography, corpus linguistics, conversation analysis (CA), discursive psychology, queer theory, critical discourse analysis (CDA), and feminist poststructuralist discourse analysis (FPDA). As an illustration, this entry will briefly consider three methodologies that have had a strong impact on feminist research in the field: a “bottom up” ethnomethodological approach (CA), a “top-down” critical approach (CDA), and a combined dialogic approach (FPDA).

Conversation analysis is a bottom-up approach to linguistic data in the sense that it analyzes how speakers co-construct their lived realities through the sequential organization of naturally occurring talk. In one way, CA appears to be at odds with feminist research in that it does not recognize prior variables or analyst agendas (such as feminism or gender), but asks that linguistic data is analyzed on its own terms. In the late 1990s, CA was reclaimed by and for gender and language study. Feminist conversation analysis aims to systematically identify “the interactional practices that show the relevance of gender as a structuring force in conversation” in order that “the structures and practices are further interrogated for how they may be implicated in social inequalities such as sexism” (Weatherall, 2010, p. 223).

Critical discourse analysis is a top-down perspective of linguistic data in the sense that it has the explicit agenda of deconstructing unequal power relations in spoken and written texts, which are always analyzed within their social context. While this appears to mirror the feminist quest to challenge the basic ideologies and structures that oppress women, many feminist scholars do not identify with CDA as it has arguably foregrounded the social categories of class and race over gender in its analyses. However, Lazar (2005, p. 3) has devoted a collection to “feminist” CDA, which aims to “theorise and analyse the particularly insidious and oppressive nature of gender as an omni-relevant category in most social practices.” Its value for feminist research is that it analyzes language at the

level of the word, sentence, and overall discourse structure in order to make wider generalizations about oppressive gender relations.

Feminist poststructuralist discourse analysis is an explicitly postmodernist approach to linguistic analysis in that it does not critique gender relations in a binary way (“dominant male” versus “dominated female”). Rather, it analyzes how both speakers can shift between different subject positions in the course of a single interaction so that they are at times relatively powerful, and at other times powerless. The value of FPDA to feminist research is that it does not presume a “victim” status for all women or an “oppressor” status for all men, but encourages a more nuanced, multifaceted feminist analysis (Baxter, 2003). FPDA uses a combination of microlinguistic analysis of single interactions and macro-analysis of “gendered discourses” over time, to show how dominant discourses can silence or peripheralize the voices of women—but also to reveal how women can resist such discourses.

Conclusions

Feminist research currently exists in a dynamic interplay between modernist and postmodernist approaches. While modernist scholars conduct research in order to enable change in the lives and conditions of women around the world, postmodernist researchers consider that the quest is more epistemological: to expose the oppressiveness of the category of “gender” itself. Whatever version is chosen, feminist research perceives all stages of the research process as a *holistic* endeavor: from a set of theoretical perspectives to developing a methodology, from analyzing data to producing an interpretation of the findings. The quest to give women a voice—by means of both the research process and the research outcomes—offers feminist research its unique coherence. Feminist research is indeed feminist theory in action.

First Language Development of Grammar

GISELA HÅKANSSON

Introduction

How children acquire language, and in particular, grammar, is a question that has intrigued both scholars and parents for centuries. How is it possible that a young child is able to learn such a complex phenomenon as language? This entry will present research on developmental stages in early grammar and how children learn and overgeneralize inflections. Most examples will be taken from English, but some other languages will also be used as examples.

Research on language acquisition centers on the question of nature versus nurture, that is, how much knowledge children have from the start, and how much they learn from their environment. In a famous debate between the psychologist Burrhus Frederic Skinner and the linguist Noam Chomsky in the 1950s two possible answers were suggested. Skinner claimed that children learn language by generalizing from observations, while Chomsky argued that the input is too “impoverished” for this to be possible, and that children have an innate learning faculty that does the job. For ethical reasons, it is impossible to prove or disprove either of these claims by exposing children to experiments where they are deprived of linguistic input. For the last 60 years, this unresolved controversy has been the root of much empirical research into the development of grammar in children.

Developmental Stages

One question for researchers interested in learning about children’s innate abilities is whether grammar develops in predetermined stages—as in cognitive development. The Swiss developmental psychologist Jean Piaget (1971) identified four maturational stages within a child’s cognitive development, which he termed “qualitative leaps.” A question for researchers of child language acquisition is whether similar stages can be discerned in grammatical development. Some indications of a staged development in language acquisition are found in the transition between “one-word” and “multiword” utterances. Children’s first utterances are short, and follow certain systematic patterns. Around the age of one year, children typically use single word utterances (although the concept of “word” may be different from that found in adult language), for example, *Mommy*, *Daddy*, *Uh-oh*, and *Bye-bye*. This “one-word” stage is followed by a “two-word” stage where utterances like *Read book* and *Mommy read* are common, and then a “multiword” stage, with utterances like *Mommy read book*.

In the 1960s one of the most prominent researchers in the field, the American psychologist Roger Brown, designed a pioneering study together with colleagues Ursula Bellugi and Colin Fraser. The aim was to capture possible stages of language acquisition in more detail by studying children’s grammatical development over time. They studied English-speaking children who had just started producing multiword utterances and

Table 1 Semantic two-word relations in early speech (after Brown, 1973)

<i>Semantic relation</i>	<i>Example</i>	<i>Semantic relation</i>	<i>Example</i>
Agent–action	Mommy read	Entity–locative	Book table
Action–object	Read book	Possessor–possession	Mommy sock
Agent–object	Mommy book	Attributive–entity	Big dog
Action–locative	Sit here	Demonstrative–entity	There ball

recorded them on a regular basis until they had reached a stage where multiword utterances were common. The study was longitudinal and dealt with spontaneous speech data from three children, Adam, Eve, and Sarah, in interactions with their parents. It is interesting to note that the three children differed in age of onset of multiword utterances (Eve, 18 months, and Adam and Sarah, 27 months), but that their subsequent development was the same. One of the analyses outlined by Brown (1973) was based on the concept of semantic relations. He suggested that it is semantic relations that keep early multiword utterances together, such as agent–action (*mommy read*), possessor–possession (*mommy sock*). Table 1 illustrates the most frequent semantic relations found in the two-word utterances of the children. Interestingly, these relations were found not only in English-speaking children, but also in children speaking other languages: other Indo-European languages such as Swedish and Spanish, as well as non-Indo-European languages such as Finnish and Samoan. Such crosslinguistic similarities support the notion of a universal first stage in a semantically based grammar used before syntax commences, a stage that is independent of specific features of different languages. The phenomenon could, however, be alternatively explained by contextual influence—it could be a result of the structures used by caregivers when interacting with children.

In the examples above, what is striking is that the grammatical markers are missing. The children tend to say *Mommy read* instead of *Mommy reads*; *read book* instead of *read the book*, *book table* instead of *the book is on the table*, and so forth. This way of structuring utterances is commonly referred to as “telegraphic speech,” since it is reminiscent of the style used in telegrams, where one would pay for each word. Instead of writing *My train is delayed and I will arrive at midnight* one would write *Train delayed, arrival midnight*.

Grammatical markers, that is, words and inflections, enter the child’s speech as his or her vocabulary grows. It has been observed that when a child’s vocabulary increases there is not only a quantitative increase, but also a qualitative change: Words of different types begin to be used. A child’s earliest vocabulary is dominated by content words from the open classes, such as nouns and verbs, produced in short utterances. Later, closed-class words emerge, such as prepositions, pronouns, and conjunctions. These words are known as grammatical words, since they carry little meaning but instead express grammatical functions. Furthermore, as a child’s vocabulary grows, inflectional markings become more common. It has been suggested that a child needs to know a “critical mass” of words before grammar starts (Marchman & Bates, 1994).

Based on results of the analysis from the three children Adam, Eve, and Sarah (plus some additional data), Brown (1973) suggested a stage model for the development of grammar, a model which is still in use, for example in the diagnosis of language disorders. The model is based on mean length of utterance (MLU), which is a measure of the number of morphemes in a child’s utterances, and on the occurrence of certain grammatical morphemes. Brown’s analysis focused on 14 morphemes, representing both bound (-ing, -s, -ed) and free morphemes (prepositions, auxiliaries, and copula verbs). Together, these measures form five stages in the model: from Stage I with an MLU of 1.75 and very little grammatical morphology; through Stage II with an MLU of 2.25 and using present progressive

-ing, prepositions *in* and *on*, and plural -s; to Stage V with an MLU of 4.00 and all the 14 morphemes. Brown's results indicate that children's grammar is acquired in stages, or by passing milestones, with individual variations in rate but not route of development.

Inflections and Overgeneralizations

Another study on children's innate capacities is Jean Berko's (1958) investigation into the acquisition of inflections. At the time of this study, it was commonly assumed that children learned inflections by memorizing words together with their endings, but Berko's results showed that this was not the case. She designed a test (the Wug test) to investigate the acquisition of English inflections, for example plural (*girl-s*), and tense (*play-ed*), by using invented words such as *wug* and *to rick*, which could not have been heard before, and therefore not memorized by the child. The child was asked to produce these invented words in different contexts. The experimenter presented the child with pictures of objects and said: "This is a wug. Now there is another one. There are two of them. There are two ____." Another example was "Here is a man who likes to rick. Yesterday he did the same thing. Yesterday he ____." The results showed that the children were able to add inflections to a word, and produce forms like *wug-s*, and *rick-ed* even though they had not encountered these words before. Berko's (1958) finding was a breakthrough in language acquisition research, in that it demonstrated in an experimental way that children do not memorize endings, but rather use some kind of abstract rules of inflection. Studies from other languages with obligatory inflectional markings have given the same results: children are able to apply rules to unknown words. When children have discovered how to apply morphological markings, they may even "overuse" the rules and overgeneralize the same markings to all lexical items.

The development from a stage of child language where no inflection is used to a stage of overgeneralization is illustrated in the following examples, taken from the Manchester corpus in the CHILDES database (Child Language Data Exchange System; MacWhinney, 2000). (In the first example the child Carl is one year and eight months old, in the second example he is a year older.)

- (1)
 Carl: in there brum brum.
 Mother: oh it's jumping?
 Carl: it jump.

Notice that Carl is a proficient conversational partner, when it comes to interaction. He plays an active role in the conversation with his mother. Interestingly, he is only partly imitating what his mother is saying, while systematically leaving out certain words, for example the contracted *s* that stands for the copula verb *is* (*it's* becomes *it*). Furthermore, the verb *jump* is not inflected for third person singular (*it jumps* becomes *it jump*). A year later, when Carl is two years and eight months, he uses third-person singular inflections (*wants* and *goes*) and overgeneralizes the regular past tense -ed on come (*comed* instead of *came*)

- (2)
 Mother: I made a big bridge.
 Carl: he wants to go back to the services.
 Carl: and he goes into tunnel and he comed out the tunnel.
 Carl: and he can't see his tunnel.
 Mother: he can't see the tunnel?

The form *comed* is particularly interesting from a theoretical point of view, since it reveals that Carl is not simply imitating adult speech, but rather creating his own system. When children begin to use more and more words with inflections, they tend to go through a period of trying out this rule system in a more systematic way. The rules become over-generalized, and irregular words are treated as regular. For example, English verbs will appear in the form of regular past tense as *comed*, and *breaked*, instead of *came* and *broke*. Some term this developmental process “U-formed learning,” since children may first use the correct form *came* and then the incorrect *comed*, seeming to move backwards, before settling for the correct form *came*.

Crosslinguistic Comparisons

Most research on children’s development of grammar has centered on the acquisition of English by monolingual children. As regards verb morphology it has been found that English-speaking children have an early focus on whether an activity is past or non-past, since this is obligatorily expressed. However, this is not the way time is organized in all languages. Children learning Inuktitut instead have an early focus on the difference between future and non-future. This is because, in Inuktitut, future markers are obligatory whereas past markers are optional. This means that Inuktitut children hear many more verbs marked for future than for past—and therefore use this structure (Swift, 2004). The acquisition of morphology has been discussed a lot in studies of grammatical development in English-speaking children. However, in other languages the acquisition of word order may be a topic of more interest. In the acquisition of German for example, there is an interlocking of verb morphology and verb placement, which has been shown to be an issue of fundamental interest to the field of child grammar development (e.g., Meisel 1992). German children between two and three years of age show evidence of a developmental relationship between the emergence of morphological markings of finiteness on verbs and the placement of the finite verb in the second position of the clause. Before German children start marking finiteness, verbs are always placed in final position, but when they start using finite forms, finite verbs are placed in second position, and infinitives are still placed in final position. In fact, it is suggested (in the universal grammar framework) that the verb morphology triggers parameter setting of “verb-second” (Clahsen & Penke, 1992).

In many parts of the world, documented particularly in Europe and North America, infants are treated as conversational partners from birth. Parents, other adults, and older children spend much time with the baby, talking, chanting, and singing. The particular way of interacting has been labeled Baby Talk (other terms are “motherese” and “infant-directed speech”). For example, significant differences in fundamental frequency and articulation of speech sounds have been found between speech directed to an adult and speech directed to infants (e.g., Garnica, 1977, Kuhl et al., 1997). Grammatical structures are also adjusted. The adjustments are seen in shorter sentences, less subordination, fewer verbs in past tense and fewer first- and second-person pronouns. Baby Talk has been assumed to be beneficial for language acquisition, helping the child analyze the linguistic input. However, cross-cultural studies show that the language acquisition process is robust enough to also occur in other contexts. For example, in families in Guatemala, Samoa, Papua New Guinea, Java, and Inuit communities in Canada, children learn by observing others rather than being involved in verbal interaction themselves (e.g., Ochs & Schieffelin, 1995). In these cultures, the children are not expected to interact, and the adults do not use the typical pattern with high and variable pitch.

Traditionally, most research on first language acquisition has dealt with the development of only one first language, but there are also scholars who study bilingual first language

acquisition, that is, when the child is exposed to more than one language simultaneously from the start (De Houwer, 1990; Meisel, 1990). The results show that children are able to acquire more than one language as first language, in the sense that both (or all three) languages follow the same developmental path as that of monolingual children of the respective language, and also that the bilingual children attain the same native competence. The critical age for acquiring two languages as first languages is suggested to be around three and half years (Meisel 2009).

Summarizing the issue of first language development of grammar, empirical research has shown that the developing grammar grows gradually and it is characterized by stages. Children start with only lexical words, proceed to grammatical words and endings, and continue to complex sentence with embedded clauses. Around the age of three, children seem to have grasped the basics of their grammar. This rapid and smooth development toward the complexities of an adult grammar has been explained by reference to a combination of inborn capacities and language exposure.

First Language Vocabulary Acquisition

EVE V. CLARK

Children produce their first words anywhere between 12 months and 24 months of age. And they add steadily to their vocabulary from then on, at a rate estimated at around nine words a day up to age six (Clark, 2009). However, children understand more than they can produce, so measures of early vocabulary acquisition assess both comprehension and production (e.g., Fenson et al., 1994). At the same time, this comprehension/production asymmetry is life long: speakers of a language consistently understand more varieties than they can produce, and so have a comprehension vocabulary that surpasses what they use themselves in production (Clark & Hecht, 1983). Some researchers have noted a “spurt” in word production in children aged 1;8–1;10 where they start to produce more new words per week than they had in preceding months. However, as McMurray (2007) showed, this apparent spurt does not result from children starting to learn a larger number of words at this point, but rather from their increasing articulatory skill that allows them to add in new words with less practice as they get older. Lastly, neurological studies show that as children become familiar with specific words in their first two years, they show greater left-hemisphere activation for them. In contrast, unfamiliar words show activation in both hemispheres (e.g., Mills, Plunkett, Prat, & Schafer, 2005).

How many words are children aiming for? In English, adult vocabulary size has been estimated at between 50,000 and 100,000 words. Between ages two and six, children acquire around 14,000. After that, in school, they are exposed to some 3000 new words a year from textbooks alone, as well as to new words from a variety of nonschool sources including reading books at home, newspapers and magazines, and radio and television shows. Bilingual children may ultimately learn close to double such numbers, depending on the extent of their language use and literacy in both their languages. In short, children will master a general vocabulary for everyday use plus a range of more specialized domains as they go through school, pursue different interests, and eventually follow a profession.

For each new word, set phrase, or idiom they are exposed to, children must learn the form—this requires being able to identify that form in the stream of speech and retrieve from memory; and they must assign to each form some meaning. They can then identify that form on later occasions as well as adjust the meaning first stored in memory until it matches adult usage. The process of mastering meanings derived from adult uses in context may take several years, but children typically use words as soon as they have assigned them *some* meaning, however incomplete from the adult perspective. In essence, children need to learn the conventions on words and their meanings for the community they belong to, and then observe these conventions as they themselves use the language (Clark, 1993).

In mastering the meaning of a new word, children must master both its reference and its sense: Its reference from adult uses in referring expressions like *the lizard*, and its sense from identifying the other words each such expression is linked to, here for instance: *snake*, *reptile*, *gecko*, *flies*, *sunbathing*, *cold-blooded*, and so on. Meanings are associated with specific forms, such that no two forms carry exactly the same meaning—this is the principle of contrast, and this, along with conventionality, appears to govern both child and adult assumptions about new words (Clark, 1990, 1993).

The earliest vocabularies children acquire are very similar across languages. They consist of words for a few people (e.g., *mummy*, *daddy*, *baby* [the child himself]), some animals (e.g., *dog*, *cat*, *bird*), toys (e.g., *ball*, *block*, *doll*), small household objects (e.g., *light*, *clock*, *key*) and utensils (e.g., *bottle*, *cup*, *spoon*), activities and states (*up*, *down*, *off*, *there* [as completes an action]), and certain routines (e.g., *night-night*, *peek-a-boo*) (Clark, 2009). As children add more words to their repertoires, they extend and elaborate these domains. For example, they add other words for animals, e.g., *mouse*, *horse*, *duck*, *chicken*, then *cow*, *rabbit*, *goat*, *lion*, and so on. In each case, they must learn the adult extension of the new word—what it can refer to and how it is related to other words already known. At first children often over-extend new words, using *dog*, for instance, for sheep, goats, and cats, all smallish four-legged mammals. Over-extensions like this allow children to talk about things for which they lack the relevant conventional terms, and they disappear once children learn the other words they need, e.g., *sheep*, *goat*, and *cat* (Clark, 1973; Thomson & Chapman, 1977). By age two or so, children assume there are words for objects and events, and they become more likely to ask for those words when they lack them.

As children learn more vocabulary and come to analyze the component parts of words—stems and affixes—they also coin words to fill gaps. In English, they construct new nouns—*climber* for “ladder,” *plate-egg* for “fried egg,” *car-smoke* for “exhaust,” and new verbs—*oar* for “row,” *scale* for “weigh,” even *decoration* for “decorate.” This begins as early as age two, and continues lifelong. When children coin new words, they initially make the simplest changes possible in the elements they use. In English, they frequently make verbs from nouns, with no change in word form beyond the choice of inflections. Or they combine two bare nouns in a root compound by adding the appropriate stress pattern (primary + tertiary) to the two elements, as in *gàrden-màn* for “gardener.” Only later do they begin to rely on suffixes like the agentive *-er* or on prefixes like *un-*. They also opt for transparency of meaning, favoring root compounds like *máagic-màn* (for “magician”) or *cár-mènder* (for “mechanic”). Transparency also leads them to avoid vowel changes in an adjective like *volcanic*, where they instead retain the second syllable vowel from the noun *volcano*. Finally, children favor options that are more productive over those that are less productive in adult speech. For new agent nouns in English, for example, they prefer to add the suffix *-er* over the suffixes *-ist* or *-ian*. The options adults favor provide them with starting points for the construction of new words (Clark, 1993).

Adults play a direct role in how children expand their vocabularies. They supply new words all along, at times explicitly and frequently implicitly. Their explicit offers of new words may be flagged by the syntactic frames used to introduce them, e.g., *That's a crab*, *This is called an oatcake*. Adults often then elaborate on new terms they have introduced, with talk about general properties, class membership, allusions to prior experience with the same or some related object, and definitions (Clark & Wong, 2002; Clark, 2007). As a result, adults commonly allude to other words that are closely related in meaning, and so link the new word to these other terms from the same domain. For example, after using the noun *jib*, adults will produce, among others: *mainsail*, *sailboat*, *wind*, *sailing*, *triangle*, *steer*, *rudder*, *water*, *rope*, *spinnaker*, *sheet*, *ratchet*, *hull*, *bottom*, *blow*, and *gaff-rig* (Clark, 2010; see also Hills, Maouene, Maouene, Sheya, & Smith, 2009). This helps children both place new words in the relevant domain, and link them to others they already know.

Adults commonly locate new entities in a domain by talking about their class membership, about their parts and properties, and about their actions and functions. And they do this for new nouns, verbs, adjectives, and prepositions (e.g., Clark, 2010). They also expand their children's vocabularies still further with reading—reading to them, especially early on, and later having them read for themselves (e.g., Davidson & Snow, 1995). Family mealtime conversations provide children with yet another setting in which to extend their vocabulary with discussion, definition, and argumentation (e.g., Beals & Tabors, 1995).

The scaffolding provided by conversational interaction also helps in four- to six-year-olds' acquisition of new science terms in the elementary classroom. Without this scaffolding—talk about what the new terms mean and how they are related to other more familiar words—children fail to learn (Best, Dockrell, & Braisby, 2006).

In short, the more language children hear in conversational interaction, the greater their vocabulary growth. This appears to be particularly important for children's first few years of language acquisition. Hart and Risley (1995) found that the amount of time adults spent talking directly with their children was highly correlated with the children's later vocabulary size and with their general success in school several years later. Of course, parents who talk more to their two- and three-year-olds, will continue to talk more to their five-, seven-, and ten-year-olds as well. So exposure to language, to the greatest extent possible, appears to be critical. While Hart and Risley found a general effect of social class, with middle-class parents talking much more with their children than lower-class or welfare parents, there is individual variation among parents within any social stratum, and this too has an effect on children's vocabulary acquisition. Moreover, children who acquire vocabulary earlier, process familiar words with greater speed, and are thus more receptive early on to dealing with new words as they are exposed to them (e.g., Fernald, Perfors, & Marchman, 2006). More adult talk with children early on is associated with early vocabulary growth and faster processing from an early age.

In summary, children start to acquire vocabulary very early, typically producing their first words early in their second year. And they add steadily to the stock of words they can produce as they get older. The rate at which they add new words appears to depend on the range of words they are exposed to. And the more words they hear in their early years, the larger their vocabularies by the time they enter school. Exposure to how new words are used is critical, and conversational interaction is therefore one of the main routes to expanding a young child's vocabulary. As children get older, conversations are supplemented by reading of all kinds and by exposure to a variety of different settings for language use: books, plays, poetry, film, radio, and TV. But the starting point appears to depend on conversations between adult and child.

Fishman, Joshua A.

LARISSA ARONIN

Joshua Aaron Fishman (July 18, 1926–) is one of the most influential figures in American and world sociolinguistics of the second half of the 20th and of the 21st century. He is the founder of the sociology of language as a separate field of research. As one of the founding figures of sociolinguistics, he has made a substantial contribution as a thinker, editor, and theorist. He influenced several main fields of inquiry: language planning, language revitalization and maintenance, bilingualism and multilingualism, small languages and globalization. Among his 85 books, many monographs, and hundreds of articles and chapters are seminal works on language and ethnicity, language and religion, bilingual education, sociology of Jewish languages, Yiddish, medical anthropology, and test construction.

In 2010 the National Heritage Language Resource Center at UCLA established the Joshua Fishman Award for Outstanding Contributions and Leadership in the Heritage Language Field. In 2004 Fishman was awarded the Linguapax prize (UNESCO). Fishman founded the *International Journal of the Sociology of Language* (De Gruyter) and has been its general editor since 1973. He also founded a major book series in the sociology of language—*Contributions to the Sociology of Language* (De Gruyter)—which he has edited since 1971. Many of his books and articles have become classics and their titles are widely referred to in the sociolinguistic literature; among these are “Who Speaks What Language to Whom and When?” (Fishman, 1965), *Reversing Language Shift* (Fishman, 1991a), and *Can Threatened Languages Be Saved?* (Fishman, 2001).

Born in a Jewish neighborhood in Philadelphia, into a family of Yiddish-speaking immigrants from Czarist Russia who were remarkably devoted to their mother tongue, Fishman grew up exceptionally sensitive and intellectually tuned into Yiddish. At the age of 18, he graduated from Olney High School which had high standards and offered a range of disciplines which fostered Fishman’s multidimensional and multidisciplinary thinking.

The young Fishman was among those few who seriously pursued Yiddish studies, including literature, history, and social issues. In addition to attending public schools he was also studying Yiddish at elementary and secondary levels in a Workmen’s Circle school. In his little free time, at the age of 13, he founded and regularly contributed to a Yiddish youth journal, *Yungtruf*. When this journal’s offices were transferred to New York in the mid-1940s, the editorial board was expanded to include several other activists, notably Uriel Weinreich. The Weinreich family exerted great influence on Fishman. He studied Yiddish with Max Weinreich during the summer of 1948; Max Weinreich became a model of academic excellence. He and his son Uriel involved Fishman in the YIVO (Institute for Jewish Research) committees, conferences, and publications.

Fishman completed his BS (major in history, minor in Spanish) and MS (psychology) at the University of Pennsylvania on a Mayor’s Competitive Scholarship from 1944 to 1948. His PhD dissertation completed in 1953 at Columbia University was in social psychology (“Negative Stereotypes Concerning Americans Among American-Born Children Receiving Various Types of Minority-Group Education”). This comprehensive education, following his rigorous schooling, early experiences, and commitment to Yiddish, governed by his outstanding intellectual abilities, created his unique perspectives on language in society. His natural curiosity and fascination with the multinational and multilingual nature of

mankind as well as a circle of outstanding colleagues and friends—Einar Haugen, John Gumperz, Charles Ferguson, Dell Hymes, and others—stimulated his academic and social activities.

Fishman's professional appointments included a position of educational psychologist for the Jewish Education Committee of New York in 1951 and a postdoctoral fellowship on quantitative methods in the social sciences at Columbia University in 1953 and 1954. From 1955 to 1958 Fishman directed research at the City College of New York (now City College of the City University of New York), where he taught the sociology of language. In 1954 he became responsible for research at the College Entrance Examination Board. In 1958, he was appointed associate professor of psychology and human relations at Pennsylvania University, where he was also the research director of the Albert M. Greenfield Center for Human Relations. In 1966 Fishman accepted a post as professor of psychology and sociology at Yeshiva University in New York, where he also served as dean of the Ferkauf Graduate School of Social Sciences and Humanities (1963–6) and as vice-president for academic affairs (1973–5).

His major work on language-related data started with the revision of the 1960 national US census questions. It was continued and expanded when Fishman received a long-term (1960–4) research grant from the Language Research Section of the Office of Education, which he later took to Yeshiva University. The purpose of this grant was to determine the “non-English language resources of the United States.”

Early Seminal Concepts

Fishman's famous “Who Speaks What Language to Whom and When?” was published in 1965 and since then has served as a basic reference and inspiration in dealing with numerous areas referring to language, its use, and its teaching. The article focuses on patterns of language use within bilingual and multilingual settings. Fishman's first major contribution to the sociology of language was his pioneering work, *Language Loyalty in the United States* (1966), in which, along with the quantitative data, Fishman provided theoretical systematization to language maintenance and language shift.

Domain

Fishman's well-known concept of the domain of language behavior (Fishman, 1964, 1965) evolved from the need to account for patterns of language choice in bilingual communities whereby the use of particular languages in stable bilingual contexts is habitually associated with specific topics, settings, and groups of interlocutors, that is, different domains of use. Fishman defined a domain as a “cluster of social situations typically constrained by a common set of behaviour rules,” and as a “social nexus which brings people together for a cluster of purposes” (1965, p. 75). Fishman maintains that the use of one language rather than another in such situations is not random, and he offers an exposition of the topical, situational, and group regulations of language choice.

Fishman identified five widespread domains: family, education, employment, friendship, and government and administration. His concept of domain provides a way of abstracting general regularities from actual language choice and his domain analysis illuminates patterns of language choice in various contexts in a multilingual society.

Diglossia

In 1967 Fishman extended Ferguson's concept of diglossia by applying it to the alternating use of different languages (Fishman, 1967). He thinks of typological relatedness as irrelevant.

ant in this connection. For him the essential criterion for a diglossic situation is that in such situations language varieties exhibit “compartmentalization”—a clear separation of social functions. He suggests the following four ways in which individual monolingualism, individual bilingualism, and societal diglossia (in his broader definition) operate in speech communities: (a) with both bilingualism and diglossia (e.g., Guarani–Spanish bilingualism in Paraguay); (b) with diglossia but without bilingualism (e.g., the use of classical and colloquial Arabic in Egypt); (c) with bilingualism but without diglossia (e.g., German–English bilingualism in Germany); and (d) (very rare) with neither diglossia nor bilingualism (e.g., monolingual parts of the USA).

Sociology of Language, Societal Emphasis

Fishman is the key figure in the establishment of the field of the sociology of language as a distinct kind of sociolinguistics. Sociology of language is understood as the discipline which focuses on a language’s effect on a society, while sociolinguistics seeks to study the effect of the society on the language. Both fields are closely related. Cumulatively Fishman’s writings from the 1968 onward amount to a coherent and clear theoretical foundation for defining the field of the sociology of language. He dwells on the problems and prospects of the sociology of language, the relationship of macro- and microsociolinguistics, and the question “what has sociology of language to say to the teacher?” (1968, 1972a, 1972b).

Fishman insists that language behavior is social behavior (1972c, p. 358). From early on Fishman realized that the neglect of language use by both linguists and sociologists is detrimental to all fields of inquiry connected with language and society. To face this unmet interdisciplinary challenge Fishman devoted constant efforts to convincing linguists and sociologists of the vital importance of both fields of knowledge to inform, fertilize, and enrich each other. In this connection Fishman calls for the necessity of preparing genuinely interdisciplinary specialists.

Yiddish

Fishman himself considers the most important of all his enterprises to be his intellectual and moral dedication to small and unappreciated languages on all continents, and particularly to his own mother tongue, Yiddish. The case of Yiddish is taken up by Fishman as a private, community, and humanistic matter. The linguistic situation of this non-territorial language involves internal rivalry from Hebrew and external competition from majority languages—English, German, Russian, and, to a lesser degree, Polish. The economic, political, cultural, and demographic factors, and the fact that Yiddish is an Ausbau language with a close linguistic relationship to German, significantly weaken the chances of this small language surviving.

Fishman has been making continuous efforts to support, revitalize, and promote Yiddish. His wife, Gella Schwied, is also committed to Yiddish as a teacher, teacher educator, and poet. In 1980 Fishman edited the special issue of the *International Journal of the Sociology of Language* entitled ‘Sociology of Yiddish’ (Fishman, 1980). The issue contains five articles dealing with Yiddish, including his own article which provides a theoretical analysis of the attaching of high-culture functions to a language of everyday life. Several Yiddish-related publications followed, some in both Yiddish and English, including *Never Say Die! A Thousand Years of Yiddish in Jewish Life and Letters* (1981), *Yiddish: Turning to Life* (1991b), *In Praise of the Beloved Language: A Comparative View of Positive Ethnolinguistic Consciousness* (1996). These works allowed him to develop early on the conviction that weak languages were far from over and done with.

Fishman holds a balanced view of the status of Yiddish today. He believes that only some sectors of the population will use “small” languages for all functions, and that most will just use some of them. It is difficult for Yiddish to perform all the high functions, but there are still a lot of functions available for the small language in order for it to remain of extreme importance to the speech community.

His latest concerns are the enforcement and coordination of language-planning decisions pertaining to Yiddish. He suggests that manifold activities, going beyond moral suasion, could provide a support base in fighting attrition in the face of multiple obstacles.

Fishman also writes a monthly column on sociolinguistics for a Yiddish newspaper, *Forverts* (Yiddish), and regularly contributes to the quarterly *Afn shvel* (Yiddish).

Reversing Language Shift and the Status of Threatened Languages

Fishman as an international authority is best known for his scholarly research and editorial activities in language planning. He was at the forefront of research into language status in developing multilingual nations (Fishman, Ferguson, & Das Gupta, 1968; Fishman, 1974), and since then has discussed and examined many cases of language planning in all parts of the world. His essential writings contain the treatment of all the dimensions and directions of language planning, including language education policy and in-depth works concerning ethnicity, identity, and language (1987, 1999). Fishman reexamined the distinction between status planning and corpus planning and emphasized the huge variation of language situations, societal goals, ideologies, variety of expectations and hopes vis-à-vis language planning (2006).

Fishman’s contribution is especially crucial for the area of reversing language shift—a special branch of language policy which he defined (1991a, 1993, 2001). Research and thinking on Yiddish gave Fishman a constantly self-renewing perspective on minorities which led him to insights into the plight of other small and unappreciated languages. Fighting the assumption that small languages would inevitably decline, Fishman demonstrated the resilience and ability of “small” languages and “little” traditions to survive and creatively adapt.

Human values, feelings, and commitments as well as financial and organizational efforts play a significant role in language revitalization and maintenance; still, they cannot ensure the desired result. It is vital that language be passed on by parents to the child, and through a daily community life. In view of rather frequent failures to reverse minority-language situations despite a range of measures taken, Fishman (1991a) argues that priorities have to be observed in order to successfully halt language decline. A Graded Intergenerational Disruption Scale for Threatened Languages (GIDS) (1991a, 1993) can be used as a sequenced set of such priorities. The scale consists of eight stages or steps (Stage 8 signifies the most threatened situation); it aims to show how far a minority language is disrupted and provide a plan for language reversal.

Globalization, Bilingualism, and Multilingualism

In Fishman’s comprehensive theoretical outlook, minority language interests coexist harmoniously and are reinforced by a global perspective. In “The New Linguistic Order” (1998) he identifies the crucial trends in the radically changed world—the unprecedented spread of English and its role, and the remarkable diversification of languages in use. Fishman writes on national languages and languages of wider communication (1972c),

and on the nuances and realities in the use of English as a global language (e.g., Fishman, Conrad, & Rubal-Lopez, 1996). He also deals with multilingualism in New York City in a book coedited with Ofelia García (García & Fishman, 2002). His diverse body of work constitutes a comprehensive harmonious view on world languages from social, philosophic, ethical, ethnic, moral, historic, and personal perspectives.

Fishman has been associated with many universities and research centers. His visiting appointments and fellowships include those at the Center for Advanced Study in the Behavioral Sciences (Stanford University) and the Institute for Advanced Study (Princeton University); he has been visiting professor and visiting scholar at the School of Education, Applied Linguistics and Department of Linguistics (Stanford University); adjunct professor of multilingual and multicultural education at the School of Education (New York University); visiting professor of linguistics at the City University of New York Graduate Center. Fishman is a "Distinguished Research Professor of Social Sciences" at Yeshiva University (1966), professor emeritus (1988), a Linguistic Society of America professor (1980), and an honorary doctor of letters at the Free University of Brussels (1986).

Flege, James

THORSTEN PISKE

James Emil Flege was born in Cincinnati, Ohio, in 1950. He obtained a PhD degree in linguistics from Indiana University in 1979. His PhD dissertation, supervised by Robert F. Port, was entitled "Phonetic Interference in Second Language Acquisition." From 1980 until 1982, Flege worked as a postdoctoral trainee in speech and hearing sciences, first at the University of Florida and then at Northwestern University. In 1983, he joined the Department of Biocommunication (later known as the Division of Speech and Hearing Sciences), a clinical and research unit at the University of Alabama at Birmingham (UAB). There he set up a large-scale research program funded by several grants from the National Institutes of Health in order to investigate how, and to what extent, the ability to learn speech and language changes across the lifespan. After publishing more than 90 journal articles and 18 book chapters and establishing himself as one of the most, if not the most, influential researcher in the field of second language (L2) speech learning, he retired from UAB in July 2006. Throughout his career Flege's success at obtaining research grants allowed him to collaborate with colleagues such as Ian R. A. MacKay and Grace H. Yeni-Komshian in large-scale studies examining immigrant populations, and to invite young researchers from North America, Europe, Australia, and Asia to work in his laboratory. His former postdoctoral fellows, whose research has been strongly influenced by his ideas, include Ocke-Schwen Bohn, Susan Guion Anderson, Anders Højen, Satomi Imai, Serena Liu, Diane Meador, Murray J. Munro, Thorsten Piske, Anna Marie Schmidt, Kimiko Tsukada, and Ratree P. Wayland.

Most of the work carried out in Flege's laboratory was devoted to the field of L2 speech learning. According to Flege (1988, p. 226), this field examines the processes by which language learners come to "articulate or perceive a speech sound differently after (as compared to before) massive exposure to a foreign language." For the last 30 to 40 years, the role of different variables in L2 speech learning has been investigated in many increasingly detailed experimental studies. Many of these have examined the effects of "subject" variables on immigrants' success in learning to perceive and produce the sounds of an L2. Among these Flege has mainly focused on age-related variables, such as the age of first intensive exposure to the L2 (hereafter referred to as age of L2 learning), the quantity and quality of the L2 input learners receive, first (L1) and second language use, amount and type of L2 instruction, and motivational and affective variables (e.g., Flege, Munro, & MacKay, 1995). Many of the studies carried out by Flege and his colleagues have also investigated the influence of phonetic variables on L2 speech perception and production. These studies have produced important findings showing how the similarities and differences between L1 and L2 phonetic systems may affect the process of L2 speech learning (e.g., Bohn & Flege, 1992; Aoyama, Flege, Guion, Akahane-Yamada, & Yamada, 2004). Some of this work has shown that L2 speech perception and production are not only determined by subject and phonetic variables, but that they are also dependent on "contextual" factors such as the speaking rate at which speech samples are produced or the lexical frequency of the test words used in an experiment (e.g., Schmidt & Flege, 1996; Imai, Walley, & Flege, 2005). Finally, in a few studies Flege has addressed the role social factors, such as a learner's ethnic identity or varying attitudes toward foreign accents, play in the perception and production of L2 speech (e.g., Flege, 1987).

DOI: 10.1002/9781405198431.wbeal0416

Since the late 1980s and the mid-1990s, research in the field of L2 speech learning has been stimulated by the two most influential theoretical constructs in the field: Best's perceptual assimilation model (Best & Tyler, 2007) and Flege's (2003) speech learning model (SLM). Both models hypothesize that the learners' success perceiving (and producing) non-native speech sounds depends on the perceived relationship between sounds in their L1 and the L2. The major purpose of Flege's SLM is to account for age-related changes in L2 speech learning. A core tenet

is that L2 learners of all ages can auditorily detect cross-language phonetic differences, and that they retain all of the original capacities used during L1 speech learning, including the ability to establish new representations and to convert the sensory-based information stored in perceptual representations into articulation. (Flege, 2009, p. 177)

In many of their studies, Flege and colleagues have put the different hypotheses of the SLM to empirical test. The results of these studies have shown that compared to immigrants who begin learning an L2 in late adolescence or early adulthood, those who start in childhood usually have a better overall pronunciation of the L2 (e.g., Piske, MacKay, & Flege, 2001), have a better pronunciation of L2 vowels (e.g., Flege, MacKay, & Meador, 1999) and consonants (e.g., Tsukada et al., 2004), identify L2 consonants better (e.g., MacKay, Flege, Piske, & Schirru, 2001), and discriminate English vowels more accurately (e.g., Flege & MacKay, 2004). On the whole, then, these findings show that the earlier an L2 is learned, the more native-like its pronunciation and perception will usually be. However, Flege's work also shows that early exposure to an L2 is insufficient in itself to guarantee native-like perception and production of the L2 (e.g., Flege, Frieda, & Nozawa, 1997; Højen & Flege, 2006) and that a learner's success in perceiving and producing the sounds of an L2 is also dependent on factors other than age of L2 learning. These factors include amount of continued L1 use (e.g., Piske et al., 2001), quantity and quality of L2 input (e.g., Flege & Liu, 2001), and training in the perception and production of the L2 (e.g., Flege, 1989).

Another important finding of Flege's studies is that bilinguals who perform well in the L2 sometimes do not perform equally well in their L1. For example, MacKay et al. (2001) reported that several native Italian learners of English who produced the English /b/ consonant accurately, did not produce the Italian /b d g/ consonants with the prevoicing that characterizes Italian stop consonants produced by monolingual speakers of Italian. Moreover, Flege, MacKay and Piske (2002) observed that native Italian immigrants to Canada who were dominant in English showed difficulties in translating English sentences into Italian. Such findings suggest that as bilinguals gain experience with an L2, their abilities in the L1 will most likely also be affected by this experience so that over time they may show signs of L1 attrition.

Much of Flege's work has yielded findings that are consistent with the major predictions of the SLM. For example, the studies examining the perception and production of L2 speech sounds have supported the prediction that production accuracy is limited by perceptual accuracy. Moreover, careful examinations of the L2 performance of learners who began learning an L2 either in childhood or in late adolescence/early adulthood have usually supported the view that age-related effects in L2 speech perception and production are not due to the passing of a neurologically based critical period, but that they arise from changes in how bilinguals' L1 and L2 phonetic systems interact across the lifespan, and that how the L1 and L2 systems interact depends on the state of development of the L1 phonetic system at the time when L2 learning begins.

Flege's research has not focused exclusively on questions pertaining to the perception and production of L2 speech sounds. In a few studies, he and his colleagues have also examined the effects of different subject variables on the acquisition of L2 morphosyntax

(e.g., Flege & Liu, 2001). Findings from these studies suggest that success in acquiring the grammar of an L2 is determined by variables substantially correlated with age, but not by age of L2 learning itself. They suggest that success in L2 grammar learning depends upon the amount of time L2 learners spend in schools where the L2 is the medium of instruction, the amount of time spent using the L2, and the amount of L2 input received from native speakers. Like the results obtained in research examining L2 speech perception and production, these results support a view Flege has repeatedly expressed in his articles, that is, that researchers should not be “dogmatically committed” to just one predictor of L2 learning, but rather that they should acknowledge that successful L2 learning is dependent on a wide variety of variables that are often confounded (e.g., Flege, 2009, p. 189).

In summary, James Flege’s research has provided invaluable insights into the nature of L2 speech learning and produced many important findings regarding potential sources of variation in L2 learning in general. It has also been highly influential in establishing methodologies that are now used by many L2 researchers. We can, therefore, be sure that Flege’s ideas will continue to stimulate research in the field of L2 learning for many years to come.

Fluency

PAULINE FOSTER

Introduction

Though the term “fluency” may apply equally to the language skills of reading, writing, or listening, it is most commonly applied to speaking. Fluent speech can be defined simply as that which flows easily without noticeable pausing or backtracking. Lennon (2000, p. 26) goes further: in addition to being rapid and smooth, fluent speech is the lucid and efficient translation of thought into speech. Fillmore (1979) goes further still: fluent speech is easily produced, coherent, creative, imaginative, and appropriate. We can see in these definitions that fluency is closely associated with what we might otherwise call eloquence, but while not everyone can claim to be eloquent, most of us are able, most of the time, effortlessly to string words together grammatically without needing to pause frequently or abandon unfinished phrases. This is so universal in humans that it is hardly noticed, but it is an extraordinary skill. Adult native speakers of English, for example, have an everyday vocabulary in excess of 30,000 words (Field, 2004, p. 283) and can select, retrieve, combine, and articulate them in grammatical strings at a rate of between 100 to 240 words per minute. To put this another way, Goldman-Eisler (1968) reported articulation rates of between 4.4 and 5.9 syllables per second. Humans can converse at these speeds for hours without fatigue, making only the occasional slip, estimated by Field to occur only once per 1,000 words. This is evidence for a very efficient storage and retrieval system. When it fails, as it very occasionally does, the speaker is left struggling to recall a word which she knows full well is stored in her mental lexicon. Known as the *tip of the tongue* phenomenon, it stops an utterance mid-stream and sets the speaker off on what can be a determined search.

Fluency and Models of Speech Processing

Currently the most influential model for speech processing is Levelt’s (1989, 1993). It has three serial components for speech production: the *Conceptualizer* acts as a preverbal stage where ideas to be expressed are selected and organized; the *Formulator* is where these ideas are encoded into linguistic form through the retrieval of the required words and grammatical structures; the *Articulator* then translates these forms into a phonetic plan which is executed by the neuromuscular system controlling the vocal tract. Obviously, for this model to deliver fluent speech there has to be a degree of parallel processing. If this were not the case speech would be characterized by very frequent pauses as articulation waited upon the next concept to be hatched and delivered for formulation, and conceptualization of the next idea would be waiting upon articulation of the previous one to be complete. For smooth and rapid speech, conceptualizing a prelinguistic idea proceeds while the previous one is in the process of being articulated, and formulation operates on partially complete information as the Conceptualizer feeds in what is to be said rather than waiting for the Articulator to catch up. For native speakers at least, parallel processing of ideas and articulated speech can be achieved easily because the necessary grammatical

and phonological encoding draws on automatized linguistic knowledge which can be accessed and executed very fast.

The speed of native speaker speech poses a problem for a generative model of language which gives a central position to the creative power of syntactic rules (e.g., Chomsky, 1965). But as Pawley and Syder (1983) and many others since have pointed out, while this model of language predicts the generation of an infinity of novel and grammatical utterances, in practice nothing of the kind is seen. Rather than using their grammatical competence and large vocabulary to generate completely innovative combinations of words, humans everywhere produce utterances made up of combinations that others in their speech community use. There are many kinds of these, including fixed phrases (*It's a question of priorities*), sayings (*There's no time like the present*), metaphors (*as nice as pie*), collocations (*flatly refuse*), phrasal verbs (*get along with*), and partially fixed phrases that require the insertion of one or two words (*that's the last time I'll ever ask x to y for me*). Native speakers of English who produce any of these have not constructed the expression from scratch, using their knowledge of rules and vocabulary, but have retrieved them as chunks of words stored whole in their memory. Novel paraphrases (*no time is similar to the present, equal to pie in niceness*) might well be grammatical, but they are obviously bizarre and highly unlikely ever to be produced.

The careful collection in the last 25 years of huge corpora of authentic language samples and the development of computer software than can analyze them have revealed the remarkable pervasiveness of this phenomenon in both speech and writing. Reviewing the evidence from corpus analysis, Sinclair (1991) concluded that language processing was guided in the main not by grammatical principles but by an idiom principle whereby utterances are constructed from collocational patterns. If this were not the case, and if humans were routinely coming out with novel combinations of words, they would presumably have to speak more slowly because it would take longer for Levelt's Formulator to build an utterance one word at a time. But if we see speech as the chaining together of fixed or partially fixed strings of words selected whole from memory, then the remarkable fluency of native speakers is accounted for.

Extreme rapidity of speech rate, such as exhibited by cattle auctioneers, who have been shown to reach speeds of 400 words per minute (Crystal & House, 1990), is only possible when the language is made up, entirely in this case, of fully predictable, highly ritualized, formulaic chunks. A professional auctioneer has practiced saying such formulae over and over again, and he is comprehensible to his audience because they are completely familiar with such formulae and do not have to decode them word by word. By contrast, the health warnings delivered at a very high speech rate at the end of American television commercials for pharmacological products such as painkillers are not highly ritualized except for the final breathless, "*Use only as directed.*" As a result, the exact content of the warning can be very hard to comprehend. Comprehensibility is not, however, the issue. Advertisers might be obliged to broadcast the contraindications of their product, but they are not obliged to do so at a speech rate which viewers can follow. This is the auditory equivalent of small print.

Patterns of Pausing in Speech

So far we have discussed fluency in terms of ease of completing an utterance without noticeable pausing. The word "noticeable" is important here. A stream of speech which might strike a listener as very fluently delivered will nevertheless contain many pauses. There is considerable evidence (Pawley & Syder, 2000) that when speakers pause they are more likely to do so between clauses rather than in the middle of them, delivering fluent runs of syntactically complete units. The slight deceleration of speech rate at the approach

of the clause boundary, the pause before the next clause starts, and the slight acceleration of speech rate as the next clause is delivered is evidence for a model of speech planning in which clause-length units of language are encoded one at a time, using partially or fully prepackaged chunks.

When speech is closely transcribed, the pauses and repeated words can make it look far more dysfluent than it sounded to the listener. To illustrate, here are two short transcripts from a BBC discussion program; the pauses are measured to the nearest half second, with those less than half a second shown as (.):

They are saying, look (1.0) we want to try try to dodge some of the difficult decisions (.) on tax and that means the (0.5) cuts to public spending (.) will be much bigger (.) as a result.

Disposing rubbish is really really expensive a really really expensive business (.) we face we face massive fines from the EU if we don't if we don't recycle, you'll you'll have huge increases in your council tax bill so (.) let's actually get on and recycle (.) let's reduce the amount of of of rubbish. (BBC, *Daily Politics*, June 2010)

Both of these are examples of extemporaneous, relatively unplanned speech. But even when speech is carefully prepared beforehand, the speaker might still insert a few pauses and repeat a few words in order to come across as more natural. Occasional hesitations do not mar speech. In fact, they aid the process of comprehension. Coupled with intonational rises and falls, they helpfully spell out for the listener the syntactic framework of the utterance as it is delivered. Someone speaking without pausing at all (except to breathe, of course) might strike the listener as rather indifferent to being understood, or perhaps distressed, or else determined not to let anyone else get a word in edgeways. But while short pauses are normal and necessary, long ones are not. According to Jefferson (1989), pauses in English conversation that last for 1.0 second and more become noticeable periods of silence in the speech stream, something which speakers try to avoid unless they are trying for a dramatic effect. Silence is so dispreferred that unfilled pauses of more than 1.0 second will invite the listener to step in and fill them by starting their own turn. To prevent this, speakers fill pauses with little place-holding sounds (*er* or *um*) or else with such expressions as the sometimes maligned *you know*, *like*, *I mean*, and *sort of*. These signal that the speaker has perhaps decided to abandon the formulation of her current utterance midway in order to start again, or perhaps is still trying to complete the formulation of a thought by, for example, finding just the right word. The same place-holding effect can be achieved through repetition of a word or phrase while the next part of the utterance is made ready to articulate, as illustrated in the two transcripts given above. Dysfluencies, such as false starts, repetitions, and assorted fillers, are testament to the fact that speakers monitor what they are saying “online,” and may have to pause and restate something which is not a satisfactory formulation of their thought. It is only when these come thick and fast that speech becomes noticeably, and perhaps annoyingly, dysfluent.

In an ordinary conversation most people, most of the time, construct their turns in ways which maintain fluency between speakers. When conversational analysis was first undertaken in the 1970s, researchers such as Sacks, Schegloff, and Jefferson (1974) showed that, in English at least, when two or more speakers are conversing their turn taking conforms to certain rules that minimize inappropriate interruptions, sudden changes of topic, or embarrassing silences. Constructing sequences of utterances across turns requires skillful timing and anticipation of so-called “transition relevance points,” where one speaker stops and another starts. A fluent conversation is one in which changes of speaker happen with minimum overlap and minimum gaps.

All normally healthy people are more or less fluent in producing speech, but some are clearly more fluent than others. It is important to consider therefore the extent to which the ability to construct a stream of speech without undue hesitations, pauses, or false starts is a stable characteristic of a given individual speaker, or something affected by the context. For example, some people obviously have a slower than average speech rate, or typically change tack mid-phrase, or pepper their utterances with filled pauses no matter what they are talking about or who they are talking to. Others are able to produce smoother or faster than average speech regardless of circumstances. These stable characteristics might reflect individual differences in working memory capacity, or individual predilection for “online” monitoring and adjusting of utterances in progress. However, a speaker’s dysfluency can reflect also a deliberate choice on their part in order to appear truthful, cautious, respectful, or unthreatening as the context demands. Glibness, after all, is a pejorative synonym for fluency which suggests insincerity, superficiality, or a lack of concern, and is something therefore to be avoided. But because a speaker who is dysfluent may be seen to be betraying nervousness, or even guilt, a fine line needs to be trod between being too fluent and not fluent enough.

An extended silence can denote something menacing or unpleasant. In this example from Frankel (1984, p. 3) the doctor’s 2.2 seconds of unfilled silence conveys very bad news:

- Patient: This chemotherapy (0.2) it won’t have any lasting effects on havin’ kids, will it?
 Doctor: (2.2)
 Patient: It will?
 Doctor: I’m afraid so.

Schoolchildren learn early on that answering a teacher’s question with unfilled silence is a safe way of being disrespectful. Other marks of dysfluency (hesitations, slow speech rate, repetitions, filled pauses) can be also be deliberately employed by a speaker to add another layer of meaning to what they are saying. For example, these show respect for the listener, or tactfulness if the listener is in an embarrassing situation. They show a proper tentativeness in asking for favors or in negotiating a delicate matter. When complex instructions are being given, slow and repetitious speech allows the listener time to understand properly. Slow speech can simplify messages for the very young, or the very confused. Used inappropriately, however, such a speaking style can be very patronizing. “Elderspeak” is the term used to describe the slow (and loud) register which some people seem to shift into when talking to the elderly, regardless of whether the person is deaf or not, or mentally impaired or not.

Language Pathology

Medical conditions can have obvious effects on fluency. Disease or damage to the left hemisphere of the brain, where the language centers are usually located, result in aphasia, or problems in converting thought to language. In Broca’s aphasia, the sufferer, despite understanding language normally, has the greatest difficulty constructing utterances and her speech becomes very slow and very labored, as if she were in a permanent “tip of the tongue” state. In Wernicke’s aphasia, by contrast, the sufferer produces streams of speech which are very fluent, but which lack coherence, as if (using Levelt’s model) the Formulator does not organize thought properly, sending instead very garbled strings to the Articulator, which faithfully produces them. Sufferers of Wernicke’s aphasia have comprehension problems also, and so are tragically unaware that their speech is incoherent. As far as they

know, they are speaking normally and fluently and are frustrated when others fail to understand them. Conditions such as Parkinson's disease, cerebral palsy, and muscular dystrophy do not affect the language centers in the brain, but cause dysarthria or weakness of the facial muscles, leading to frustratingly slow or uncoordinated speech.

Perhaps the most common medical problem affecting fluency in speech is stammering (also known as stuttering). While everyone produces hesitations, false starts, and repetitions to some small degree, stammerers can produce an inordinate number of these, some lasting a painfully long time before the speech stream is resumed. It is accompanied by tension and embarrassment, which combine to make the problem worse. There is no one defined cause for stammering. It is thought to arise from a combination of genetic, neurophysiological, and developmental factors, and there is no defined therapy. Fortunately, it is far more common in children than in adults, so in most cases it does resolve. However, it is estimated that 1% of adults in the United States have a persistent stammer, with men outnumbering women by a ratio of three to one (www.stutteringhelp.org).

Fluency in a Second Language

So far, we have considered fluency only from the perspective of native speaker performance. From a second language learner's perspective, fluency is most often viewed as a measure of overall proficiency because their knowledge of the language can be reflected in the speed with which they can use it to formulate and articulate thoughts (de Bot, 1992). People who are beginners in a second language speak slowly and hesitantly, and often lose their way in an utterance, perhaps abandoning it or switching into their first language to avoid communication breakdown. They may have difficulty with pronunciation and need to articulate words with conscious effort. As they acquire greater knowledge of the grammar and vocabulary, and greater ease in pronunciation, their speech rate typically goes up, the incidence of hesitations, revisions, and pausing goes down, and the number of words they produce between pauses increases, all of which is evidence for increasing automatization.

Investigations of fluency in second language acquisition (Skehan & Foster 1999; Derwing, Rossiter, Munro, & Thomson, 2004) use measures such as speech rate, pausing, false-starting, lexical replacements, and syntactic reformulations to explore how learners' performance changes across time or across task and discuss their findings in terms of how they illuminate influences on second language development. Pausing is especially interesting in this regard. As noted above, native speakers have been shown to punctuate their stream of speech with pauses more often at clause boundaries than in the middle of them. But second language learners are just as apt to pause in the middle of clauses as at the end of them. This is a function of three problems involved in using an imperfectly known language: lack of secure and automatized knowledge of grammatical structures; insufficient store of individual vocabulary items; and insufficient store of partially or fully formed sequences of vocabulary items. All conspire to make frequent and untimely pausing inevitable. As a learner's knowledge of the language increases and becomes more secure, pausing in the middle of clauses decreases, and length of run (i.e., how many words are strung together between pauses) grows longer.

It is important to bear in mind, however, that second language learners have been language users since childhood, and if they are relatively dysfluent in their first language they are likely to be dysfluent in their second language for exactly the same reasons. Fluency is prized in second language assessment as a sign of how much a learner knows, while dysfluency is taken as a measure of what he doesn't know or knows only imperfectly. As we have seen, it may equally be a sign of an individual speaker's natural speaking style, or an individual speaker's decision to give an impression of deference or thoughtfulness.

An important issue for second language assessment is to distinguish between a learner's ease of production and his eloquence, that is, the coherent, creative, and imaginative use of the language that Fillmore (1979) included as dimensions of fluency.

The ability of speakers fluently to encode ideas into speech, and of listeners fluently to decode speech back into the thought that inspired it, is a remarkable skill which only the human species has evolved. It would not be nearly so remarkable if it were as slow as, for example, the laborious spelling out of words in Morse code. Its speed means we can talk nearly as fast as we think, and we can decode even faster than that, able to predict the end of someone's utterance before he gets there, and even finish for him if he falters. The rapid and efficient exchange of information on a limitless scale gives the human species a powerful adaptive advantage and might be described as its most important defining characteristic. Most of us, most of the time, take fluency of language so completely for granted that we scarcely notice it. When it is compromised, as in the case of brain damage, disease, or physical trauma to the vocal tract, it is a profoundly distressing disability.

Focus Groups

DEBBIE G. E. HO

In a church meeting room, a group of widows compare their experiences. One woman complains that other people wanted her to stop grieving within six months but that it really takes much longer. Another woman produces murmurs of agreement throughout the groups when she adds that the second year is sometimes harder than the first (Morgan, 1989).

In Chicago, a group of young African American mothers talk about what it is like to be on welfare. They all agree that it is a hard life, but to hear them tell it they have what it takes to get along despite their obvious problems. Still, as the discussion wears on, their stories are more and more about how hard it is and less about their own ability to rise above their circumstances (Jarrett, 1993).

In a school in Brunei, a non-native English-speaking country in South East Asia, a group of senior high school students talk about their English classes. Most complained about the monotony of lessons and the assessment system in the school. Despite their complaints, the students lamented about their low grades and how this would affect their chances of getting a job or further education (Ho, 2006).

Each of the above examples describes a piece of research using focus groups. As can be seen, a focus group is not just a group of people coming together to talk. Rather, it is a small structured group with selected respondents normally chaired by a moderator. Specifically, focus groups are special groups in terms of size, purpose, composition, and procedures. They are specially set up to explore specific issues and respondents share and respond to comments, ideas, and perceptions brought up in interactive group discussions. It is thus, a “carefully planned discussion designed to obtain perceptions on a defined area of interest in a permissive non-threatening environment” (Krueger, 1994, p. 6).

Two key characteristics are exhibited in focus group interviews—it is focused in that it is a collective activity around a small number of specific issues (e.g., welfare system, abortion), and it is interactive, where group dynamics and forces are crucial to successful discussion. These two characteristics make a focus group interview a potentially powerful qualitative research tool in the social sciences. Here, respondent responses are not limited by a set of predetermined questions and the interviewer does not take a leading role as that found in traditional interviews. Thus, respondents are encouraged to disclose information that could be of the highest value to the research.

Originally dominant in marketing research (e.g., Hayes & Tatham, 1989; Greenbaum, 1993), focus group interviews were not known to social scientists up until about a decade ago. Today, research in the social sciences, education, and even health science using focus groups is appearing in academic journals at an increasing rate (Kitzinger, 1993; Morgan, 1997; Ho, 2006).

Is It the Right Method for Your Research?

Among all the research methods in the social sciences, it is important for a researcher to gauge from the outset if a focus group interview is the right method for his or her type

2 FOCUS GROUPS

Table 1 The appropriateness of focus group interviews

<i>Focus groups are useful for:</i>	<i>Focus groups are not useful for:</i>
• finding new information (e.g., a new product) and consolidating old information (e.g., examining people’s habits) • gaining a variety of perspectives on a topic from respondents themselves (i.e., their beliefs, views, attitudes, motivations, etc.) • exploring respondents’ shared experiences of everyday life (e.g., language use, culture, etc.) • brainstorming and generating ideas resulting from respondents providing different angles to problems and offering different solutions • exploring controversial and complex issues (e.g., Chiu & Knight, 1999).	• research that seeks for consensus of opinions or looks to educate people • seeking sensitive information that should not be shared in a group • statistical projections • polarized issues where a group discussion could intensify the conflict • research where other methodologies can produce better quality information more economically • sensitive topics where it is difficult to ensure the confidentiality of data produced.

of research. Table 1 provides a clear summary of when it is and when it is not appropriate to use focus group interviews (Krueger & Casey, 2000; Litosseliti, 2003).

How to Organize a Focus Group

The key areas to consider when planning a focus group interview are the selection of respondents, the drawing up of an interview guide and the role of the moderator.

Selecting Respondents

Here, the emphasis is on getting “information-rich” respondents (Krueger & Casey, 2000), “those from which one can learn a great deal about the issues of central importance to the purpose of the research” (Patton, 1990, p. 169). The crucial question is: “Who has the greatest amount of insight on this topic?” Some focus groups consist of different types of people who can give information on a topic from different perspectives (e.g., getting parents, teachers, food service people, and students to talk about what nutritional foods should be served in elementary school canteens). Focus groups generally consist of between six to twelve people, although there is no fixed rule on group size. Too few, however, may not yield sufficient data while too many may not give enough opportunities for all individuals to contribute.

Designing the Interview Guide

The interview guide sets the agenda for the group discussion. It should incorporate contributions from all who have a stake in the research under study. Although, the moderator may not be the sole person responsible, she or he nevertheless needs to be brought into the designing process of the interview guide in order for him or her not only to be comfortable with the instrument, but also to understand the intention behind the questions.

Interview guides are organized in such a way that questions are less structured and the length of discussion is neither too long nor short. Lengthy discussion on a topic could be exhausting for the respondents. Moreover, questions are sequenced so that general, unstructured questions usually come first and more specific ones are placed at the end. They are also flexible to allow for the nature of a focus group to operate. Examples of the type of questions are: *how do you feel about XYZ? What thoughts went through your head while you watched the program?* It is important that the moderator not “lead” or influence the respondents in any way but to let them talk about their own experiences, feelings, and attitudes.

Sometimes, a researcher may pretest the interview guide before actually using it, either through a mock focus group interview or individuals. Pretesting the guide provides an opportunity to determine if the wording of a question is appropriate and easily understood.

The Focus Group Moderator

As moderators deal with the dynamics that constantly emerges during a focus group discussion, they play a key role in its success. They must know how to handle the “rational man” syndrome (Scott, 1987, p. 35) where respondents tend to give the “right” and “socially acceptable” responses as opposed to those that reflect their actual feelings and viewpoints on the issue under discussion. Also a good moderator is able to gently draw respondents into the discussion, encourage them to interact with one another, let the discussion flow naturally with little intervention and listen well without being judgmental or authoritative. Included among the personal traits of good moderators are qualities such as empathy, openness, insightfulness, and flexibility. Further information on what makes good qualitative moderators can be found in Stewart and Shamdasani (1990).

Figure 1 Stages of a focus group interview

Conducting a Focus Group

There are basically three main stages to conducting a focus group interview: before group session, during group session, and after group session. Figure 1 sets out a general overview of the transition of stages in such interviews.

Analyzing Focus Group Data

Because of the open-ended nature of focus group interviews, the analysis and interpretation of findings require judgment and care (Frankland & Bloor, 1999). In this section, we will consider first the possible types of data that form the basis for analysis before going on to the methods of analysis most frequently used with such data.

Types of Data as Basis for Analysis

One type of data commonly used is data from an unabridged transcript, supported by field notes taken by the researcher. The transcript could run anywhere from 30 to 50 pages.

The second type of data could be that extracted from a tape recording of the discussion. The result is an abridged transcript, which is less time consuming than the transcript-based strategy. The focus here will be a careful listening to the tape recording of each focus group, then developing an abridged transcript condensed to the relevant and useful sections of the discussion. The analyst, however, must have a thorough understanding of the purpose of the study to develop an abridged transcript. The transcript may be between 15 and 30 pages.

The third type of data is note-based data which relies mainly on field notes with audio and video recordings as support data. This type of data can be speedily obtained, although its quality will depend upon the ability of the assistant moderator in capturing relevant information. The moderator's notes may be sketchy and incomplete because she or he had to concentrate on the discussion. The note should distinguish between instances of direct quotes and the note taker's paraphrases of respondents' comments.

Methods of Analysis

One quick and cost-effective method of analyzing a transcript is the cut and paste technique or what Krueger and Casey (2000, p. 132) call the "long-table approach." Frequently, this method relies heavily on a single analyst who determines which segments of the transcript are significant, develops a categorization system for the data gathered, decides on representative statements, and then interprets them. The result is a high level of subjectivity and potential bias. For a more reliable analysis, multiple analysts could be recruited to code the transcript independently before a consensus is reached. Steps in applying this technique can be found in Stewart and Shamdasani (1990) and Krueger and Casey (2000, pp. 132–7).

Another common method is the use of content analysis. Here, key points in the discussion are identified and then categorized. Categories are exclusive and well defined in that all statements must fit into one category rather than many categories (Gillham, 2000). Content analysis is an interpretative approach and therefore includes extracting examples from the data. Today, computers are used to assist in content analysis which helps to reduce the time-consuming and tedious task of data making.

One other method of analysis worth noting is data indexing. Here, pieces of data from the transcript are not assigned a single code, nor are they given a final and absolute interpretation. Rather than the exclusive coding of material, each piece may be assigned

Table 2 Strengths and weaknesses of focus groups

<i>Strengths of focus group interviews</i>	<i>Weaknesses of focus group interviews</i>
• Provides for a large amount of data quickly and at less cost than individual interviews. • Provides immediate opportunities to clarify responses, for follow-up questions and for probing responses. • Allows for varied and different viewpoints/perspectives within an interactive group. • Can be used to explore a wide range of issues/topics, even complex behaviors and phenomena. • Can be used for obtaining data from children, nonliterate individuals, and “marginal” groups. • Good as primary or supplementary sources of data during the initial or late stages of a research study. • Acts as a compromise between participant observation and individual interviewing as it is less controlled than traditional interviewing and more controlled than participant observation.	• Biased data due to group influence and dominant members. • Analysis and interpretation of findings may be subjective due to the open-ended nature of focus groups. • Susceptible to moderator bias and manipulation leading respondents to respond to his/her own prejudices. • Difficult to make generalizations due to limited number of respondents and lack of representative samples. • Requires considerable logistic effort (e.g., Crabtree, Yanoshik, Miller, & O’Connor, 1993) and resources (Litosseliti, 2003).

several, nonexclusive index-codes and be open to a number of possible interpretations. The final interpretation is postponed until the piece of data can be compared with all the other data having the same index-codes. Thus, emphasis is on inclusiveness rather than exclusiveness. Further information on data indexing can be found in Barbour and Kitzinger (1999).

Analysis of focus group data can take a wide range of approaches, from speedy, highly subjective impressionistic analysis to sophisticated computer-assisted types of analysis. There is no best approach. Rather, the approach used should be consistent with the original purpose of the research.

Strengths and Weaknesses of the Focus Group

Like all other research methods, the focus group interview has its strengths and weaknesses as listed in Table 2.

Ethical Issues

A research study is governed by moral values and principles that act to protect all involved during the research process. As in other methods of social research, there are a number of important ethical decisions in the planning of a focus group interview. Even before embarking on a focus group, a decision must be made on how much information should be given to respondents about the research in an honest and truthful way. Also, let respondents know from the beginning what is expected of the group (Gibbs, 1997), for example,

freedom to speak, no pressure to speak or provide answers, and how much to disclose. Tell them their discussion may be recorded, observed, or both and provide reasons why.

Assure respondents that their contributions will be kept confidential although the issue of confidentiality in a focus group discussion may be more difficult because what respondents say is shared with others in the group. However, effort must be made to keep data obtained anonymous and any publication of such data should be done in such a way as to protect the identity of respondents. Respondents in focus group discussions are expected to keep confidential what they hear during the sessions.

Foreign Accent

ROY C. MAJOR

One of the first things a native speaker (NS) notices about a non-native speaker (NNS) is a foreign accent. Curiously, even listeners unfamiliar with a language can identify a foreign accent in that language, suggesting that foreign-accent recognition may involve salient universal perceptual factors (Major, 2007). A foreign accent is a pronunciation deviating from what a NS expects another NS to sound like. For example, a NS of American English pronounces *bet* and *bat* differently but a NNS might pronounce them identically. A foreign accent occurs because a NNS's foreign-language system (the *interlanguage*) is different from a NS's. Even NSs of different dialects of the same language have different linguistic systems; for example, in some parts of the USA *Dawn* and *Don* are pronounced identically, but in other areas they are pronounced differently. If the NNS's interlanguage progresses to the point where it is identical to the language of a NS then the NNS has no foreign accent, an accomplishment that becomes less and less common as second language learners grow older. The degree of foreign accent can be measured by various means (Flege, Munro, & Mackay, 1995; Flege, Frieda, & Nozawa, 1997; Munro & Derwing, 1998; Southwood & Flege, 1999; Major, Fitzmaurice, Bunta, & Balasubramanian, 2002; Munro, Derwing, & Morton, 2006), the most common being listeners judging speakers as native or non-native or rating them on a scale ranging from "no foreign accent" to "very heavy foreign accent." Heavy foreign accents can hinder intelligibility. However, there are many compounding factors (Munro & Derwing, 1998, 2001; Munro et al., 2006; Major, 2007), such as speaking rate, familiarity with particular accents, and attitudes ("I can't understand 'those people'" vs. "I love an x accent and I have no trouble understanding x-speakers").

For our purposes, "first language" (L1) refers to the person's first or native language. "Foreign language" and "second language" (L2) will be used synonymously, regardless of whether the language is the second, third, fourth, or *n*th language.

Why Is a Foreign Accent so Difficult to Overcome?

It is commonly observed that adult L2 learners rarely achieve native pronunciation, although they may master other aspects of the language. However, this observation can be misleading. Imagine you are an intermediate learner of English engaging in small talk for two minutes. You may be able to avoid certain vocabulary, complex grammar, and abstract topics and thus produce native grammar and vocabulary that does not reveal any shortcomings in your knowledge of these aspects of language. However, if you have pronunciation problems with /r/ and /l/, it would be next to impossible to avoid all words with /r/ and /l/, even for 30 seconds. Your foreign accent thus exposes you soon after you open your mouth, but your grammar and vocabulary may not. (Note: sounds, not letters, are represented between slashes / / or square brackets [], for example the last sound in *rough* is /f/ or [f].)

Another reason why foreign accent is so noticeable is that it is easily detectable by degrees. When the pronunciation is just a little off a NS can hear slight differences: "Her /r/ isn't quite right" or "His /s/ sounds like a Texan but the rest of his accent doesn't."

However, for much of the basic grammar of a language, it is either native or non-native—there is no in between: “I she like” is non-native and “I like her” is native. Accent versus grammar is somewhat analogous to playing a violin versus playing a piano. On the piano you either hit the right note or you don’t, but on a violin, if you can only almost hit the right note, it sounds terrible.

The amount of exposure to and use of the L2 and L1 can affect foreign accent. In general, the more L2 exposure and use and the less L1 use, the more native-like the L2 accent (Flege et al., 1997; Moyer, 2004). Age of learning the L2 is even more important. The notion that after a certain age (commonly believed to be puberty) it is impossible to learn an L2 with native mastery is called the critical period or the critical period hypothesis (first proposed by Lenneberg, 1967, for L1 acquisition). There is mixed evidence for the existence of a critical period for grammar and cultural phenomena because it is virtually impossible to test all grammatical and sociocultural knowledge of an L2 speaker.

Debate also exists regarding the role of the critical period in accent. Although the vast majority of studies on accent demonstrates that, when learning a foreign language, the younger the better (Asher & Garcia, 1969; Oyama, 1976; Munro, Flege, & MacKay, 1996; Scovel, 2000), a handful of studies demonstrate that highly gifted L2 speakers can pass for native, suggesting that there may be no critical period (Ioup, Boustangui, El Tigi, & Moselle, 1994; Bongaerts, Van Summeren, Planken, & Schils, 1997; Moyer, 1999). Regardless of whether one argues that age is a critical factor, all researchers acknowledge that age is inextricably linked to social, cultural, and psychological factors, such as attitudes toward the target language and culture.

Moyer (2007) found positive orientation an important factor in achieving a more native-like accent. However, having a positive attitude does not necessarily correlate with the desire to sound native. It is well known that one’s accent is a mark of identity, be it a regional dialect or an L2. Americans can order sushi, soufflé, tacos, and baklava without ever feeling like they will lose their national identity, but when one starts sounding like a native in the L2, the speakers of that person’s L1 may reject him or her as abandoning them: “You’ve left us”; “You’ve been gone too long.” Age may play a role in such attitudes. For instance, a 3-year-old would probably not have issues with cultural identity because it has not been firmly established. However, in US high school foreign-language classrooms, teachers often remark that students with very good pronunciation are often considered show-offs by their fellow students. This is somewhat akin to adult NSs of English who may seem just as pretentious when they flaunt their near-native pronunciation of foreign words such as *Bach*, *Debussy*, *van Gogh*, *de rigueur*. Furthermore, a society’s prevailing attitudes toward various accents can influence speakers’ desires to overcome their own accents. It is commonly observed that many British and French immigrants to the USA do not lose much of their foreign accents, but these accents generally have higher prestige than many other accents, for example a Spanish or Middle Eastern accent.

Two Main Linguistic Sources of Foreign Accent: L1 Transfer and Universals

L1 transfer occurs if the phonology (sound system) of the L1 operates when speaking the L2. Transfer can be positive or negative. *Positive transfer* occurs when L2 and L1 phenomena are the same, a free ride so to speak. For example, because French and English both have a /ʃ/ (the *sh* sound in *she*) a French speaker and an English speaker have no problems with /ʃ/ in each other’s language. However, *negative transfer* or *interference* occurs when L2 and L1 phenomena are different, which results in a foreign accent. A NS of English who recognizes a French, Spanish, or Japanese accent can do so because of negative transfer.

Spanish speakers of English often have problems with English /ʃ/ and substitute a /tʃ/ sound (the *ch* sound in *cheese*) because most varieties of Spanish have a /tʃ/ but no /ʃ/ sound. In contrast, Spanish speakers also transfer their /tʃ/ to English /tʃ/, a case of positive transfer. (To listen to examples of different accents of English see <http://web.ku.edu/~idea/>.) Note that because French has no /tʃ/ sound French speakers would tend to transfer their /ʃ/ sound to English, a case of negative transfer. Thus, what can be positive transfer in one language can be negative transfer in another language. These examples above are called *sound substitution*.

Transfer encompasses not only sound substitution, but also *phonological processes*, which affect how the basic sounds are pronounced in different positions in a word. Try this experiment. Place your hand close to your lips. Pronounce *spare* and then *pair*. If you are a NS of English you will feel much more air expelled for *pair* than for *spare*. Dutch, French, Portuguese, Spanish, and a host of other languages do not have this *aspiration* (in this case, the basic /p/ sound is more precisely represented phonetically as [p^h]) and English speakers pronouncing these languages will tend to automatically produce [p^h] when speaking these L2s, giving them a foreign accent. (Therefore, a NS of English pronouncing French *père* 'father' may pronounce the first sound as [p^h] instead of [p], and the same process may also apply to /t/ and /k/.) Such processes are largely unconscious to NSs. In contrast, NSs are very aware of the basic sounds (phonemes) of their own language (represented by //), for example, an English speaker knows /s/ and /z/ are different sounds (regardless of spelling: *lazy*, *easy*, *greasy*), but probably is unaware that the *k* in *kill* and *skill* are different (i.e., [k^h] and [k]).

A third type of transfer is called *phonotactic transfer*, which concerns the sound patterns of a language—for example, which sounds can begin or end a word (in English a word can end but not begin with an *ng* sound), what sounds can occur next to other sounds (Spanish has /s/, /p/, and /r/ but a word cannot begin with /spr/ or end with /rps/ as in English *spray* or *harps*), and how syllables are made up (in Japanese, Italian, or Portuguese a syllable usually has to end with a vowel). Thus, Japanese, Italian, and Portuguese speakers may insert vowels and pronounce *dog* as *dogu*, *dogay*, and *doggy* respectively, and a Spanish speaker may say *espray* for *spray*. The same phenomenon occurs when foreign (loan) words are adopted into the language: In Brazilian Portuguese, *picnic* and *Big Mac* are pronounced *peekyneeky* and *Biggy Macky* and in Japanese, *Big Mac* and *McDonald's* are pronounced *Biggu Macku* and *Makudonarudo*.

Another type of transfer occurs at the level of *prosody*. Prosody includes stress, pitch, intonation, rhythm, and even voice quality (e.g., sounding nasal, breathy, or guttural). An Italian may speak English with Italian intonation and a French speaker may tend to stress the last syllables in English. The rhythm of languages also differs. Spanish tends to have syllables of equal length regardless of stress, whereas in English the stressed syllables are much longer than the unstressed syllables. Compare, for example, the pronunciation of the same word, *banana*, in English and in Spanish (*plátano* in some Spanish dialects). English speakers will tend to cut short the unstressed syllables when speaking Spanish (the first and last syllable in *banana*), giving them a foreign accent.

Speech style can also influence foreign accent. Generally, the more careful the style, the less foreign accent there is. A NS of English who studies Chinese for six months and practices daily pronouncing the word for *mother* (*ma*, which has a high-level tone in Mandarin) may after six months sound native for this one word, but most probably the same person will have a foreign accent in conversation. Transfer operates across styles. Accordingly, an L1 phenomenon that occurs only in casual speech will usually transfer to casual speech in the L2 but not to the formal variety. For example, in informal speech in Japanese and Brazilian Portuguese vowels become whispered and deleted. Thus, Japanese *sukiyaki* sounds like *skiyaki* and Portuguese *lápiz* 'pencil' sounds like *laps*. Curiously and

fortuitously for these speakers, accuracy for some words in English can actually be better in casual speech. Thus, in careful speech a Japanese speaker of English may say *sukai* for *sky* but in running speech may pronounce it accurately. Likewise, a Brazilian carefully pronouncing *laps* might say *lapeess*, but in running speech pronounces it accurately.

Although transfer is important in foreign accent, some substitutions cannot be traced to the L1. Such instances are called *universal substitutions* because, regardless of the language, they are common in first language acquisition, yet they do not occur in adult NSs of that language. Nemser (1971) reported that when pronouncing English /θ/ (the first sound in *thick*) Hungarian learners produced [sθ], which occurs neither in native English nor in Hungarian. Major (1986) found that American English speakers learning Spanish /r/ used a sound that was neither native Spanish nor English; rather it was made in the back of the mouth, similar to a French or German *r*-sound (phonetically [ʁ]), even though none of the speakers had studied French or German). Overgeneralization is another example of universals. The band Sublime's "Caress Me Down" is in English and Spanish. In a live performance (<http://www.youtube.com/watch?v=fvEj5iZMEpU>), the lead singer pronounces the Spanish trilled /r/ accurately but he also pronounces the single *r* between vowels in the same way, unlike NSs of Spanish, who make a distinction (the *r* in *perro* 'dog' is trilled [r], whereas in *pero* 'but' it is [ɾ], similar to the *tt* in English *gotta go*). Listen to the following footage: *quiere* 1:28, *ahorita* 1:29, *trataron* 1:33, *dinero* 1:41. Similarly, in "Toes" (Zac Brown Band: <http://www.youtube.com/watch?v=IB8Nkn3Xjes>, 3:00) the *rs* in *señoritas*, *quiero*, and *dinero* are pronounced inaccurately with the trill. All of the above examples are called universal substitutions because they cannot be attributed to the L1 or L2 and in fact they occur in children learning their first languages. Children often overgeneralize rules and patterns of sounds and substitute various non-adult NS sounds when learning their L1s. L2 speakers that sound near-native but not quite native often produce universal substitutions. A speaker's accent may not sound like a Spanish, French, German, or Russian accent, even though the speaker's L1 is one of these languages. Perhaps the /r/ is a little strange or exaggerated, but definitely not a Spanish, French, German, or Russian *r*-sound.

An L2 speaker whose accent is the result of universals is generally more advanced than one whose accent is the exclusive product of transfer. Transfer demonstrates a lack of mastery of the L2, in other words absence of learning. It could be said that a person with the heaviest of accents is in fact not using the L2 phonological system at all (although they might still be using the lexicon and grammar of L2): The speaker is merely using the L1 system—but using all foreign words. On the other hand, substituting something other than L1 phenomena demonstrates progress, even though it might not be native-sounding. The notion that universals represent a more advanced stage was proposed by Major (1987, 2001). His ontogeny phylogeny model claims that, at initial stages of L1 acquisition, transfer predominates and over time decreases, but at initial stages universal factors are infrequent, and then they gradually increase and finally gradually decrease. Major also proposes that these same patterns hold as style becomes more formal. For example, transfer is more frequent in casual speech than in reading a word list. In simple terms, the model means that learners start with what they know (L1). Later they attempt something new, though not getting it right (universals). For style, in reading a word list they can overcome their L1 accent but in casual conversation they concentrate on the topic, not pronunciation, so the L1 accent surfaces.

Why Are Some Phenomena More Difficult to Learn Than Others?

Difficulty often occurs when L1 and L2 phenomena are similar. Oller and Ziahosseiny (1970) found that speakers whose native languages did not use the Roman alphabet made

fewer spelling errors in English than speakers whose languages did. Although limited to spelling, their study implies that, if any L1 and L2 phenomena are very similar, the L2 speaker may not notice differences and may continue to substitute the L1, never mastering the L2. In the speaker's mind "a rose is a rose is a rose is a rose" can be translated as "a /p/ is a /p/ is a /p/ is a /p/." Thus, an English speaker thinks of English /p/ as the same as French /p/, and uses the English aspirated [p^h] for French unaspirated [p] (see example above for *père/pair*). The L2 speaker thinks it is accurate but the L1 listener notices that something is slightly off. Taking an example from German, the German /u/ sound (e.g., *du* 'you') is made much farther back in the mouth than the /u/ in most American and British dialects of English, so the English /u/ sounds non-native to a German speaker, even though English speakers may think English and German /u/ have the same sound. A third example from Brazilian Portuguese concerns the sound /v/. Portuguese /v/ is made with much more friction than English /v/ so an English /v/ in Portuguese sounds like a Spanish accent to Brazilians. Flege's speech learning model (1995) captures the effect of similarity on L2 acquisition. It claims that similar sounds are harder to learn than dissimilar sounds because speakers classify similar sounds as "equivalent" (his term). Flege and others have carried out dozens of studies supporting this claim, often finding learners able to master dissimilar sounds but not equivalent sounds. Major's ontogeny phylogeny model (2001) adds to this notion, by claiming that similar phenomena are acquired very slowly because L1 transfer predominates, and as a consequence universal factors are relatively unimportant compared to L1 transfer. However, one problem with any claims about similarity is that it is often difficult to precisely define "similar" and "dissimilar."

In addition to L1/L2 similarity there are some phenomena that are intrinsically difficult to learn, regardless of one's L1. These *marked* phenomena are rare in the languages of the world and in L1 acquisition are acquired after other phenomena. American English /r/, a marked sound, occurs in only about five percent of the languages of the world (Maddieson, 1984), and children learning English as their first language usually experience difficulty with /r/. Most 2-year-olds have no trouble pronouncing *Mommy* but much trouble pronouncing *cereal*. Likewise, in L2 acquisition, marked phenomena are difficult to master. Arabic has two types of *k*-like sounds, one similar to English and one made much farther back in the mouth (phonetically [q]; in Arabic, the first sound in *Koran* is [q], not [k]). Making these two different sounds is difficult for speakers whose L1s have only [k] (which includes most languages of the world). Navajo and Amharic have *ejectives*, difficult sounds for L2 learners whose L1s do not have them (most languages of the world). The Navajo word for arrow is *k'a'* (listen to <http://www.phonetics.ucla.edu/course/chapter11/navajo/n15.aiff>). *Clicks* occur in many South African languages (see the film "The Gods Must Be Crazy" and "The Click Song" by Miriam Makeba, heard widely in the USA in the 1960s: <http://www.youtube.com/watch?v=2Mwh9z58iAU>). Although many languages make *click* sounds in interjections, such as English *tsk tsk* or *giddy up* (and even the sounds infants make when sucking and kissing are technically clicks), the numerous clicks made in such languages as Xhosa and !Kung are difficult for L2 learners (Xhosa has 18 different clicks).

Eckman (1977) was the first researcher to formalize the effects of markedness in L2 acquisition. His markedness differential hypothesis claims that unmarked phenomena are acquired before marked phenomena. Major's ontogeny phylogeny model (2001) also addresses markedness: Marked phenomena are acquired more slowly than unmarked phenomena and the role of universals is much greater than the role of L1 transfer, in contrast to similar phenomena where these roles are reversed. The reason why universals are more prevalent in more marked phenomena is that after the initial stages of L1 transfer the speaker attempts a non-L1 sound but does not hit the L2 target accurately, resulting in a universal substitution. Another reason why universal substitutions are prevalent in marked phenomena is that there may be no similar L1 sounds. For example, there are

no obvious English consonants equivalent to Xhosa clicks. Because marked phenomena are difficult, the learner repeatedly fails to hit the L2 target, using a range of universal substitutions.

Conclusion

The formation and change in an individual's foreign accent is governed by many inter-related factors. Non-linguistic factors include L2 exposure, L1 and L2 use, age of learning, and sociocultural and psychological factors, such as attitudes toward the target language. The two most important linguistic factors are L1 transfer and universals. In turn, a listener's perception of a foreign accent is influenced by all of the above factors.

Foreign-Language Distance Learning Programs

CYNTHIA WHITE

In foreign-language programs, learning and teaching have traditionally taken place in close proximity, and at particular points in time. A defining feature of distance language programs is the separation in physical space, time, or both space and time between sources of instruction and learners, with the distance being mediated by technology. Early forms of distance language programs were developed according to two distinct approaches: the American model comprised group-based learning delivered by satellite or videoconferencing technologies while the European model centered on print-based independent learning opportunities, supplemented later by the use of the telephone, face-to-face opportunities, audio, video and CD-ROM. The advent of computer-mediated communication (CMC) which provided opportunities to take part in synchronous and asynchronous learning events with others online then superseded both models. The structures of distance language programs remain, however, diverse (Blake, 2009) and include various permutations of media use, interaction, and support: print-based courses with online support systems, classes delivered via satellite to different sites augmented by interactive opportunities online and Web 2.0 tools, and podcasts supplemented by text-based materials and chat facilities, are all examples of distance language programs. Theorizing of distance language learning has developed through research into instructional voice (Holmberg, 1985), learner autonomy (White, 2003, 2007), task-based language teaching (Doughty & Long, 2003), teacher expertise (Hampel & Stickler, 2005; Levy, Wang, & Chen, 2009) and identity (White, 2007). The learner–context interface theory (White, 2009), for example, frames distance learning as a form of critical adaptive learning, encompassing how individual learners construct their learning environment, negotiate meaning, and regulate both themselves and their context. Important lines of enquiry in foreign-language distance learning programs concern course development, task design, learner support, teacher expertise, affective aspects of distance learning, and questions relating to innovation and best practice.

Developing appropriate resources is often perceived as the central challenge for distance language learning, and much attention has been given to the process of constructing course content. In earlier course models, predetermined content functioned as the main source of instruction stressing the importance of providing a “teaching voice” within the materials and developing a “guided didactic conversation” with learners (Holmberg, 1985). Emphasis was also placed on developing materials which fostered learner engagement with the content and developed independent learning skills through the use of self-assessment questions and reflective action guides. The explicit philosophy underpinning such language programs was to adopt a preemptive approach to supporting learners by anticipating their needs and difficulties, and endeavoring to equip them with all the learning resources, skills, and strategies they would need (Hurd, Beaven, & Ortega, 2001). Candlin and Byrnes (1985) broke new ground with a contrasting approach based on the development of open materials as the core of distance language programs: their open curriculum encouraged learners to go beyond the course materials to engage with language resources in their environment and to make choices in terms of the content and goals of their learning.

2 FOREIGN-LANGUAGE DISTANCE LEARNING PROGRAMS

As a pedagogical innovation it represented a fundamental shift in what was considered possible in teaching at a distance, and elements of this approach were incorporated into subsequent language programs. More recently attention has been given to developing opportunities for CMC-based interactions and increasingly rich multimedia delivered via the Web (Blake, 2005), as well as to opportunities that encourage learners to participate in authentic social computing networks (Tudini, 2007).

Task design in distance foreign-language programs has been informed by cognitive and interactionist SLA theory (Reinders & White, 2010), most notably through the contribution of Doughty and Long (2003). The ten design principles they identify are concerned with activities, input, learning processes and learners, and how these may be implemented in a distance learning context. Doughty and Long's framework has guided task design in videoconferencing, audiographic conferencing, and multimodal environments as well as enquiry into interaction and negotiation of meaning in those environments. Important avenues of research have included tracing how the materiality of multimodal environments influences learners' and teachers' responses to different task features, and the activities developing around tasks.

The nature of teacher expertise in distance language programs has been explored to a significantly lesser degree than in face-to-face classroom settings. Moving from classroom settings to teach languages at a distance involves shifts in three broad areas: learning to use new forms of communication and interaction, developing skills in and awareness of new and unfamiliar domains, and adjusting to the complex scale of processes in developing and delivering distance language programs. These changes require distance language teachers not only to develop new teaching practices in new mediums but to undergo a shift in their identity as language teachers (White, 2007) and their understanding of language teaching and learning activities. A taxonomy of skills for teaching languages online has been developed based on distance language programs and beginning with more general skills of working with the technology and its constraints and possibilities, then moving on to the social skills of community building, with the highest level comprising skills in teaching languages creatively and developing a personal teaching style online (Hampel & Stickler, 2005). Opportunities to develop both technological and pedagogical skills have included experiential learning events where teachers are learners, virtual peer support networks based on sharing responses and experiences (Ernest & Hopkins, 2006), and online practice teaching, including both individual teacher lessons and team teacher sessions (Levy et al., 2009). Investigations into student perceptions of the qualities of effective distance tutors have emphasized the importance of affective and organizational dimensions of tutor engagement (Murphy, Shelley, & Baumann, 2010).

Learner support is integral to the quality of learning and teaching experiences in distance language programs: it involves interacting with learners about their needs, interests, priorities, concerns, choices, and reflections on their learning as they emerge throughout a course. Support comprises cognitive, affective, and organizational dimensions (White, 2003) including, for example, providing feedback on target language use, paying attention to the morale, motivation and agency of learners, providing technical support, or enrollment advice and troubleshooting online. One of the earliest studies into feedback came from Hyland (2001) who highlighted the critical role of feedback in not only responding to students' performance, but in guiding the way students engage with the course and the strategies they use; feedback as a means of demonstrating interest in students' learning and providing encouragement was also emphasized. Importantly, the study highlights the situated nature of feedback, and argues for both teacher training in providing feedback and learner training in making effective use of it. Research in different contexts reveals that it is difficult to make generalizations about learner support since it tends to be a highly

situated, pragmatic activity, influenced by institutional climates and such sociocultural factors as student expectations, teacher expertise, and ideas about how students learn language at a distance. Dreyer, Bangeni, and Nel (2005) document their research into the needs of higher education students developing English for tertiary study in South Africa; they argue for the value of a contextual, proactive approach in setting up support programs which, it is argued, need to be responsive to the dynamic nature of individual learners as they progress through a course as well to the continuously changing contextual factors impacting on language learning.

The role of affect in learning a language at a distance is a more recent avenue of enquiry and relates to the more isolated study context, separation from peers and the teacher, and reduced or altered forms of social contact and interaction. In terms of emotions, the predominant focus has been on anxiety (Hurd, 2007), on the aspects of language learning that give rise to emotions, and on the regulation of negative affective states through such strategies as self-reinforcement, self-encouragement, self-motivation, and self-talk (White, 2003). Specific aspects of course design and delivery identified by students as facilitating a positive learning experience include ensuring clarity in materials, providing encouraging feedback, and careful scaffolding of tasks particularly at beginner levels, and giving support that takes account of the personality characteristics and life stages of learners (Hurd, 2007). Both motivation and confidence in one's capacity to cope with the challenges of distance learning have been identified as central to success (White, 1999), as have locus of learning and affective strategy use (Bown, 2006).

Foreign-language distance learning programs now hold an important place in the landscape of language-learning opportunities, offering flexible access to increasingly rich learning environments. Research into distance learning programs has now entered its fourth decade with evidence of a growing interplay between theorizing, research, and practice particularly in course development and task design, teacher learning, affective dimensions of distance language-learning processes, and the affordances of particular learning environments. In an important recent article Blake (2009) explores the particular challenges of research into distance language programs while providing compelling arguments for further enquiry into the effectiveness of distance learning for languages and best practices in distance pedagogy. While the emergence of distributed and blended learning opportunities has blurred the distinction between distance programs and classroom programs, it has revealed clear gaps in our knowledge to guide the articulation of distance learning environments into more traditional course formats, and how these relate to curricular and pedagogical goals. Pursuing that avenue of enquiry is a key challenge for the field, and will shed further light on both the potential and affordances of distance language programs.

Foreign-Language Teaching for Students With Language-Learning Problems

RICHARD L. SPARKS

Learning disability (LD) is a generic term that describes academic learning problems in reading, writing, and mathematics. As specified by US federal law, LD is defined as follows:

A disorder in one or more of the basic psychological processes included in understanding or using language, spoken or written, that may manifest itself in an imperfect ability to listen, think, speak, read, write, spell, or do mathematical calculations . . . the term does not include children who have learning disabilities, which are primarily the result of visual, hearing, or motor handicaps, or mental retardation, or emotional disturbance, or of environmental, cultural, or economic disadvantage. (US Department of Education, 1968, p. 34)

Since the term was first coined by Dr. Samuel Kirk in 1963, LD has proven to be one of the most confusing, contentious, and contradictory of the disabling conditions. In fact, no single problem has plagued research in LDs more than the lack of an empirically valid definition for LD (Fletcher, Lyon, Fuchs, & Barnes, 2007). Consequently, the field has also been unable to reach consensus on a logically consistent, easily operationalized, and empirically valid classification system for diagnosing students as LD. For example, students have traditionally been classified as LD on the basis of discrepancies between their scores on standardized measures of intelligence (IQ) and achievement, that is, reading, math, and written language. However, research since the late 1980s has found this approach does not yield a group of learners with common cognitive or achievement profiles. As a result, students classified as LD constitute a heterogeneous group and are not distinguished in meaningful ways from students with generic learning problems. For example, poor readers classified as LD exhibit the same pattern of information-processing deficits, that is, phonological processing, as poor readers not classified as LD (Stanovich, 2005).

In terms of teaching foreign languages, too, the LD label has generated considerable confusion. The purpose of this entry is to review and describe (a) the relationship between first language (L1) and second language (L2) learning problems, (b) research on L2 learning problems, and (c) research on teaching strategies for low-achieving and at-risk L2 learners. The work reviewed in this entry has been largely conducted in the United States and concerns foreign-language (L2) learning that begins in high school.

Linguistic Coding Differences Hypothesis and L2 Learning Problems

Sparks and Ganschow proposed the linguistic coding differences hypothesis (LCDH) to explain why students exhibited L2 learning problems and to demonstrate the connections

between L1 and L2 learning (Sparks, 1995; Sparks & Ganschow, 1995). In the LCDH they speculated that (a) L1 skills serve as the foundation for L2 learning; (b) both L1 and L2 learning depend on basic language-learning mechanisms; and (c) problems with one component of language, for example, phonological processing, will have a negative effect on both L1 and L2 learning. In addition, they speculated that students with L1 learning problems would likely have lower L2 aptitude. The authors' studies (e.g., see reviews in Ganschow & Sparks, 2001; Sparks, Patton, Ganschow, & Humbach, 2009a, 2009b) as well as research in other contexts, for example, in Finnish and Hebrew (see Dufva & Voeten, 1999; Kahn-Horwitz, Shimron, & Sparks, 2006), have supported the tenets of the LCDH.

Initially, the LCDH was applied to the problems of students classified as LD. As LD students began to enroll in L2 classrooms in the late 1980s and early 1990s, both foreign language (FL) and special educators *assumed* that these students would experience L2 learning problems because LDs are generally language based and L2 learning involves the learning of language. For example, in the early 1990s, the author of this entry and his colleagues, all of whom are LD specialists, described links between language-based LDs and L2 learning and initially used the term *foreign-language learning disability* to describe students' problems with L2 learning. However, they quickly changed their minds when their research findings revealed that there were no differences between L2 learners classified as LD and other low-achieving (non-LD) L2 learners. Studies over the next 15 years confirmed these findings and have shown that there is not a unique "disability" for L2 learning (Sparks, 2006).

Research on L2 Learning Problems
